Auchinleck, an Ayrshire village, 15 miles E. of Ayr by rail. Pop. (1881) 1528. The park contains Auchinleck House (locally called 'Fla-Affleck'), the seat of the Boswell family. Here, beside this mansion, Sir Alexander Boswell, son of Johnson's biographer, established in 1815 the *Auchinleck Press*, for printing MSS. and networks, such as the *Romance of Sir Tristrem*; 'Disputation between John Knox and the Abbot Crossraguel, &c.'

Auchterarder, a Perthshire village, 14½ miles SW. of Perth by rail. Pop. (1881) 2666, largely employed in the woollen manufacture. The popular opposition to the presentee to the church of Auchterarder originated (1834) the struggle which ended in the secession from the Church of Scotland and the formation of the Free Church in 1843.

Auckland, the northern provincial district of New Zealand, includes fully a half of North Island and is about 400 miles long by 200 wide at its greatest breadth. The bays of its coast-line afford safe harbours, and its rivers serve as highways for the produce of the interior. There are three almost natural divisions of this district: North Peninsula, East Coast, and the Waikato Country—the latter two, which had been mainly in the hands of the natives, have lately been opened up for European settlement. The

is chiefly of two kinds—a light volcanic loam, and a stiff yellow clay. For the most part it is broken, with low ranges of hills and broad shallow valleys, covered to a great extent with dense forests. It is less suited for grazing than for agricultural purposes. Gold, copper, tin, iron, coal, and other minerals exist in Auckland, which is also very rich in timber, the most important tree being the Kauri pine. The fossil gum of ancient forests of this pine is dug up in large quantities, and exported. Much New Zealand flax is grown and manufactured. About 200 miles of railway give connection with the agricultural districts. The annual value of the exports, including wool, Kauri gum, timber, flax, and gold, averages £1,000,000; the imports are double that amount. The value of the gold exported from 1857 to 1885 was £5,350,287. The climate is pleasant and healthy, and owing to sea-breezes, the summer heat is not so great as in other parts of Australasia in the same latitude. Ferns grow in perfection, upwards of 130 species being found. Volcanic action has deeply left its mark on the surface of Auckland; there is still an active volcano near the city of Auckland; and the warm lake and geyser scenery of the region about 90 miles SE. from Auckland, below the Bay of Plenty, is considered by travellers the most remarkable in the world. The 'Hot Lake' district covers an area about 120 miles long, by 10 to 15 miles wide, and includes hot springs, cisterns of hot water, and mud volcanoes. A sanatorium for bathing purposes exists near Lake Taupo, and at Ohinenutu on Rotoma. The other lakes are Tarawera, Rotoiti, and Rotomahana. The wonderful pink and white terraces near Tarawera Lake were destroyed by a volcanic eruption in 1886. The white terrace, which had the appearance of a crystal staircase, glittering and stainless, as of ice, was produced by deposits of silica from the boiling springs; the pink terrace, its companion, was flushed with a pale rose colour, believed to have been caused by the presence of oxide of iron. Auckland was the scene of the labours of Bishops Selwyn and Patteson. The population in 1875 was 79,104; (1881) 99,451; (1891) 133,287.

Auckland, the largest city in the North Island of New Zealand, situated on a peninsula about 7 miles wide on the Hauraki Gulf. It stands on the south side of Waitemata Harbour, one of the finest harbours in New Zealand, with sufficient depth of water for the largest steamers afloat; and its splendid wharves and graving-docks offer the most complete facilities for shipping. Auckland is distant from Sydney 1315 miles; from Melbourne, 1650; and has regular steam communication with both. It possesses also a harbour on the western side of the island in Manukau, only six miles across. It is surrounded by numerous thriving villages, with several of which it is connected by railway. Auckland contains a well laid out botanical garden and two public parks, and shows numerous public buildings, government house, exchange, post-office, custom-house, banks, hotels, churches, and barracks. Most of the stores and shops are of a substantial character. It has a university college and cathedral, and the foundation stone of a Free Library and Art Gallery was laid in 1885. The temperature is singularly equable and free from extremes of heat and cold: the mean average temperature in shade is 59° F. The industrial establishments include boiler and glass works, saw-mills, shipbuilding, vinegar and rope works; sugar refinery, boot factory, &c. Auckland has connection with all the chief centres of New Zealand by telegraph. About 230 sailing vessels and 62 steamers are registered as belonging to the port. Pop. (1881) 16,675; but including suburban districts,

30,952; (1891) borough, 28,773; with suburbs, 51,287. The city was founded in 1840, and was named in honour of Lord Auckland, then governor-general of India. It was the capital of New Zealand up to 1865.

Auckland, WILLIAM EDEN, LORD, statesman and diplomatist, third son of Sir Robert Eden, Bart., of West Auckland, Durham, was born in 1744, educated at Eton and Oxford, and called to the bar in 1768. In 1772 he was appointed Under-secretary of State, and afterwards filled the offices of Lord of Trade, commissioner to treat with the American insurgents, chief secretary to the Irish viceroy, minister-plenipotentiary to France (concluding a commercial treaty with that country, 1786), ambassador to Spain, ambassador to Holland, and postmaster-general. In 1788 he was raised to the Irish, in 1793 to the British, peerage as Baron Auckland. He died May 28, 1814. Besides *Principles of the Penal Law* (1771), we have his *Journal and Correspondence* (4 vols. 1860-62).—His son, GEORGE EDEN, EARL OF AUCKLAND, was born in 1784, and in 1814 succeeded as Lord Auckland. A steadfast supporter of Reform, he held two or three offices, and in 1835 was appointed governor-general of India. As such, in 1838, he plunged into the unhappy Afghan war, whose successful beginning procured him the title of Earl of Auckland. Superseded in 1841, he returned to England, and died unmarried, January 1, 1849.

Auckland Islands, a group of islands about 180 miles to the south of New Zealand. The largest of them measures 30 miles by 15. It has two good harbours, and is covered with the richest vegetation. The Auckland Islands are valuable chiefly as a whaling station, but are not peopled. They were annexed by Great Britain in May 1886.

Auction (Lat. *auctio*). The character of this convenient mode of offering property for sale is correctly indicated by the name, which means an arrangement for increasing the price by exciting competition amongst purchasers. In the *Dutch Auction* of the 'Cheap Jack,' the usual mode of proceeding is reversed, the property being offered at a higher price than that which the seller is willing to accept, and gradually lowered till a purchaser is found. The *Scottish roup* differs from the ordinary auction in having a judge of roup, and in sales of land an 'upset' price. In sales for redemption of land-tax in England, the bidding is often for the smallest quantity of land to be taken for a fixed sum. 'Conditions of Sale,' or 'Articles of Roup,' as they are called in Scotland, constitute the terms on which the seller offers his property, and form an integral part of the contract between seller and purchaser. The contract is completed by the offer or bid on the part of the purchaser, and the acceptance by the seller or his representative, which is formally declared by the fall of the auctioneer's or salesman's hammer, the running of a sandglass, the burning of an inch of candle (hence the term 'sale by the candle'), or any other means which may have been specified in the conditions of sale. Mere advertisement does not make a contract. These conditions or articles ought further to narrate honestly and fully the character of the object or the nature of the right to be transferred, to regulate the manner of bidding, prescribe the order in which offerers are to be preferred, and to name a person who shall be empowered to determine disputes between bidders, and in cases of doubt to declare which is the purchaser. Before the sale commences, these conditions, which are executed on stamped paper, are read over, or otherwise intimated to intending purchasers, but it is sufficient if they are posted up in the auction room. The conditions, thus published,

cannot be controlled by any verbal declaration by the auctioneer. Even the statements in a catalogue, or particulars of an estate, cannot be varied by statements of auctioneer. It is understood that an auctioneer may puff his goods. The implied conditions, which, in addition to those thus expressed, are binding on the seller and purchaser in all auctions, are: (1) That the seller shall not attempt to raise the price by means of fictitious offers, but shall fairly expose his goods to the competition of purchasers; and (2) That the purchasers shall not combine to suppress competition. It is usual to stipulate for a deposit varying from 5 to 25 per cent. by the purchaser, either with the auctioneer or (in sales of land) with the seller's solicitor. Much doubt has arisen as to the lawfulness of biddings for the exposer, through the auctioneer or by others. The exposer may set a price below which the thing is not to be sold, which is best and most openly done by fixing an upset price, or he may expressly reserve to himself a power to offer. 'But if the sale is declared to be without reserve, or at the pleasure of the company, the plain meaning and effect of this, even in England, is held to be to bar all biddings in behalf of the seller.' 'In Scotland, the law condemns absolutely such interference.' 'It has been said, that if there be no upset price, and no agreement to sell at the pleasure of the company, the owner may bid, but that is not law, or is at least too broadly laid down.' Where an unlawful offer is made for seller, the remedy is to set aside this, and the contract holds with the last *bona-fide* offerer. Nearly all sales by order of court take place by auction, and the same course is directed by numerous statutes, as the Pawnbrokers' Act, the Summary Jurisdiction Act with regard to distresses, &c.

Auctioneer, the person who conducts an Auction (q.v.). The auctioneer is in a certain sense the agent both of seller and purchaser, and by the fall of his hammer, or by writing the purchaser's name in his book, he binds him to accept the article sold at the price indicated. The auctioneer may also, and frequently does, act as agent for absent purchasers, or for persons who have instructed him to make biddings for them during the sale. In both cases, however, the purchaser must be *bona fide*, otherwise the auctioneer would himself become a 'puffer.' As to the circumstances in which he may bid for the seller, see AUCTION. Where the auctioneer declines or omits to disclose the seller's name, he undertakes the responsibilities of the latter to the purchasers. To the seller, again, he is responsible for ordinary skill, assiduity, and prudence. Every auctioneer pays an annual duty of £10 to government for his license, which must be renewed on the 5th July; though there are certain judicial sales which may be conducted by bailiffs without license. But the want of a license does not vitiate the sale. An additional license is required for the sale of excisable goods, but the ordinary license entitles an auctioneer to act also as appraiser. An auctioneer is generally paid by commission on proceeds after deduction of expenses, and this is due even where the owner makes a private sale after an unsuccessful exposure; for this commission the auctioneer has a lien upon the price and goods in his hands. The auctioneer is liable for negligence in the custody of goods sent to him for sale, but he is not liable for the price unless he has received it.

Aucuba, a genus of Cornaceæ (q.v.), of which the familiar, and probably the only true species is *A. japonica*, an evergreen shrub resembling a laurel, but, as seen in Europe, always with pale green leaves curiously mottled with yellow. It is dioecious, and until recently the female plant was

alone in cultivation in Europe. The male, and also the normal green-leaved forms, have now been introduced, and many varieties are now grown. The scarlet berries are therefore becoming more frequently seen as pollination becomes possible.

Aucuba japonica.

The common form has long been largely cultivated as a hardy ornamental shrub, especially in the suburbs of large towns, a situation for which it is well adapted, as it is little liable to suffer injury from smoke. It is often known as the variegated laurel, but has of course no affinity with any of the other plants popularly confused under that name.

Aude (*Atax*), a river in the south of France, rises in the Eastern Pyrenees, not far from Mont-Louis; flows for some time parallel to the canal of Languedoc; and falls into the Mediterranean 5 miles ENE. of Narbonne, after a course of 13 miles.

Aude, a maritime department in the south of France. It comprises some old 'counties' which formerly constituted a portion of the province of Languedoc. Area, 2438 sq. m.; pop. (1886) 332,000. The southern part is occupied by spurs of the Pyrenees, attaining 4037 feet in the Pay de Bugaret; but the greater portion belongs to the valley of the lower Aude, and is bounded to the north by the Cevennes (4018 feet). The coast is flat, with no bays or roadsteads, but several lagoons. The climate is warm, but variable. The mountains are composed of granite, while the soil of the plains is chiefly calcareous, and about the coast—where salt and soda are procured—is extremely fertile, producing cereals, olives, fruits, and wines. Aude is rich in iron and mineral springs, but the coal-mines have been generally abandoned. Wild animals are found, and game of all sorts is plentiful, while the coast abounds in fish. The woollen and silk manufactures are of considerable value. There is likewise a considerable export of cereals and of bees. The chief town is Carcassonne (q.v.).

Audebert, JEAN BAPTISTE, a French naturalist and artist, was born in 1759 at Rochefort, and at Paris attained eminence as a miniature-painter. In 1800 he published a splendid illustrated volume on the monkeys and lemurs, the *Histoire Naturelle des Singes*, a large folio, with coloured plates remarkable alike for their truth and beauty, and in whose production he introduced great improvements in the art of colour-printing in oil. He subsequently prepared a similar work on the

humming-birds (1802), and another on the birds of paradise (1803), which were both completed and published after his death in 1800.

Audh. See OUDH.

Audiometer is a special application of the Telephone (q.v.) for measuring minute differences in the power of hearing.

Audiphone is the name of an invention (1879) by Mr Rhodes of Chicago, to assist the hearing of deaf persons in whom the auditory nerve is not entirely destroyed. The instrument is made of a thin sheet of ebonite rubber or hard vulcanite. It is about the size of a palm-leaf fan, with a handle and strings attached to bend it into a curving form, and a small clamp for fixing the string at the handles. The audiphone is pressed by the deaf person using it against his upper front teeth, with the convex side outwards; when so placed it communicates the vibrations caused by musical sounds or articulate speech to the teeth and bones of the skull, and thence to the organs of hearing. For different sounds, it requires to be focused to different degrees of convexity. A simple strip of fine glazed millboard has been recommended by some experimenters as a cheaper and equally serviceable audiphone; and birch-wood veneer has been used with success for the same purpose.

Audita Querela is a form of action which lies for a defendant to recall or prevent an execution, who has grounds to show that such execution ought not to issue against him, or on account of some matter occurring after judgment amounting to a discharge, which could not have been and cannot be taken advantage of otherwise. It is a remedial process, equitable in its nature, based upon facts, and not upon the erroneous judgment or acts of the court, in which damages may be recovered if execution was improperly issued. In the United States, it has in some states been entirely superseded by relief granted upon motion, while in other states it is recognised by statute and of frequent use. The writ of Audita Querela does not lie against the government.

Auditor, the name given to those who are appointed to examine accounts on behalf either of the government, of courts of law, of corporations, or of private persons. An auditor is usually, but not always, a professional accountant. His duties are to see that all payments and receipts in the accounts submitted to him are instructed by vouchers, or otherwise proved, that the accounts and books are properly kept and stated, and either to certify their accuracy, or point out any error he may discover.

AUDITOR OF THE COURT, in Scotland, is an officer whose duties, like those of *taxing master* in England, consist of taxing the costs of suits in which expenses are found due, a remit being made to him for that purpose by the presiding judge.

AUDIT-OFFICE.—In 1785 public auditors were appointed, under the title of 'Commissioners for Auditing the Public Accounts;' and the patents of the two auditors of the imposts of the Admiralty were vacated, the sum of £7000 per annum being made payable to each of them for life. Many subsequent statutes have been passed for the purpose of extending and defining the duties of these commissioners, and regulating the business of the audit-office. In 1832 the powers and functions of the Commissioners of Public Accounts in Ireland were transferred to the Commissioners for Great Britain. In 1866 an Act was passed, 'to consolidate the powers and duties of the comptroller of Her Majesty's Exchequer and of the Commissioners for Auditing the Public Accounts, and to unite in one department the separate establishments under

them.' That department now consists of a comptroller and auditor-general, an assistant comptroller and auditor, and a large staff of clerks. The Audit Department is empowered to call on all Keepers of Public Accounts to account for moneys or stores intrusted to them. The accounts of Army and Navy, of Land Revenue and the like, are accordingly examined by this branch.

Auditory Nerve, or nerve of hearing, is the *portio mollis* of the seventh pair, distributed to the ear. See EAR, BRAIN, NERVOUS SYSTEM.

Audley, SIR JAMES, one of the original knights of the Order of the Garter, founded in 1344 by Edward III., in 1350 fought in the sea-fight of Sluis, and in 1354 attended Edward the Black Prince to France. He showed such bravery at the battle of Poitiers that the Prince declared him to be the bravest knight on his side, and conferred on him an annual revenue of 500 marks, which Audley immediately gave up to his four squires. Hearing of this act of generosity, the Prince conferred on him a further pension of 600 marks. Audley, in 1362, was governor of Aquitaine; in 1369, great seneschal of Poitou. He took part in the capture of La-Roche-sur-Yon in the same year, and died a few months after at Fontenay-le-Comte.

Audouin, JEAN VICTOR, naturalist, was born at Paris, 27th April 1797, and studied medicine and the natural sciences. Installed in 1833 as professor of Entomology at the Jardin des Plantes, he made special studies on the muscardine (a silkworm disease), the parasites infesting the vine, and other insect pests. He contributed to the scientific journals, wrote a book on the natural history of the French coasts (2 vols. 1830), and edited the section on insects in Cuvier's *Règne Animal*; but his chief work was his *Histoire des Insectes nuisibles à la Vigne* (1842). He died 9th November 1841.

Audran, GÉRARD, French engraver, was born at Lyons in 1640, and after three years at Rome, where he acquired a high reputation by his engraving of Pope Clement IX., was recalled to France by Colbert, and appointed engraver to Louis XIV. Here he engraved the works of Lebrun, illustrating the battles of Alexander, and many paintings by Raphael, Titian, Domenichino, Poussin, and others. He died at Paris in 1703. His nephews, Benoit (1661-1721) and Jean (1667-1756) were also engravers.

Audubon, JOHN JAMES, an eminent American ornithologist, was born on the plantation of his father (an officer in the French navy), near New Orleans, Louisiana, May 4, 1780. His mother was a lady of Spanish extraction, who, after the birth of four children, accompanied her husband to St Domingo, and there perished in the great negro insurrection. Visiting France with his children, the elder Audubon soon married again, settled his family in the city of Nantes, and resumed his duties in the French navy; and it was chiefly through his stepmother's indulgence that young Audubon was enabled to gratify his taste as a naturalist. His father undertook to educate him for the army or navy; but music, drawing, and the collection of natural history specimens usurped the attention that should have been given to mathematics, until finally the lad was sent to America to occupy a property in Eastern Pennsylvania, which his father had previously purchased. Here he lived for some time a sort of Bohemian naturalist, and here he married in 1808 Miss Lucy Bakewell, the daughter of a farmer. Immediately after, he sold his land, bought a stock of goods, and, with his

Company.

wife and a French friend and partner, Rosier, migrated westward to engage in mercantile pursuits. A flat-bottomed boat conveyed the party down the Ohio from Pittsburg to Louisville, Kentucky, where they commenced trade, Audubon, however, spending his time principally away on expeditions with the neighbouring planters hunting birds, while Rosier 'stuck to the counter.' Business so conducted naturally proved unprofitable, and the firm removed first to Hendersonville, Kentucky, and next to St Genevieve, Missouri, where Audubon sold his interest to his partner and returned to Hendersonville. A succession of business misadventures speedily swept away all his funds, when, with 'his sick wife and his gun, his dog, and his drawings,' he returned to Louisville, and engaged in drawing portraits, whereby (here and subsequently in Cincinnati) he supported his family for a while in comfort. In 1820, however, he left Cincinnati, without a dollar, on an excursion down the Ohio and Mississippi rivers, stopping at the principal towns and drawing portraits, and adding at every available opportunity to his already wonderful collection of coloured designs of birds. He records that in one instance he executed portraits of a shoemaker and his wife in payment for two pairs of boots, one of which he gave to a destitute fellow-traveller, reserving the other pair for his scarcely less destitute self. After a precarious existence of this sort for some three years, Audubon visited the cities of the Atlantic coast with the view of publishing his works; but meeting with little encouragement, he returned to Louisiana, and taught classes in dancing. Encouraged and assisted by his wife, who was receiving nearly \$3000 a year as a teacher, he embarked for Europe in 1826, where he was received with great kindness by the leading scientists. Public exhibitions of his drawings in Liverpool and Edinburgh proved successful, and in 1827 he issued the prospectus of his great work, *The Birds of America*, to appear in numbers at two guineas each—each number to consist of five plates. He canvassed the British towns for subscribers, meanwhile painting and selling pictures to defray his current expenses, and in 1828 visited Paris, where his work received the highest encomiums—a report from Cuvier to the Paris Academy of Sciences declaring it 'the most magnificent monument which has yet been erected to ornithology.' The work embraces coloured figures of 1065 species of birds (natural size), the publication of which occupied some ten years, and is said to have cost £20,000 (\$100,000). In the meantime, Audubon visited America, and explored the least known regions of the Atlantic coast from Labrador to the Gulf of Mexico, returning to London, in the interest of his work, in 1837. In 1839 he settled with his family in New York city, visited the Yellowstone River in 1843, and subsequently, assisted by his sons, he published *The Quadrupeds of North America*, largely from materials prepared some years prior by himself and Dr John Bachman of South Carolina. He died 27th January 1851. See *Audubon, the Naturalist, in the New World*, by Mrs Horace St John (1856); *The Life of John J. Audubon, the Naturalist*, edited by his widow (1869).

Auenbrugger von Auenbrug, LEOPOLD, an Austrian physician, born at Gratz in 1722, practised at the Spanish hospital in Vienna, where he died in 1809. As early as 1754 he had discovered the method of investigating internal diseases which afterwards made him famous; but not until after seven years of experiments and verification did he publish his treatise, entitled *Inventum novum ex percussione thoracis humani*

interni pectoris morbos detegendi (Vienna, 1761). See PERCUSSION.

Auerbach, BERTHOLD, German novelist, was born, of Jewish parentage, at Nordstetten, in the Württemberg Black Forest, 28th February 1812. He received his education at the Talmud school of Hechingen, at Carlsruhe, at Stuttgart gymnasium, and at the universities of Tübingen, Munich, and Heidelberg, in 1836 suffering several months imprisonment in the fortress of Hohenasperg as a member of the students' Burschenschaft. He had been destined for the synagogue, but had abandoned theology for law, then law for history and philosophy—the philosophy, above all, of the great thinker of his race, Spinoza. A biographical romance, based on Spinoza's life, succeeded in 1837 his earliest work, *Das Judentum und die neue Litteratur* (1836), and itself was followed by a translation of Spinoza's works (5 vols. 1841), the first series of his *Schwarzwälder Dorfgeschichten* (1843), on which his fame chiefly rests, gives charming pictures of Black Forest life, though his peasants too often are peasant Spinozas. The longer stories—*Barfüssle* (1856), *Jörg im Schnee* (1861), and *Edelweiss* (1861)—are good but not so good; and the three-volume didactic romances of the third and last period of his literary career, though clever of course, are tedious to a degree. These were *Auf der Höhe* (1865), *Das Landhaus am Rhein* (1869), *Waldfried* (1874). As 'philosophical novels, in which,' in his own words, he 'undertook to treat problems of speculative ethics, and dealt not so much with events and actual conflicts in life as with conversation and the unfolding of definite objects of thought.' Many of Auerbach's works, which in German nearly 40 volumes, have been translated, not only well, into English. After a restless life, passed at Frankfort, Vienna, Dresden, Berlin, &c., he died at Cannes, 8th February 1882. See *Berthold Auerbach, ein Gedenkblatt* (1882), and two volumes of his Correspondence (1884).

Auersperg, ANTON ALEXANDER, GRAF von, German poet, was born at Laibach, April 11, 1800. Descended from an ancient Swabian family which in the 11th century, had settled and acquired large estates in Carniola, he took a prominent position in the diet of that province (1861-67). In 1861 he was chosen a life-member of the upper house of the Austrian Reichsrath; and he died at Gratz, 12th September 1876. He was always distinguished by his Liberalism and his ultra-German sympathies; but he is best known under the *nom de plume* of Anastasius Grün, as one of the German epic and lyrical poets, among whom he holds a high rank, excelling most in humorous subjects and political satires. His collected works fill 7 vols. (1877). See the Life of him by Radicz (2 vols. 1876-78).

Auerstädt, a village in the Prussian province of Saxony, 10 miles W. of Naumburg. It is famous for the great battle which took place there, October 14, 1806, between the French under Davoust, and the Prussian army under the Duke of Brunswick, which ended in a great victory for the former. The Prussians, who numbered fully 48,000, left nearly half their men dead or wounded, on the ground, while the French (30,000) escaped with a loss of only 7,000. Napoleon, who had, on the same day, defeated the main army of Frederick-William III. at Jena (q.v.), made Davoust Duke of Auerstädt.

Aufrecht, THEODOR, philologist, born 2d January 1822 at Leschnitz in Upper Silesia. After studying at Berlin under Bopp, Bekker, and Lachmann, he settled there in 1850, and devoted himself to Sanskrit and the old German tongues. To this time of his life also belong

his collaboration with Kirchhoff in the publication of *Umbrische Sprachdenkmäler* (2 vols. Berlin, 1849-51), an epoch-making work in the comparative study of the languages of ancient Italy; as well as the founding of the well-known *Zeitschrift für vergleichende Sprachforschung* (1852), in the editing of which he assisted A. Kuhn for some time. In 1852 he repaired to Oxford, where he helped Max Müller in his edition of the *Rigveda*, and was appointed to a place in the Bodleian Library, the fruit of which was his excellent *Catalogus codicum Sanscritorum bibliothecæ Bodleianæ Ozoniensis* (1864). In 1862 he became professor of Sanskrit and Comparative Philology at Edinburgh, and in 1875 resigned this chair for one at Bonn. Aufrecht has published scholarly editions of several classical Sanskrit works, most important being his *Rigveda*, in the Roman character (2d ed. 2 vols. Bonn, 1877).

Auge'as, or **AUGEIAS**, son of Phorbas or of Helios (the sun), king of the Epeans in Elis. He had 3000 head of oxen in his stables, which had not been cleaned out for thirty years. Hercules was commissioned by Eurystheus to cleanse the Augean stables in one day, and was promised as payment a tenth part of the oxen. He accomplished the task by turning the courses of the rivers Peneus and Alpheus through the stables. Augeas now refused to pay the stipulated wages, whereupon Hercules killed him.

Augereau, **PIERRE FRANÇOIS CHARLES**, Duke of Castiglione, marshal and peer of France, one of the most brilliant and intrepid of that band of general officers whom Napoleon gathered around himself, was the son of a Paris fruiterer, and was born in 1757. After serving in the French and Neapolitan armies, he settled in Naples as a fencing-master in 1787. In 1792 he volunteered into the French revolutionary army, and in less than three years was made a general of division. In 1795 he accompanied the army to Italy, where he greatly distinguished himself, gaining glory in the battles of Lodi, Castiglione (in 1796, from which he afterwards received his title), and Roveredo. At Paris, in 1797, he carried through the *coup d'état* of the 4th September, and he soon became a supporter of Napoleon. In 1801 he received the command of the army in Holland. In 1804 he was made a marshal; commanded a wing at Jena and at Eylau; was governor at Berlin, and fought at Leipzig in 1813. He sat in the chamber of peers after the restoration, and died in 1816.

Augier, **GUILLAUME VICTOR ÉMILE**, a French dramatist, was born at Valence, September 17, 1820, and was educated as a lawyer. In 1844 he composed a drama in verse, *La Ciguë*, which was played at the Odéon with success. Other dramas in verse are *Gabrielle* (1849), *Diane* (1852), *La Jeunesse* (1858), and *Paul Forestier* (1868). Originally criticised as a leader of the 'school of good sense,' he ultimately dealt unsparingly with the vicious tendencies of modern life, though never forsaking the idealist standpoint. His later dramas are mostly in prose, and may be said to belong to the comedy of intrigue. Notable works are *Le Mariage d'Olympe* (1855); *Le Gendre de M. Poirier* (1854), written in partnership with Jules Sandeau; *Les Lionnes Pauvres* (1858); *Les Effrontés* (1861); *Le Fils de Giboyer* (1862); *Maître Guérin* (1869); and *Les Fourchambault* (1874), his masterpiece. In a number of his works he was a collaborateur with other dramatists. In 1858 he became a member of the Academy, and in 1868 Commander of the Legion of Honour. He died 28th October 1889. His *Théâtre complet* fills 4 vols. (1876-77).

Augite (Gr. *augē*, 'brilliance'), one of the Pyroxene (Gr. *pyr*, 'fire,' and *xenos*, 'a guest')

group of minerals, is very nearly allied to Hornblende (q.v.). Augite consists of 47-56 per cent. of silica, 20-25 per cent. of lime, and 12-19 per cent. of magnesia, the magnesia sometimes giving place in whole or in part to protoxide of iron, and some varieties containing a little alumina, or a little protoxide of manganese. Its specific gravity is 3.195-3.525. It is little affected by acids, or not at all. It is usually of a greenish colour, often nearly black. It crystallises in six or eight-sided

a, Common Augite; b, Green Augite.

prisms variously modified. It is an essential component of several igneous rocks, particularly of Basalt (q.v.) and its varieties, and it occurs as an accessory constituent in a great many more. It is in fact as a rock-constituent that augite derives its importance as a mineral species. Augite rock, consisting essentially of augite alone, occurs in the Pyrenees. It is rarely associated with quartz, in which respect it differs from hornblende, but very often with labradorite, olivine, nepheline, and leucite. Fluorine, which is generally present in small quantity in hornblende, has never been detected in augite. The form of the crystals is also different in the two minerals, as well as their cleavage. In augite, the cleavage-planes intersect nearly at right angles; in hornblende, the angles are 124° 30' and 55° 30'. Rose of Berlin endeavoured to show that the difference between augite and hornblende arises only from the different circumstances in which crystallisation has taken place, and that augite is the production of a comparatively rapid, and hornblende of a comparatively slow cooling. His views have been supported by experiments, and by a comparison of augite with certain crystalline substances occurring among the scoriae of foundries.—*Diopside*, *Sahlite*, and *Coccolite* are varieties of augite.—*Drallage* (q.v.) and *Hypersthene* (q.v.) are very nearly allied to it.

Augmentation, in Heraldry, an additional charge in a coat-of-arms bestowed by the sovereign as a mark of honour. Augmentations have generally been granted to be borne on a canton, on an escutcheon *en surtout*, or on a chief. The bearings on the chiefs of augmentation bestowed on the military and naval heroes of England in the beginning of the present century, are for the most part so confused and unarmorial, that an intelligible description of them can scarcely be given in heraldic language.

Augmentation, in Music, is the reproduction of a melody, or principal subject of a composition, in the course of the progress of the piece, in notes of greater length than those notes in which the melody is first introduced. The tempo remains unaltered. Augmentation is of great importance in the treatment of the subjects, or themes, for fugues, and when cleverly used, produces great effects.

Augmentation, **PROCESS OF**, in Scots law, an action in the Court of Teinds (q.v.) by the minister of a parish against the titular or person entitled to the free teinds, the patron, or the landowners, for the purpose of procuring an increase to his stipend.

The moderator and clerk of the presbytery to which the minister belongs must also be called as parties. A period of twenty years must elapse before the minister becomes entitled to a fresh augmentation. There must of course be some free teind in the parish—i.e. teind not previously applied to stipend, otherwise there can be no augmentation. In many parishes the teinds are exhausted. The amount of the augmentation is fixed, or modified, as it is termed, in so many chalders of grain or victual, generally Linlithgow measure of oatmeal and barley: the stipend itself being paid in money, according to the Fairs Prices (q.v.) of each year. In the modification of a suitable stipend, regard is had to the state of the teinds, the extent of the parish, the population to be cared for, the expense of living, and the like; but a general cause, such as the Repeal of the Corn Laws, was not held to justify an augmentation. It is usual to give three or four chalders. This process has the further object in view of *localling* the stipend so modified—i.e. of assigning it in due proportions to the heritors or other parties in possession of the teinds. This object is attained by means of what is called a scheme of locality—an allotment of the stipend modified to the several parties liable therefor. This scheme is prepared at the instance of the second junior Lord Ordinary (q.v.), on a remit from the Teind Court. The last conclusion in a summons of augmentation is for a suitable sum, or increase to the sum already allowed, for communion elements—i.e. for bread, wine, and other necessities for celebrating the sacrament of the Lord's Supper after the Presbyterian fashion. In the case of large town parishes, as much as £30 has been given to each of the collegiate ministers. When there is not sufficient teind to bring the stipend up to £150 per annum, with £8, 6s. 8d. for communion elements, it is provided that the deficiency shall be paid by the Exchequer. Much discontent is felt with the tedious and expensive nature of augmentations, especially where in an urban parish the stipend has to be allocated over a great number of small rentals. Litigation frequently occurs as to the rights held to teinds, and the validity of the valuations of teinds made early in the 17th century. Questions between overpaying and underpaying heritors are also kept open for long periods of time. An attempt has recently been made to simplify augmentations, but the measure was not approved of by the dissenting communities.

AUGMENTATION OF BENEFICES is an important form of church extension in England. Much of the Queen Anne's Bounty is applied to this purpose, and under the Lord Chancellor's Act of 1863 nearly a quarter of a million sterling, realised by the sale of certain classes of adwoson, has been similarly applied. See **STIPEND**, **GLEBE**, **MANSE**; also **PARLIAMENTARY CHURCH**.

Augsburg, an historic city of Bavaria, capital of the province of Swabia, is situated in the angle between the rivers Wertach and Lech, 37 miles WNW. of Munich. Though presenting an antique and rather deserted appearance, Augsburg has numerous fine buildings, and one noble street, the Maximilian Strasse, adorned with three bronze fountains (1593-1602). The principal edifices are the Renaissance town-house (1620), with its splendid 'Golden Hall'; the Perlach Tower, dating from the 11th century; the former episcopal palace, where, on 25th June 1530, the Protestant princes presented the Augsburg Confession to Charles V.; the grand old mansion of the Fuggers; the 'Three Moors,' one of the most interesting hostels in Germany; and the Gothicised Romanesque cathedral (994-1421), with its bronze doors and early glass-paintings. The industry of Augsburg is once more vigorous.

Cotton is now the staple manufacture; and there are also large factories for woollens, paper, tobacco, and machinery. The gold and silver wares retain their ancient reputation; and printing, lithography, and bookselling have taken a new start, though the *Allgemeine Zeitung* (1798), the best known of the German newspapers, was in 1882 transferred to Munich. There are in Augsburg a dozen printing establishments, thrice that number of bookshops, and more than 70 breweries. Banking and stock-jobbing are extensively carried on; and Augsburg is still the emporium of the trade with Italy and Southern Germany, being the centre of a system of railways that connect it with Nuremberg, Leipzig, Switzerland, Munich, &c. Pop. (1871) 51,270; (1885) 65,476; of whom 66 per cent. were Catholics.

The foundation of Augsburg was the 'colony' planted by the Emperor Augustus, 12 B.C., after the conquest of the Vindelici, probably on the site of a former city of that people. It was called *Augusta Vindelicorum*, and hence the present name. It became the capital of the province of Rætia, was laid waste by the Huns in the 5th century, and came next under the dominion of the Frankish kings. In the war of Charlemagne with Thassilo of Bavaria, it was again destroyed (788). After the division of Charlemagne's empire, it came under the Duke of Swabia; but having become already rich by commerce, was able to purchase gradually many privileges, and finally became in 1276 a free city of the empire. It now rose to greater consequence than ever, and had reached the summit of its prosperity by the latter half of the 14th century. In 1368 its aristocratic government was set aside for a democratic, which lasted till 1548, when the aristocracy, favoured by Charles V., regained the ascendancy. Augsburg continued in great eminence for its commerce, manufactures, and art, till the war between Charles V. and the Protestant league of Schmalkald (1540). Along with Nuremberg it formed the emporium of the trade between Northern Europe and the south, and its merchants were princes whose ships were in all seas (see **FUGGER**). It was also the centre of German art as represented by the Holbeins, Burgkmair, Altdorfer, and others. Many diets of the empire were held in Augsburg, and the leading events of the Reformation are associated with its name, as the Diet of Augsburg (1530), the Interim of Augsburg (1548), and the 'Religious Peace' of Augsburg (1555) by which the Protestants secured the full enjoyment of their rights and privileges (see **REFORMATION**). The discovery of the road to India by the Cape, and of America, turned the commerce of the world into new channels, and dried up the sources of Augsburg's prosperity. It ceased to be a free city on the abolition of the German empire in 1806, and was taken possession of by Bavaria.

Augsburg Confession, the chief standard of faith in the Lutheran Church. With a view to an amicable arrangement of the religious split that had existed in Germany since 1517, Charles V., as protector of the church, had convoked a diet of the empire, to meet at Augsburg, 8th April 1530, and had required from the Protestants a short statement of the doctrines in which they departed from the Catholic Church. In March, therefore, the Elector, John of Saxony, called on his Wittenberg theologians, with Luther at their head, to draw up articles of faith, to lay before him at Torgau. The commissioned doctors took as a basis, in so far as pure doctrine was concerned, articles that had been agreed to the previous year at conferences held at Marburg and Schwabach, in the form of resolutions of the Lutheran reformers of Germany against the doctrines of Zwingli. These doctrinal articles, supplemented, and with a practical part newly added, were laid before the

Elector at Torgau. Melancthon then, taking as a foundation the Torgau articles, began at Augsburg in May, and, with the advice of various Protestant theologians, as well as princes and other secular authorities, composed the document which he first called an Apology, but which in the diet itself took the name of the Augsburg Confession. Luther was not present in Augsburg, being then under the ban of the empire, but his advice was had recourse to in its composition. The Torgau articles were in German; the Confession was both in German and Latin; and Melancthon laboured incessantly at its improvement till it was presented to the emperor, June 25. In composing the document, Melancthon sought to maintain a spirit of forbearance and conciliation, as well as to secure the utmost brevity and simplicity. The aim of the Confession was to give a collected view of the belief of the Lutheran Protestants, to lay a foundation for measures of reconciliation. The Protestant doctrines were stated in a form as near that of the Catholic views as possible, and their agreement with the church fathers carefully emphasised.

The first part of the Confession contains twenty-one articles of faith and doctrine: 1. Of God; 2. Of Original Sin; 3. Of the Son of God; 4. Of Justification; 5. Of Preaching; 6. Of New Obedience; 7 and 8. Of the Church; 9. Of Baptism; 10. Of the Lord's Supper; 11. Of Confession; 12. Of Penance; 13. Of the Use of Sacraments; 14. Of Church Government; 15. Of Church Order; 16. Of Secular Government; 17. Of Christ's Second Coming to Judgment; 18. Of Free Will; 19. Of the Cause of Sin; 20. Of Faith and Good Works; 21. Of the Worship of Saints. The second and more practical part, which is carried out at greater length, contains seven articles on disputed points: 22. On the Sacrament in Two Kinds; 23. Of the Marriage of Priests; 24. Of the Mass; 25. Of Confession; 26. Of Distinctions of Meat; 27. Of Conventual Vows; 28. Of the Authority of Bishops.

This document, signed by seven Protestant princes and two free cities, was read before the emperor and the diet, 25th June 1530. Melancthon, not looking upon the Confession as binding, began shortly after to make some alterations in its expression; at last, in 1540, he published a Latin edition (*Confessio Variata*) in which there were important changes and additions. This was especially the case with the article on the Lord's Supper, in which, with a view to conciliation, he endeavoured to unite the views of the Lutherans and Calvinists. This gave rise subsequently to much controversy; orthodox Lutheranism repudiated the alterations of Melancthon, and long continued to subject his memory to great abuse; though it is clear that Melancthon and his adherents contemplated no substantial departure in doctrine from the original Confession. It is not certain that the form of the Confession found in the Lutheran standards is identical with the unaltered Augsburg Confession, as the two original documents—German and Latin—laid before the diet have been lost. The chief distinction between the orthodox Lutherans and the reformed churches of Germany has all along been adherence to the 'unaltered' or to the 'altered' Confession. It was even a matter of controversy whether the 'reformed' were entitled to the rights secured to the Protestants by the Religious Peace of Augsburg, concluded in 1555, on the ground of the 'unaltered' Confession.—Though the Augsburg Confession is still formally adhered to by the Protestant churches of Germany, it is confessedly no longer the expression of the belief of the vast majority of the members, after the great advances made by theology, and the many alterations in public opinion and feeling.

Augsburg Interim. See INTERIM.

Auguries and Auspices, the observation and interpretation of omens as a means of obtaining knowledge of secret or future things. The general doctrine of the interpretation of divine revelation is called *Divination* (q.v.), and this more general term includes both *artificial* divination by prodigies, lightning, astrology, lots, observation of the flight or feeding of birds, and the appearance of the entrails of animals or haruspication, as well as *natural* divination through dreams and prophetic oracles. There was no natural divination among the Romans—they had not conceived, like the Greeks, that notion of inward inspiration and insight, by which a human soul is enlightened by a fateful intuition and made to participate for an instant in the divine omniscience. The supernatural faculty is confined to the gods themselves, and they speak directly to men through the passive organs of animals. From the very dawn of Roman history divination is a kind of political institution. It does not develop the curiosity of the mystic; it reduces revelation to nothing more than simply information on the actual dispositions of the gods, only touching indirectly the past and the future. It only asks one problem—to know if the gods encourage or not the design about which they are consulted; it awaits the reply from Jupiter himself, and forbids the inquiry to be made otherwise than through certain conventional signs. The augural art does not go further than this. If in certain grave conjunctions it was found insufficient, the Romans preferred to consult the Etruscan *haruspices* or the Hellenic oracles rather than to add anything to their traditional customs.

The two Latin words *augur* (*avis*, 'a bird,' and a root allied to Sanskrit root *gar*, 'to call') and *auspex* (for *avispex*, from *avis*, 'a bird,' and *spicio*, 'I see') differed originally as a general idea from a particular one, since the latter observed only the flight of birds. Yet as this latter kind of augury was the most common, the two words are frequently interchanged or employed in connection. Neither vaticination or direct revelation, nor the interpretation of fortuitous presages, was so much esteemed by the Romans as the observation of birds. It was the function of the augurs to make these observations and explain their significance. It was not, however, any one who could be appointed an augur. The gods selected their own interpreters—that is to say, they conferred the divine gift upon them from their very birth; but an educational discipline was also considered necessary, and hence a 'college of augurs' figures in the very dawn of Roman history. Romulus himself is represented in legend as an augur. Previous to the Ogulnian law, passed in the year 307 B.C., there were only four augurs, who were selected from the patricians. By this law, however, the plebeians became eligible for the pontifical or augural offices, and five were immediately created. For more than two hundred years the number continued the same, till Sulla in 81 B.C. increased it to fifteen. Finally, in the first days of the Empire, when all parties, sick of the long civil wars, hurried to throw their privileges at the feet of the monarch who had brought peace into their homes, the right of electing augurs at his pleasure was conferred on Augustus, after which the number became indefinite.

At first, the augurs were elected by the *Comitia Curiata*; but as the sanction of the former was necessary to give validity to the acts of the latter, they could always veto any elections which were obnoxious to them; so that the power of electing members to fill up vacancies naturally fell into the hands of the college itself, and so continued till 103 B.C., when a tribune of the people named Ahenobarbus carried a law by which it was enacted that

for the future, vacancies in the augural and pontifical offices should not be filled up by those religious corporations themselves, but by a majority of certain selected tribes. This new law was occasionally repealed and re-enacted during the civil wars which lasted till the time of Augustus. The scramble for power, however, during these political vicissitudes, as well as the general advance of knowledge, had rendered the prophetic pretensions of the augur's office ridiculous in the eyes of educated people. By Cicero's time it had lost its religious character altogether, but was still regarded as one of the highest political dignities, and coveted for the power it conferred.

The modes of divination employed by the augurs were five in number—*augurium ex celo, ex avibus, ex tripudiis, ex quadrupedibus, ex diris*. The first related to the interpretation of the celestial phenomena, such as thunder and lightning, was apparently of Etruscan origin, and was held to be of supreme significance. The second related to the interpretation of the noise and flight of birds. It was not every bird, however, that could be a sure messenger of the gods. Generally speaking, those 'consulted' were the eagle, vulture, crow, raven, owl, and hen. The first two belonged to the class of *alites*, or birds whose flight revealed the will of the gods; the last four to the class of *oscines*, whose voice divulged the same. These two modes of augury were the oldest and most important. Of the other three, the auguries *ex tripudiis* were taken from the feeding of chickens; the auguries *ex quadrupedibus*, from four-footed animals—as, for instance, if a dog, or wolf, or hare ran across the path of a Roman, and startled him by any unusual motion, he mentioned it to an augur, who was expected to be able to advise him what to do; the auguries *ex diris* (a vague kind of augury), from any trifling accidents or occurrences not included in the previous four—such as sneezing, stumbling, spilling salt on the table, and the like.

At Rome, the auspices were taken on the summit of the Capitoline Hill; and the ground on which the augur stood was first solemnly set apart for the purpose. He next took a wand, and marked out a portion of the heavens in which his observations were to be made. This imaginary portion was called a *templum* (hence *contemplari*, 'to contemplate'), and was subdivided into right and left. According as the birds appeared in either of these divisions were the auspices favourable or unfavourable. How vast the political influence and authority of the augurs must have been is seen from the fact that almost nothing of any consequence could take place without their sanction and approval. The election of every important ruler, king, consul, dictator, or prætor, every civic officer, every religious functionary, was invalid, if the auspices were unfavourable. No general could lawfully engage in battle—no public land could be allotted—no marriage or adoption, at least among the patricians, was held valid—unless the auspices were first taken, while the *Comitia* of the Centuries could be dispersed at a moment's notice by the veto of any member of the augural college.

Not the augurs alone, but the chief magistrates of Rome (inheriting the honour from Romulus), held the 'auspices,' while the 'auguries' were exclusively in the possession of the former. The power of taking the auspices in war was confined to the commander-in-chief; and any victory gained by a legate was said to be won under the auspices of his superior, and the latter alone was entitled to a triumph. Hence has originated the very common phrase in our language, 'under the auspices' of some one, which usually denotes nothing more than that the person alluded to merely lends the influence of his name.

It must not be supposed that it was among the Romans alone that augury was practised. It is well known in the folklore of every race, and there are few English peasants to whom the magpie and cuckoo are not still significant. Dr Tylor quotes in his *Primitive Culture* many instances which show that it has always been and is still part of the doctrine of the savage in whatever quarter of the globe he is found. It is familiar to the Tupis of Brazil and the Dyaks of Borneo. The Maoris think it unlucky if an owl hoots during a consultation, but are encouraged if a hawk flies overhead; a flight of birds to the right of the war-sacrifice is propitious if the villages of the tribe are in that quarter, but if the omen is in the enemies' direction the war will be given up. The Kalmuck is happy when a white owl flies by on the right, but expects calamity when he sees one on the left; and to the negro of Old Calabar the direction in which he hears the cry of the great kingfisher has exactly the same significance. Haruspication also is practised by the Malays and Polynesians and by various Asiatic tribes. It is mentioned as practised in Peru under the Incas, and Sir Richard Burton's account of it in Central Africa is in all respects similar to its usage among the civilised Romans. See the great work of Bouché-Leclercq, *Histoire de la Divination dans l'Antiquité* (4 vols. 1880-82).

August, the sixth month in the Roman year, which began with March, was originally styled *Sextilis*, and received its present name in honour of the Emperor Augustus, several of the most fortunate events of his life having occurred during this month. In this month he was first admitted to the consulate, and thrice entered the city in triumph. In the same month, the legions from the Janiculum placed themselves under his auspices, Egypt was brought under the authority of the Roman people, and an end put to the civil wars. To make it equal with the fifth month, whose name had been changed from *Quintilis* to *Julius* in honour of Julius Cæsar, a day was taken from February and added to August.

Augusta, or AGOSTA, a fortified city of Sicily, 11 miles N. of Syracuse by rail. It stands on a rocky islet joined by a bridge to a peninsula projecting into the Mediterranean, and is near the site of the *Megara Hyblæa* of the ancients. The port is spacious, but of rather difficult access. Salt, oil, wine, cheese, fruit, honey, and sardines are exported. Pop. (1881) 12,210. The town often suffered during the wars of the middle ages, and was in great part destroyed by earthquakes in 1693 and in 1848. Near it was fought in 1676 a great naval battle between the French under Duquesne, and a Spanish and Dutch fleet under the famous admiral De Ruyter. The latter was defeated, and received a wound of which he died at Syracuse.

Augusta, the capital of Maine, U.S., on the Kennebec, 63 miles NNE. of Portland by rail. It stands at the head of regular navigation, but small steamers run 18 miles higher. A dam, 17 feet high, affords considerable water-power, which is rendered available by a canal along the west bank, on which side the city is principally built. There are several cotton and other mills, and in 1886 a new system of waterworks was introduced. Besides the state-house and other administrative buildings, Augusta contains a U.S. arsenal; and at Togus, 4 miles distant, is situated one of the national institutions for disabled soldiers, with accommodation for 1350 persons. Pop. (1880) 8665; (1890) 10,527.

Augusta, the third city of Georgia, U.S., is situated on the Savannah River, 231 miles from its mouth, but only 132 miles from Savannah by rail. It is the head of steamboat navigation on the river, which is here spanned by three bridges,

connecting the town with Hamburg, S.C., and which is crossed by a stone dam, 1720 feet in length, from which a canal, 8 miles long and 150 feet wide, supplies water both for domestic use and for the mills. These latter are numerous, about \$4,000,000 being invested in cotton factories, and \$3,000,000 in other manufacturing enterprises. Augusta is the seat of the Medical College of Georgia (1832), and contains several other handsome public buildings, the city being generally well and regularly built. Pop. (1860) 12,493; (1890) 21,891; (1890) 33,300.

Augustenburg, a village of 600 inhabitants on a bay of the island of Alsen (q.v.). Its castle (1776) was formerly the residence of the Dukes of Holstein-Sonderburg-Augustenburg.

Augusti, JOHANN CHRISTIAN WILHELM, a learned German theologian, born in 1772 near Gotha. He studied at Jena, and successively filled there the chairs of Philosophy and of Oriental Languages. But in 1812 he accepted a theological professorship in Breslau, and in 1819 one at Bonn. He died in 1841. In the early part of his career, Augusti was a decided rationalist; but subsequently he returned to orthodox Lutheranism. His writings, marked by great learning, industry, and spirit, comprise works in the history of Christian dogma and an introduction to the Old Testament; but the most valuable is his manual of Christian Archæology (Leip. 3 vols. 1836-37).

Augustine, ST (AURELIUS AUGUSTINUS), the greatest of the Latin fathers, was born at Tagaste, a town of Numidia, on the 13th of November 354 A.D. His father, Patricius, was poor, but of good family, and filled the office of magistrate. He continued a pagan till advanced in years, and was only baptised shortly before his death. He does not seem to have been remarkable for any elevation of mind; on the contrary, one may fairly conclude, from his son's statements, that he was an irascible, kind-hearted man, more intent on his son's advancement in this world than in that which is to come. Patricius was very anxious that Augustine should become a fine scholar, as he noticed that not a few people in his day were obtaining large incomes by their 'wits.' Augustine was accordingly sent to school at Madaura, and subsequently to Carthage, to complete his studies. Previous to this, however, he had enjoyed the inestimable felicity of a religious education at home. His godly mother, Monica, had been his best instructor. Neander truly says: 'Whatever treasures of virtue and worth the life of faith, even of a soul not trained by scientific culture, can bestow, were set before him in the example of his pious mother.'

The energy and penetration of intellect exhibited by the young Augustine excited the most flattering hopes. When he left home for Carthage, a joyous, ardent, and resolute student, a bright career of worldly prosperity seemed to open before him. But strong as Augustine was, the temptations of Carthage were stronger. His nature, deep, impetuous, and passionate, thirsted for excitement. He had just reached the age when pleasure is conceived to be synonymous with happiness, and Carthage, the second city of the empire, was rank as Rome in its sensual corruptions. Augustine fell. In his *Confessions* he paints the frightful abyss into which he felt himself plunged; nor does he seek to excuse himself; on the contrary, the shadow of his guilt is thrown forward over all his boyish life, and he displays even a morbid zeal and acuteness in pointing out what others, less censorious, might term the frivolous errors of his childhood, but which seemed to Augustine the parents of his subsequent vices, and therefore equally bad and equally reprehensible. Before he had reached

his eighteenth year, his mistress bore him a son, who was named Adeodatus—afterwards baptised along with him at Milan. The thing which appears to have first stirred his deeper being into life was a passage which he suddenly came across in the *Hortensius* of Cicero, treating of the worth and dignity of philosophy. Fascinated by 'the delusive pretensions of the Manichæan sect, which, instead of a blind belief on authority held out the promise of clear knowledge and a satisfactory solution of all questions relating to things human and divine,' Augustine now became a professed Manichæan. Returning to his native town, he lectured for a short time on 'grammar'—that is to say, on literature. Soon afterwards, he returned to Carthage, to pursue his profession under more favourable auspices. Here he wrote, in his twenty-seventh year, his first work, *De Apto et Pulchro*—a treatise on æsthetics, which has unfortunately been lost. About the same time his spiritual nature became keener and more imperative in its demands. The futile speculations of the visionary sect to which he had attached himself now became apparent. He had a series of interviews and conversations with Faustus, one of the most celebrated teachers of Manichæism; and these so utterly disappointed his expectations, that he left the society in disgust and sad bewilderment, after having wasted ten years in a fruitless search for wisdom and truth.

In 383 he went to Rome, followed by the tears, the prayers, and the anxieties of his excellent mother, who was not, however, bereaved of hope, for both her faith and her love were strong. After a short stay, Augustine left Rome, and proceeded to Milan, where he became a teacher of rhetoric. No change could have been more fortunate. At this time the Bishop of Milan was the eloquent and devout St Ambrose. An intimacy sprang up between the two, and Augustine, who was at this time a zealous student of Plato, often went to hear his friend preach. He confesses that the Platonic writings 'enkindled in his mind an incredible ardour;' they awakened his deeper spiritual nature, which keenly upbraided him with his sins. Once more he studied the Bible, wishing to find in it 'those truths which he had already made himself acquainted with from the Platonic philosophy, but presented in a different form.' He began to think that Christ and Paul, by their glorious life and death, their divine morality, their great holiness, and manifold virtues, must have enjoyed much of that 'highest wisdom' which the philosophers thought confined to themselves. For some time he clung to his Platonic Christianity, and shaped the doctrines of the Bible according to it; but when he found that it was weak to overcome temptations, and that 'he himself was continually borne down by the ungodly impulses which he thought he had already subdued,' the necessity of a living personal God and Saviour to rescue him from the condemnation of his own conscience, and impart a sanctifying vitality to the abstract truths which he worshipped, shone clear through all the stormy struggles of his heart. In the eighth and ninth books of his *Confessions* he has left a noble though painful picture of his inward life during this momentous crisis. It is sufficient to say that the Spirit of God triumphed. On the 25th of April 387 A.D., Augustine, along with his natural son Adeodatus, was baptised by Ambrose at Milan. Shortly after, he set out on his return home. At Ostia, on the Tiber, his beloved mother, who had followed him to Milan, died; her eyes had seen the salvation of her son, and she could depart in peace. After her death, and before leaving Italy for Africa, Augustine wrote his treatises, *De Moribus*

Ecclesiæ Catholicæ et de Moribus Manichæorum; *De Quantitate Animæ*; and *De Libero Arbitrio*. His character and principles of action had become fixed, and he now brought the whole majesty of his intellect to bear upon the side of Christianity. Having, as was then customary for converts, divided his goods among the poor, he retired into private life, and composed several treatises—*De Genesi contra Manichæos*, *De Musica*, *De Magistro*, and *De Verâ Religione*, which secured him a high reputation. In 391 he was ordained a priest by Valerius, Bishop of Hippo in Numidia; and during the next four years, though earnestly engaged in the work of preaching, contrived to write three different works. In 395 he was made colleague of Valerius. Then ensued a period of hot strife, known in church history as the Donatist and Pelagian controversies. Augustine, as may naturally be supposed, having passed through so fierce a fire of personal experience on religious questions, would be very jealous both of what he *knew* to be the truth, and of what he only *thought* to be the truth. This, added to his acute and profound intellect, made him, in spite of the poverty of his historical erudition, a most formidable and relentless antagonist. But this portion of his career will fall to be treated more properly under PELAGIUS and DONATISTS (q.v.). In 397 appeared his *Confessiones*, in 13 books. It is a deep, earnest, and sacred autobiography of one of the greatest intellects the world has seen. Passages of it have no parallel except in the Psalms of David. In 413 he commenced his *De Civitate Dei*, and finished it in 426. It is generally considered his most powerful work. Intended to be a great vindication of the Christian church, conceived of as a new order rising on the ruins of the old Roman empire, it is not only the grandest and most philosophical of the earlier monuments of Christian theology, but one of the most profound and lasting monuments of human genius. Yet exception may be taken to much that it contains. The learning is no doubt very considerable, but it is not accurate. Augustine was an indifferent scholar; he had studied the Latin authors well; but of Greek 'he knew little, and of Hebrew, nothing,' consequently many of his reasonings are based on false and untenable premises, and he errs often in his etymological explanations. In 428 Augustine published his *Retractationes*, in which he makes a recension of all his previous writings. It is a work of great candour. He frankly acknowledges such errors and mistakes as he had discovered himself to have committed, explains and modifies numerous statements, and modestly reviews his whole opinions. His end was now drawing nigh. In 429 the Vandals, under the barbarian Genseric, landed in Africa; next year they besieged Hippo. Augustine, now in his seventy-sixth year, prayed that God would help his unhappy church, and grant himself a release out of this present evil world. He died on the 28th of August 430, in the third month of the siege.

No mind has exerted greater influence on the church than that of Augustine. 'No controversy of his age was settled without his voice, and in his Letters (which fill a whole volume of the Benedictine edition of his works) we see the vastness of his empire, the variety of subjects on which appeal was made to him, and the deference with which his judgment was received.' Consistency of theological opinion is not to be looked for from him, nor from any of the church fathers. A larger sphere of freedom was permitted to religious speculation in those unfettered days, before creeds were encircled with that traditional sanctity they now possess. Nevertheless, we have little difficulty in determining the central

tenets of his theological belief. He held the corruption of human nature through the fall of man, and the consequent slavery of the human will. Both on metaphysical and religious grounds, he asserted the doctrine of predestination, from which he necessarily deduced the corollary doctrines of election and reprobation; and finally, he strenuously supported, against the Pelagians, not only these opinions, but also the doctrine of the perseverance of the saints. At the same time, it is but fair to add that, even on such points, his language is far from uniform; that much of the severity of his doctrines arose from the bitter and painful remembrance of his own early sins, and from the profound impression which the corrupt state of society in his time, and the vast desolations of barbarism, had made on his earnest and susceptible soul; and that, in his desire to give glory to God, he sometimes forgot to be just to man. In illustration of this may be mentioned the fact that the maxim which justified the chastisement of religious errors by civil penalties, even to burning, was established and confirmed by the authority of Augustine, and thus transmitted to succeeding ages. In his epistle to Dulcitius, a civil magistrate who shrank from putting in force the edict of Honorius against heretics, he uses these words: 'It is much better that some should perish by their own fires, than that the whole body should burn in the everlasting flames of Gehenna, through the desert of their impious dissension.' In the opinion of Neander, it was to the somewhat narrow culture, and the peculiar personal experience and temperament of Augustine, that the doctrines of absolute predestination and irresistible grace, first systematised by him, owed much of that harshness and one-sidedness which so long obstructed their general reception by the church, and which continue to render them repulsive to multitudes. It was not, however, by his controversial writings merely, but by his profound conception of Christianity and the religious life, and by his personal fervour and force of character that Augustine moulded the spirit of the Christian church for centuries. The church regarded him as the greatest of the fathers, and at the Reformation Protestants and Catholics alike appealed to his authority. Calvinism is by many regarded as little more than a reassertion of Augustinianism, though this is denied by the Catholic Church; and Jansenism was held by its supporters as the only real expression of Augustine's views. See articles CALVIN, JANSEN, ELECTION, HELL, PREDESTINATION, WILL.

The best complete edition of his works is that of the Benedictines, published at Paris in 8 vols. (11 parts) folio (1679-1700; reprinted in 22 half-vols. 1836-40). They occupy 16 vols. (32-47) of Migne's *Patrologia Latina*. Numerous editions of the *Confessiones* and *De Civitate Dei* have appeared. A complete English translation of his works was published at Edinburgh in 15 vols. (1872-80) under the general editorship of Dr Marcus Dods, the *City of God* being by the editor, the *Confessions* by the Rev. J. G. Pilkington, the *Letters* by the Rev. J. G. Cunningham.

Cunningham, *St Austin and his Place in the History of Christian Thought*, the Hulsean Lecture for 1885.

Augustine, or AUSTIN, ST, first Archbishop of Canterbury, was prior of the Benedictine monastery

of St Andrew at Rome, when, in 596, he was sent, with forty other monks, by Pope Gregory I., to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman see in Britain. Landing in Thanet, the missionaries were kindly received by Ethelbert, king of Kent, whose wife Bertha, daughter of the Frankish king, was a Christian, and retained a bishop in her suite as chaplain. A residence was assigned to them at Canterbury, where they devoted themselves to monastic exercises and preaching. The conversion and baptism of the king contributed greatly to the success of their efforts among his subjects, and it is recorded that in one day Augustine baptised 10,000 persons in the river Swale. Nominal as much of this conversion must have been, there is abundant testimony to the fact that a marked improvement in the life and manners of the Anglo-Saxons followed the evangelistic labours of Augustine and his companions. In 597 he went to Arles, and there was consecrated Bishop of the English. On his return, he despatched a presbyter and monk to Rome, to inform the pope of his success, and obtain instruction on certain questions. Gregory's counsels with regard to the propagation of the faith are admirable examples of that pious ingenuity which has often characterised the missionary policy of the Church of Rome. Thus, instead of destroying the heathen temples, Augustine was recommended to convert them into Christian churches, by washing the walls with holy water, erecting altars, and substituting holy relics and symbols for the images of the heathen gods. Augustine's subsequent efforts to extend his authority over the native British church, with whose bishops he held a conference in 603 at Aust on the Severn, were not so successful as his missionary labours. He died 26th May 604, and eight years afterwards his body was translated to his abbey of SS. Peter and Paul, whose site is now occupied by St Augustine's Missionary College, Canterbury (1848).

Augustinians, the name given to several religious bodies in the Roman Catholic Church. Whether St Augustine ever framed any formal rule of monastic life, is uncertain; but one was deduced from his writings, and was adopted by as many as thirty monastic fraternities, of which the chief were the Canons Regular of St Augustine, the Begging Hermits or Austin Friars, the Friars Preachers or Dominicans (q.v.), and the Premonstratensians (q.v.). The Canons Regular of St Augustine, or Austin Canons, appear to have been founded or remodelled about the middle of the 11th century. Their discipline was less severe than that of monks properly so called, but more rigid than that of the secular or parochial clergy. They lived under one roof, having a common dormitory and refectory. Their habit was a long cassock, with a white rochet over it, all covered by a black cloak or hood, whence they were often called Black Canons. Probably founded at Avignon about 1061, they had their first seat in England at Colchester (circa 1105); and at the Reformation their houses somewhat exceeded 200 in number. Of some 25 houses in Scotland, the earliest was that of Scone (1114), and the others of most note were at Inchcolm in the Firth of Forth, St Andrews, Holyrood, Cambuskenneth, and Inchaffray.

The Begging Hermits, Hermits of St Augustine, or Austin Friars, were a much more austere order, renouncing all property, and vowing to live by the voluntary alms of the faithful. They are believed to have sprung from certain societies of recluses who, in the 11th and 12th centuries, existed especially in Italy without any regulative constitution. At the instigation, as is alleged, of the

rival fraternities of Dominicans and Franciscans, Pope Innocent IV., about the middle of the 13th century, imposed on them the rule of St Augustine, whom they claimed as their founder. In 1256 Pope Alexander IV. placed them under the control of a superior or president called a 'general.' In 1287 a code of rules or constitutions was compiled, by which the order long continued to be governed. About 1570 Friar Thomas of Jesus, a Portuguese brother of the order, introduced a more austere rule, the disciples of which were forbidden to wear shoes, whence they were called *discalceati*, or 'bare-footed friars.'

The degeneracy of the order in the 14th century, called into existence new or reformed Augustinian societies, among which was that Saxon one to which Luther belonged. But in his day, even these had fallen victims to the general corruption of monasticism, and were not undeserving of his unsparing denunciations. After the French Revolution, the order was wholly suppressed in France, Spain, and Portugal, and partly in Italy and Southern Germany. It was diminished even in Austria and Naples. It is most powerful in America, its colleges in the New World having been founded by Augustinians from the Irish province, and at present it possesses about a dozen houses in Ireland and one in London.

The name of Augustines was given also to an order of nuns who claimed descent from a convent founded by St Augustine at Hippo, and of which his sister was the first abbess. They were vowed to the care of the sick and the service of hospitals. The Hôtel-Dieu at Paris is still served by them.

Augusto'vo, a town of Russian Poland, in the government of Suwalki, on the Netta, a feeder of the Bug, 138 miles NE. of Warsaw. It was founded by Sigismund Augustus, king of Poland, in 1547. It has woollen and linen manufactures, and some trade in horses and cattle. Pop. (1879) 11,094.

Augustulus, ROMULUS, the last emperor of the western half of the old Roman empire. His name was Augustus, but the diminutive title under which he is universally known was given him by the Romans on account of the essential littleness of his character. His father, Orestes, a Pannonian of good birth and wealth, had risen to high rank under the Emperor Julius Nepos, whose favour he repaid by stirring up the barbarian troops in the pay of Rome to mutiny against him. On the flight of the emperor, Orestes conferred the vacant throne on his son Augustulus (476 A.D.), retaining all substantial power in his own hands. Orestes failing to conciliate the barbarians, who had helped him against Nepos, with a grant of one-third of the lands of Italy, they, under the command of Odoacer, besieged him in Pavia, and killed him on the capture of the town. Augustulus yielded at once, and being of too little consequence to be put to death, was dismissed to a villa near Naples with an annual pension of 6000 pieces of gold. His after-fate is unknown.

Augustus, CAIUS JULIUS CÆSAR OCTAVIANUS, son of Caius Octavius and Atia (Julius Cæsar's niece), was born in 63 B.C. The Octavian family came originally from Velitræ, in the country of the Volsci; and the branch to which Augustus belonged was rich and honourable. His father had risen to the rank of senator and prætor, but died in the prime of life, when Augustus was only four years old. Augustus was carefully educated in Rome under the guardianship of his mother and his step-father; and his talents recommended him to his great-uncle, Julius Cæsar, who adopted him as his son and

heir. At the time of Cæsar's assassination (44 B.C.), Augustus was a student under the celebrated orator Apollodorus, at Apollonia in Illyricum, whither, however, he had been sent chiefly to gain practical instruction in military affairs. He returned to Italy, and, now first learning that he was his uncle's heir, assumed the name of Julius Cæsar Octavianus. The soldiers at Brundisium saluted him as Cæsar; but he declined their offers, and entered Rome almost alone. The city was at this time divided between the republicans and the friends of Mark Antony; but the latter, by adroit manœuvres, had gained the ascendancy, and enjoyed almost absolute power. At first, Augustus was haughtily treated by Antony, who refused to surrender Cæsar's property; but after some fighting, in which Antony was worsted, and forced to flee across the Alps, Augustus, who had made himself a favourite with the people and the army, obtained the consulship, and carried out Cæsar's will. He found an able advocate in Cicero, who at first had regarded him with contempt. To himself the great orator seemed to be labouring in behalf of the republic, whereas he really was only an instrument for raising Augustus to supreme power. When Antony returned from Gaul with Lepidus, Augustus threw off the republican mask, and joined them in establishing a triumvirate. He obtained Africa, Sardinia, and Sicily; Antony, Gaul; and Lepidus, Spain. Their power was soon made absolute by the massacre of those unfriendly to them in Italy, and by the victory at Philippi over the republicans under Brutus and Cassius. The Perusian war, excited by Fulvia, wife of Antony, seemed likely to lead to a contest between Augustus and his rival; but was ended by Fulvia's death, and the subsequent marriage of Antony with Octavia, sister of Augustus. Shortly afterwards, the Roman world was divided anew, Augustus taking the western half, and Antony the eastern, whilst Lepidus had to content himself with Africa. The contest for supremacy commenced. While Antony was lost in luxurious dissipation at the court of Cleopatra, Augustus was industriously striving to gain the love and confidence of the Roman people, and to damage his rival in public estimation. War was at length declared against the Egyptian queen, and at the naval battle of Actium (31 B.C.), Augustus was victorious, and became sole ruler of the whole Roman world. Antony and Cleopatra soon afterwards ended their lives by suicide; Antony's son by Fulvia, and Cæsarion, son of Cæsar and Cleopatra, were put to death; and in 29 B.C., after regulating affairs in Egypt, Greece, Syria, and Asia Minor, Augustus returned to Rome in triumph, and, closing the temple of Janus, proclaimed universal peace.

His subsequent measures were mild and prudent. To insure popular favour, he abolished the laws of the triumvirate, and reformed many abuses. Hitherto, since Cæsar's death, he had been named Octavian; but now the title of *Augustus* ('sacred' or 'consecrated') was conferred on him. In his eleventh consulship (23 B.C.), the tribunician power was granted him for life by the senate. Republican names and forms still remained, but they were mere shadows; and Augustus, in all but name, was absolute monarch. In 12 B.C., on the death of Lepidus, he had the high title of Pontifex Maximus bestowed on him. The nation surrendered to him all the power and honour that it had to give.

After a course of victories in Asia, Spain, Pannonia, Dalmatia, Gaul, &c., Augustus (9 B.C.) suffered the one crushing defeat of his long rule, in the person of Quintilius Varus, whose army was

annihilated by the Germans under Arminius (q.v.). The loss so afflicted Augustus, that for some time he allowed his beard and hair to grow, as a sign of deep mourning, and often exclaimed: 'O Varus, Varus, give me back my legions!' Thenceforth he confined himself to plans of domestic improvement and reform, and so beautified Rome, that it was said, 'Augustus found the city built of brick, and left it built of marble.' He also built cities in several parts of the empire; and altars were raised by the grateful people to commemorate his beneficence; while by a decree of the senate, the name Augustus was given to the month *Septilis*.

Though thus surrounded with honour and prosperity, Augustus was not free from domestic trouble. The abandoned conduct of his daughter Julia was the cause of sore vexation to him. He had no son, and his nephew Marcellus, and Caius and Lucius, his daughter's sons, whom he had appointed as his successors and heirs, as well as his favourite step-son Drusus, all died early; while his step-son Tiberius was an unamiable character whom he could not love. Age, sorrow, and failing health warned him to seek repose; and, to recruit his strength, he undertook a journey to Campania; but his infirmity increased, and he died at Nola (14 A.D.), in the seventy-seventh year of his age. According to tradition, shortly before his death, he called for a mirror, arranged his hair neatly, and said to his attendants: 'Did I play my part well? If so, applaud me!' Augustus had consummate tact and address as a ruler and politician, and made use of the passions and talents of others to forward his own designs. The good and great measures which marked his reign were originated mostly by himself. He encouraged agriculture, patronised the arts and literature, and was himself an author; though only a few fragments of his writings have been preserved. Horace, Virgil, Ovid, Propertius, Tibullus, and Livy—greatest of Latin poets and scholars—belonged to the *Augustan Age*, a name since applied in France to the reign of Louis XIV., in England to that of Queen Anne.

Augustus, Elector of Saxony (1553–86), was born July 31, 1526, at Freiberg, and spent much of his boyhood at Prague, where he formed an intimate friendship with Maximilian, King Ferdinand's son, afterwards Emperor of Germany. In 1548 he married Anna, daughter of Christian III. of Denmark, who was universally popular on account of her devoted adherence to Lutheranism and her domestic worth. After the death of his brother Maurice in 1553, Augustus succeeded to the electorate. His rule is chiefly noticeable as bearing upon the history of the newly established Protestant Church. Equally intolerant and inconsistent in his theology, Augustus first used his utmost influence in favour of the Calvinistic doctrine of the sacraments; and then, in 1574, adopted the Lutheran tenets, and persecuted the Calvinists. On the other hand, it must be owned that he introduced valuable reforms in both jurisprudence and finance, and gave a decided impetus to education, agriculture, manufactures, and commerce. The Dresden Library owes its origin to him, as do also most of its galleries of art and science. He died at Dresden, February 11, 1586, and was succeeded by his son, Christian I.

Augustus II. (more accurately, **FREDERICK-AUGUSTUS I.**), Elector of Saxony and king of Poland, second son of the Elector, John George III., was born at Dresden, May 12, 1670. His extraordinary strength gained him the nickname of 'the Strong.' From 1687 to 1689 he travelled over the greater part of Europe, and in 1694 succeeded his brother George as Elector, and

undertook the command of the imperial army against the Turks in Hungary. After the battle of Olasch, in 1696, he returned to Vienna as a candidate for the throne of Poland, vacated by John Sobieski. Bidding higher than Prince Conti for the crown, and adopting the Catholic faith, he was elected king by the venal nobles, and was crowned in 1697. On ascending the throne, he promised to regain, for his new kingdom, the provinces that had been ceded to Sweden; but his efforts to do this only led to the defeat of himself and his allies, his own deposition as king of Poland, the election of Stanislaus Leszcynski, and the ignominious peace of Altranstädt in 1706. So complete was his humiliation, that Augustus was compelled to send a letter of congratulation to the new Polish king, together with all the crown-jewels and archives. However, on the defeat of Charles XII. at Pultowa, in 1709, he declared the treaty of Altranstädt annulled, marched with a powerful army into Poland, formed a fresh alliance with the czar, and recommenced a war with Sweden, which continued raging with redoubled fury, till the death of Charles XII., in 1718, led to a peace with Sweden. Meanwhile, the jealousy of the Poles caused the withdrawal of the Saxon troops in 1717. The remainder of the reign is marked by no important event, till the king's death, 1st February 1733. The Saxon court gradually became known as the most dissolute in Europe, and the resources of both kingdoms were shamefully squandered to supply its extravagances. Augustus supported the fine arts as ministering to luxury, but did little for the cause of science. Reckless, selfish, ambitious, luxurious, licentious, and despotic, he is powerfully depicted in Carlyle's *Frederick the Great*. By his wife he left an only son, who succeeded him. The most celebrated of his numerous illegitimate offspring—amounting, it is affirmed, to somewhere about 300—was Count Maurice of Saxony.

Augustus III. (or **FREDERICK-AUGUSTUS II.**), the son and successor of the above, was born at Dresden, October 7, 1696, and carefully educated by his mother in the Protestant faith. In the course of a tour through Europe, however, he changed his religion, secretly professing Catholicism at Bologna in 1712, though the fact was not publicly known in Saxony till five years later. He succeeded his father as Elector in 1733, and was chosen king of Poland by a part of the nobility. Jealousy of French influence secured him the support of Russia and Austria against Stanislaus Leszcynski, who had married a daughter of Louis XV., and three years later Augustus was elected. He inherited his father's sumptuous tastes, though not his talents; and he enriched the gallery of Dresden with noble paintings, for which, and its china, his capital now began to be celebrated. In 1742, alarmed at the increased power Prussia had obtained by the conquest of Silesia, Augustus formed an alliance with Maria Theresa: and by the secret treaty of Leipzig, contracted to supply her with 50,000 men. But their united troops were completely routed by the Prussians in 1745; and Frederick II. pushing on into Saxony, Augustus had to escape from his capital, saving his art-treasures, but leaving his state-papers in the hands of the conqueror. In 1746 the peace of Dresden restored him Saxony; but the close of the year again saw him embroiled with Prussia. Joining the camp at Pirna, he narrowly escaped being taken prisoner, and had to flee to Poland. At the conclusion of the peace of Hubertsburg, Augustus returned to Dresden, where he died, October 5, 1763. The notorious Count Brühl (q.v.) was his favourite, and from 1746

onwards, his prime-minister. His son, Frederick-Christian, succeeded him in the electorate, and Stanislaus Poniatowski became king of Poland.

Auk (*Alca*), a genus of web-footed birds, the type of a family called Alcæde, which was in great part included in the Linnæan genus *Alca*, and to many of the species of which, now ranked in other genera, the name auk is still popularly extended. The Alcæde are amongst those web-footed birds collectively called Brachypteres (i.e. short-winged) or Divers by Cuvier, remarkable for the shortness of their wings, which they employ as fins or paddles for swimming under water, some being even incapable of flying; and for the position of their legs, further backward than in other birds, which makes walking difficult, and compels them, when on land, to maintain an upright attitude. They are distinguished by the very compressed bill, which, in the true auks, is vertically elevated, and so sharp along the ridge as to resemble the blade of a knife; and by their entirely palmated feet, destitute of hind toes. The auks are confined solely to the seas of the northern hemisphere—the penguins taking their place in the southern. All of them have a dense plumage, which generally exhibits on its surface a beautifully polished appearance and silvery lustre. The genus *Alca*, as restricted by Cuvier and others, contains only two species, distinguished from the Puffins (q.v.), which also belong to this family, chiefly by the greater length of the bill, and its being covered with feathers as far as the nostrils. The bill, both in the auks and puffins, is transversely and strongly grooved. But even the two known species of the

The Great Auk (*Alca impennis*).

restricted genus *Alca* differ from one another in a most important particular—the wings of the one, the Great Auk, being so short that it is quite incapable of flight, like the penguins, of which it may be deemed the true northern representative, whilst the other, the Razor-bill, has comparatively long wings, and flies well.—The GREAT AUK (*Alca impennis*), so far as is known, is now extinct. It was about three feet in height. It was an inhabitant of the temperate region of the North Atlantic. At one time large numbers bred on St Kilda, and in prehistoric times it appears to have bred on Oronsay or neighbouring skerries, and possibly frequented other islands of the Hebrides. It occasionally was met with at Orkney and Shetland, and probably bred at Papa Westra until 1812. It was rarely met with along the shores

of Norway and Sweden, but in prehistoric times frequented the fjords of Denmark, as its remains have been repeatedly found in the Danish kitchen-middens. There is only one breeding-place in Greenland on record, and that is Gunnbjorneskjoerne, supposed to be the same as Danell's or Graah's Islands. It bred on several skerries off the coast of Iceland, and the last Great Auks are supposed to have been killed on one of these named Eldey in 1844. In the North American habitat it bred in great numbers on Funk and other islands off the coast of Newfoundland, on some islands in the Bay of St Lawrence, at Cape Breton, and probably at Cape Cod. Its remains have been found in shell-heaps at several places on the coast of Maine and Massachusetts. The Great Auk was invaluable as food, and but for the abundant fresh supplies afforded by its carcasses to the early voyagers, the fisheries at the Banks of Newfoundland would hardly have been developed as they were. The birds were so stupid, they sat still until they were knocked over by the seamen's short clubs, or allowed themselves to be driven on board the vessels in hundreds across sails or planks stretched from the gunwales to the shore. The rapidity with which this bird moved under water was extraordinary; one of them having been pursued by a six-oared boat for hours in vain. Like most of the Alcadae, the Great Auk each year laid only one egg, about 5 inches in length, and 3 in maximum breadth. It laid it on the bare rock, without any attempt at a nest. The eggs of the Great Auk are scarce and valuable curiosities; they have repeatedly brought more than £100, and in 1888 one was sold by auction for £225. At that date only 66 auk's eggs were known to exist; and only some 72 skins and 40 bones of the Great Auk are to be found in collections.—The RAZOR-BILL (q.v.) is the only other species (*A. torda*) now commonly included in the genus *Alca*. The name LITTLE AUK (*Mergulus alle*, formerly *Alca alle*) is often given to a bird also called the Roche (q.v.), common in Arctic regions.—All the auks feed upon fishes, crustaceans, and other marine animals, which they pursue under water, and for which they dive to great depths. See Symington Grieve's *The Great Auk* (Edin. 1885).

Aulapolai', or ALLEPPI, a seaport, with a lighthouse, in Travancore state, Madras, 33 miles S. of Cochin. Its roadstead is sheltered by a mud-bank; and there is a considerable trade in coffee, coir, pepper, and cardamoms. Communication is maintained with Quilon and Trivandrum on the south, and with Cochin on the north, by canals parallel with the sea-coast, and connecting a series of lakes or back-waters. Between these and the sea is a wide creek, through which is floated the timber for exportation, which is brought from the forests of the Rajah of Travancore on the Western Ghats. Pop. 30,000.

Aula Regis, also called CURIA REGIS, is a name used in English history for a feudal assembly of tenants-in-chief, for the Privy-council (q.v.), and for the court of King's Bench (q.v.).

Aulic Council (Lat. *aula*, 'court' or 'hall'; Ger. *Reichshofrath*), a court of the Holy Roman empire, established in 1501 by Maximilian I., and co-ordinate with the Imperial Chamber (Reichskammergericht, 1495). See HOLY ROMAN EMPIRE.

Aul'us Gellius. See GELLIUS.

Aumale (earlier *Albemarle*), a French town of 2000 inhabitants, in the department of Seine-inférieure, on the Breste. Since 1547 it has given the title of duke to various families.—AUMALE, a town of Algeria, 57 miles SE. of Algiers. It is

a strong military post, with barracks, magazines, and hospitals. Pop. 5196.

Aumale, CHARLES DE LORRAINE, DUC D', born 1556, was an ardent partisan of the League in the religious wars which devastated France in the latter half of the 16th century. The aim of the League was ostensibly to suppress the Huguenots, but in reality to secure the supreme power to the Guises. Closely allied by blood to this crafty and ambitious family, Aumale, after the murder of the Duke of Guise in 1588, became, along with the Duke of Mayenne, the leader of the party. Defeated at Senlis by the Duke of Longueville, and at Arques and Ivry by Henry IV., he still attempted to defend Paris, and when Henry was recognised as king in France, he went over to the Spaniards, refused the royal pardon, and delivered over to the enemy several places in his possession. For this he was impeached, condemned, and sentenced to be broken alive on the wheel. His property was confiscated, but he himself escaped. He lived in exile till his death, which took place at Brussels in 1631. With him the old Dukes d'Aumale of the house of Lorraine became extinct.

Aumale, HENRI - EUGÈNE - PHILIPPE - LOUIS D'ORLÉANS, DUC D', fourth son of King Louis-Philippe, was born at Paris, January 16, 1822. Educated at the college of Henri IV., at sixteen he entered the army, and two years later found himself in active service in Algeria, where he soon distinguished himself by his bravery, and passed rapidly through the various grades of rank. One of his most brilliant exploits was the surprise of Abd-el-Kader in May 1843. For this he was made lieutenant-general, and appointed to the government of the province of Constantine. In 1847 he succeeded Marshal Bugeaud in the governor-generalship of Algeria, but after the revolution of February 1848, laid down his office, and retired to England. In his exile he occupied himself with historical and military studies, and soon became known by his contributions to the *Revue des Deux Mondes*. A speech of Prince Napoleon in the senate against the Orleans family called forth in April 1861 his famous pamphlet, *Lettre sur l'Histoire de France*, in which the prince and Napoleon III. were subjected to a merciless castigation. His great historical work, *Histoire des Princes de Condé* (Paris, 1869), was published only after much difficulty. In the journal *Étoile Belge* there appeared (1865-66) a series of critical letters by him, under the pseudonym of 'Verax,' on the policy of the empire, and in 1867 his celebrated work, *Les Institutions militaires de la France*. On the outbreak of the Franco-German war, he offered his services, first to the emperor, afterwards to the provisional government, without being accepted by either, but in 1871 he was elected a member of the Assembly. In 1873 he presided over the council of war which tried Marshal Bazaine, and afterwards held several high military commands, but was removed from the last of these, the post of inspector-general of the army, in 1883. Elected a member of the Academy in 1871, in 1886 he made known his intention to bequeath his magnificent chateau of Chantilly to the Institute of France. His wife (*née* Marie Caroline Auguste de Bourbon, daughter of the Prince of Salerno) had died in 1867; as well as his two sons, the elder in 1866, the younger in 1872.

Aune, the French cloth-measure corresponding to the English *Ell* (q.v.).

Aungerville, RICHARD, Bishop of Durham, is known as Richard de Bury, from his birthplace, Bury St Edmunds. He was born in 1281, studied with distinction at Oxford, became a Benedictine monk at Durham, and was made tutor to Edw. and

of Windsor, afterwards Edward III., by whom in after-years numerous honours were bestowed upon him. In 1333 he was appointed Dean of Wells, and in the same year was made Bishop of Durham by the pope at the king's request, despite the fact of the monks having elected their sub-prior, Robert de Graystanes. After holding the office of high chancellor for a year, he resigned it in 1335 to act as the king's ambassador in Paris, Hainault, and Germany. In 1337 he was employed as a commissioner for the affairs of Scotland, and in 1342 he arranged a truce with the Scottish king. He died in 1345. Richard administered the affairs of his diocese with ability, as appears from his chancery rolls, which are the earliest preserved in the archives of Durham. An admirable ecclesiastic, he was kind and charitable to the poor. But he is chiefly known as a scholar and patron of learning, and he used his high offices of state to gratify his passion for discovering manuscripts and collecting books. His principal work, *Philobiblon*, was intended to serve as a handbook to the library which he founded in connection with Durham College at Oxford (afterwards suppressed). It gives an interesting account of how he collected his library, describes the state of learning in England and France, and closes with an explanation of the rules for the management of his library, which were founded on those adopted for the library of the Sorbonne. He had wide literary sympathies, commended the study of the poets, and provided his library with Greek and Hebrew grammars as a means of correcting the prevailing ignorance of these languages. At the dissolution of the monasteries, the books of his library went partly to the Bodleian, partly to Balliol College, and partly to the purchaser of Durham College.

Aurantia'ceæ (from late Lat. *aurantium*, 'an orange'), an order of Thalamifloral Dicotyledons, frequently grouped under Rutaceæ, are trees and shrubs, often of great beauty. The order contains about one hundred known species, natives of warm climates, and almost all of the East Indies, but now largely diffused by cultivation. The species of the genus *Citrus* are the best known, among which are the orange, lemon, citron, &c. But many other genera produce agreeable fruits, among which the Bael-fruit (*Ægle marmelos*, q.v.) and the Wampee (*Cookia punctata*) deserve particular notice. The fruits, ripe and unripe, juice and rind, the flowers, leaves, bark, &c. of a number of species are employed medicinally, their properties being largely due to the fragrant volatile oil, which abounds especially in the leaves and the rind of the fruit. See BÆL-FRUIT, CITRON, LEMON, LIME, ORANGE, SHADDOCK.

Auray, a port in the French department of Morbihan, 20 miles E. of Lorient by rail, with some trade. Pop. 5000. Here is a large deaf and dumb institute; and 2 miles north is the famous place of pilgrimage of St Anne of Auray, with a fine church completed in 1877.

Aurelia. See CHRYSALIS.

Aurelianus, LUCIUS DOMITIUS—also named CLAUDIUS DOMITIUS and VALERIUS—one of the most powerful of the Roman emperors, was of very humble origin, his father having been a husbandman. He was born in Dacia or Pannonia about 212 A.D., and enlisting early as a common soldier, he rapidly distinguished himself, and held the highest military offices under Valerianus and Claudius II. On the death of Claudius (270), Aurelian was elected emperor by the army, with whom his great stature, strength, and courage had made him very popular. He commenced his reign by repulsing the barbarian Alemanni Marcomanni, and then proceeded to erect a new

line of fortified walls round Rome, the ruins of which may still be traced. Finding that the province of Dacia could not be maintained against the assaults of the Goths, he surrendered it on certain conditions, and strengthened the frontier of the Roman empire by making the Danube its boundary. He next turned his attention to the East, where the renowned queen, Zenobia (q.v.), had extended her sway from Syria to Asia Minor and Egypt. Aurelian defeated her in two battles, and besieged her in Palmyra, from which she attempted to escape when she saw defence would prove unavailing. She was, however, taken prisoner, and soon after the city surrendered, and was treated leniently. Shortly after he had departed, a new insurrection took place. He returned in 273, and gave the splendid city up to destruction. Aurelian was again called to the East by a rebellion in Egypt, instigated by Firmus, a merchant of great influence, which he speedily quelled. In Gaul, Tetricus, who had held imperial power since before the death of Gallienus, finding himself unable to wield it, surrendered it to Aurelian. By restoring good discipline in the army, order in domestic affairs, and political unity to the Roman dominions, this prince merited the title awarded to him by the senate—'Restorer of the Roman Empire.' He was assassinated at the instigation of a faithless secretary, between Hæcæa and Byzantium, during his campaign against the Persians (275).

Aurelius. MARCUS AURELIUS ANTONINUS, the best of the Roman emperors, and one of the noblest figures in history, was the son of Annius Verus and Domitia Calvilla, and was born at Rome on the 26th of April 121 A.D. His original name was Marcus Annius Verus. On the death of his father, he was adopted by his grandfather, who spared no pains to render him pre-eminent in every art and science. His fine qualities early attracted the notice of the Emperor Hadrian, who, playing on the boy's paternal name of Verus, used to call him *Verissimus* ('the most true'), and who conferred high honours on him while yet a child. When only seventeen years of age, he was adopted, along with L. Ceionius Commodus, by Antoninus Pius, who had succeeded Hadrian; and Faustina, the daughter of Pius, was selected for his wife. In the year 140 A.D. he was made consul; and from this period to the death of Pius in 161, he continued to discharge his public duties with the greatest promptitude and fidelity, while he maintained relations with the emperor of the warlike and most friendly kind. On his accession to the throne, with characteristic magnanimity he voluntarily divided the government with his adopted brother, young Commodus, called since his adoption Lucius Aurelius Verus. As the latter excelled in manly exercises, Aurelius determined to intrust to him the management of war. Towards the close of 161, the Parthian war broke out, and Verus was sent to quell it; but he proved himself completely incompetent, and only the ability of his generals, especially Avidius Cassius, saved the Romans from disaster. Verus on his return enjoyed a triumph to which he had no real claim; for all the victories had been won by others while he was revelling in the most extravagant licentiousness. Meanwhile clouds were forming on the horizon elsewhere. A formidable insurrection had long been preparing in the German provinces; the Britons were on the point of revolt, and the Catti waiting for an opportunity to devastate the Rhenish provinces. Within Rome itself a pestilence began to rage, believed to have been brought home by the troops of Verus; while frightful inundations and earthquakes laid large portions of the city in ruins, destroyed the granaries in which were kept

the supplies of corn, and thus created widespread famine and distress, adding to the terror which the citizens entertained of their savage enemies. Aurelius now resolved to lead his legions to the war himself. He was completely successful. The Marcomanni, and the other rebellious tribes inhabiting the country between Illyria and the sources of the Danube, were humbled, and compelled to sue for peace in 168; a year later Verus died. The contest was renewed two years afterwards, and the emperor was obliged to make up for the ravages of plague among his soldiers by enlisting vast numbers of gladiators and slaves. He made Pannonia his headquarters, and drove out the Marcomanni, whom he subsequently all but annihilated in crossing the Danube. The most famous victory of the war was that gained over the Quadi in 174 A.D., which was attributed by the Christians to an answer to the prayers of some soldiers of their faith in what afterwards became known as the 'Thundering Legion.' It is certain that a signal deliverance did save the army from disaster. Entangled in a defile, and under a broiling sun, the soldiers were ready to perish from thirst and fatigue, when suddenly the cloudless sky darkened, and heavy showers of rain fell, which they caught eagerly in their helmets. While they were thus engaged, the enemy attacked, and would have cut them to pieces had not a blinding storm of hail and lightning fallen immediately on their faces. But this deliverance was ascribed by the Romans to the prayers of the emperor himself, and it is certain that the title in question had belonged to a particular legion since the time of Augustus. The effect of this remarkable victory was instantaneously and widely felt. The Germanic tribes hurried from all quarters to make their submission, and obtain clemency. Hardly had the emperor had a moment's respite before he was summoned to the East by a rebellion of the ambitious governor, Avidius Cassius, who had seized the whole of Asia Minor. Before Aurelius arrived, the usurper had fallen by an assassin's hand. The emperor's conduct on hearing of his enemy's death was worthy of the sublime virtue of his character. He lamented that the Fates had not granted him his fondest wish—to have freely pardoned the man who had so basely conspired against his happiness. On his arrival in the East, he exhibited the same illustrious magnanimity. He burned the papers of Cassius without reading them, so that he might not be tempted to suspect any as traitors; treated the provinces which had rebelled with extreme gentleness; and disarmed the enmity and dispelled the fears of the nobles who had openly favoured his insurgent lieutenant. While pursuing his work of restoring tranquillity, his wife Faustina died in an obscure village at the foot of Mount Taurus; and her husband, though he could scarcely have been unconscious of her unworthiness, paid the most lavish honours to her memory.

On his way home he visited Lower Egypt and Greece, displaying everywhere the greatest solicitude for the welfare of his vast empire. At Athens, which this imperial pagan philosopher must have venerated as a pious Jew venerates Jerusalem, he showed a catholicity of intellect worthy of his great heart, by founding chairs of philosophy for each of the four chief sects—Platonic, Stoic, Peripatetic, and Epicurean. No man ever laboured more earnestly to make that heathen faith which he loved so well, and that heathen philosophy which he believed in so truly, a vital and dominant reality. Towards the close of the year 176, he reached Italy, and celebrated his merciful and bloodless triumph. In the succeeding autumn he departed for Germany, where fresh disturbances had broken out among the restless and volatile

barbarians. Victory again crowned his arms; but his constitution, never robust, and now shattered by perpetual anxiety and fatigue, at length gave way, and he died either at Vienna or at Sirmium, on the 17th of March 180, in the fifty-ninth year of his age, and the twentieth of his reign.

Marcus Aurelius was the flower of the Stoic philosophy. It seems almost inexplicable that so harsh and crabbed a system should have produced as pure and gentle an example of humanity as the records of either pagan or Christian history can show. In him stoicism loses all its haughty self-assertion, and is replaced by a humility that is usually regarded as the most peculiar, if almost the rarest, of the Christian graces. His youth was marked by the same lofty virtue as his maturer life. Already at twelve years of age the young philosopher was an avowed follower of Zeno and Epictetus. The Stoics, Diogenes, Apollonius, and Junius Rusticus, were his teachers, and he himself must be considered one of the most thoughtful teachers of the school. Oratory he studied under Herodes Atticus and Cornelius Fronto. His love of learning was insatiable. Even after he had attained to the highest dignity of the state, he did not disdain to attend the school of Sextus of Chersonese, a grandson of the celebrated Plutarch. Men of letters were his most intimate friends, and received the highest honours both when alive and dead. His own range of studies was extensive, embracing morals, metaphysics, mathematics, jurisprudence, music, poetry, and painting. There are few books that have had such a potent charm over so many hearts as the sad *Meditations* of Aurelius. His sentences reveal the loneliness of his soul, but they show us that he did not suffer himself to be embittered as well as saddened by his experience of life. A kind of self-revelation, marked by a penetrating insight, they reveal the rare serenity and elevation of his heart, and its rarer tenderness and pity. We must not forget that he did not cultivate philosophy merely in the spring-time of his life, when enthusiasm was strong, and experience had not saddened his thoughts, and when study was his only labour, but during the tumults of perpetual war, and the distraction necessarily arising from the government of so vast an empire. The man who loved peace with his whole soul died without beholding it, and yet the everlasting presence of war never tempted him to sink into a mere warrior. He maintained uncorrupted to the end of his noble life his philosophic and philanthropic aspirations. After his decease, which was felt to be a national calamity, every Roman citizen, and many others in distant portions of the empire, procured an image or statue of him, which more than a hundred years after was still found among their household gods. He became almost an object of worship, and was believed to appear in dreams, like the saints of subsequent Christian ages.

Aurelius twice persecuted the Christians: in the first persecution (166) Polycarp perished; in the second (177), Irenaeus. Many have found it difficult to understand how a mind of such lofty virtue should have consented to the persecution of Christianity. The explanation is to be found in that very earnestness with which he clung to the old faith of his ancestors. He believed it to be true, and to be the parent of those philosophies which had sprung up out of the same soil; he saw that a new religion, the character of which had been assiduously, though perhaps unconsciously, misrepresented to him, both as an immoral superstition and a mysterious political conspiracy, was secretly spreading throughout the empire, and that it would hold no commerce with the older religion, but condemned it, generally in the strongest terms. It was therefore compara-

tively easy, even for so humane a ruler, to imagine it his duty to extirpate this unnaturally hostile sect. As a ruler he felt that he dared not let society fall to pieces, and that it was his duty to preserve the ties of time-honoured custom, which apparently knit it together.

The best edition of his *Meditations* is still that with Latin notes by Gataker (London, 1697). The work is written in Greek, and small as it is, is one of the most precious relics of antiquity. Translations are numerous in every European language—a good one in English is that by George Long (1869). See Renan's *Marc Aurèle* (1882), and Watson's *Life of Marcus Aurelius Antoninus* (New York, 1884).

Aurich, a town in the Prussian province of Hanover, almost in the centre of East Friesland, 16 miles N.E. of Emden by rail. It has a large horse-market, and brews celebrated beer. Pop. (1885) 5399.

Auricles, two cavities of the heart. See HEART.

Auric'ula, a genus, and **Auricu'lidæ**, a family of Gasteropod Mollusca (Lat. *auricula*, 'a little

Auricula.

ear'). They have a spiral shell, covered with a horny epidermis, the first whorl very large and the spire short, the lip elongated, thickened, and toothed. The respiratory organ, or 'lung,' is a space below the mantle, on the walls of which the blood is exposed to the freely admitted air. They thus belong to the Pulmonate order of Gasteropods—i.e. to the same order as the common snails, having respiratory organs adapted for breathing in air, though some of them are capable of subsisting for a considerable time in water. Some inhabit fresh-water marshes, while others prefer the vicinity of salt water. They generally belong to warm climates, and some of them attain a large size. *Auricula midæ*, a native of the East Indies, is known to shell-collectors by the name of Midas's Ear.

Auric'ula (*Primula auricula*), a congener of the Primrose (q.v.), much cultivated in flower-gardens. The auricula has long been a florist's flower. It was highly esteemed by the Romans, and has, at least since the 17th century, received particular attention from the florists of England and Holland. It is one of those flowers the cultivation of which is often most successfully prosecuted in the little gardens of operatives near large towns. Lancashire is particularly famous for it.—The auricula has smooth, dark-green leaves, stems, and calices, covered with a mealy powder. A similar fine dust appears also on the flowers, and adds much to their beauty. Hence the popular name in Scotland of 'Dusty Miller.' The auricula is a native of the Alps and other mountains of the middle and south of Europe, and of sub-alpine situations in the same countries. It is found also on the Caucasus and the mountains of Syria; it grows in shady and moist places. In a wild state it has comparatively small flowers, of a simple yellow colour, on short stalks, forming an umbel of generally six or seven flowers, with the same delightful fragrance which aids so much to make it a favourite flower in cultivation. The leaves are

used by the inhabitants of the Alps as a remedy for coughs.

By cultivation and selection the auricula has been brought to great beauty and splendour of colour. More than 1200 varieties were reckoned as early as 1850, and new ones are continually raised from seed. All shades and combinations of

Auricula (*Primula auricula*).

yellow, maroon, and purple, usually disposed in concentric rings, are predominant; and English florists classify these into five main types, green-edged, white-edged, gray-edged, self-coloured, and alpines, the latter having the margin of two blended colours with a yellow centre. The mealiness of the flower differs much in different varieties. The auricula blooms in April and May, and often also a second time at the end of autumn, which adds to the charms of the flower-border, although it is to the first or proper flowering-season that the florist looks. It succeeds best in a rich light soil, and cultivators diligently prepare for it composts of various kinds, but in general consisting chiefly of fresh loamy soil, and of well-rotted horse or cow dung, often with the addition of a little sand. The finer varieties are always cultivated in pots, and require protection from severe weather in winter, and from wind and rain while flowering. They ought, however, previous to flowering, to stand in an airy, sunny situation. They are propagated by offsets, generally in the latter part of August. When it is proposed to raise the auricula from seed, care ought to be taken to select the finest flowers, which are encouraged to ripen their seeds by exposure to sun and air, hand-glasses being placed over them during heavy rains. The seed is sown either in autumn or spring, generally in boxes placed under shelter, or in a slight hot-bed. The more weakly plants are tended with particular care, as they are generally found to produce the finest flowers.

The name auricula is derived from *auris*, an ear, on account of a fancied resemblance of the leaf to the ears of an animal.

Auricular Confession. See CONFESSION.

Auric'ulate, in Botany, a term applied to leaves, stipules, &c. and signifying that they have at the base two small ear-like lobes.

Aurillac, capital of the department of Cantal, in the southern part of Central France, on the right bank of the Jourdanne, 116 miles SW. of Clermont by rail. The town is mainly modern, but contains an old castle and two churches of the 14th and 15th centuries. It manufactures lace, copper vessels,

chemicals, chocolate, and cement, and has a trade in horses, cattle, and cheese. Annual races are held here, and there are two mineral wells. Here Pope Sylvester II. was born. Pop. (1881) 12,860.

Aurochs is properly the German name of the extinct species of wild ox, called by Cæsar *Urus* (q.v.). Recently the name has been erroneously used for the Bison (q.v.), still found in Lithuania.

Aurora, an enterprising city of the United States, in Kane county, Illinois, is located on Fox River, at the junction of several railroads, 39 miles WSW. of Chicago. It has machine-shops, flour-mills, manufactories of woollens, cottons, watches, corsets, silver ware, carriages, and extensive railroad workshops. Pop. (1860) 6011; (1880) 11,873; (1890) 19,688.—**AURORA** is also the name of a village in Indiana, on the Ohio, 24 miles W. by S. of Cincinnati. Pop. (1880) 4435; (1890) 3928.

Aurora, the Latin name corresponding to the Eös of Greek Mythology, the goddess of the dawn, was the daughter of Hyperion and Theia, and sister of Helios and Selene, and wife of the Titan Astræus, to whom she bore the winds, Argestes, Zephyrus, Boreas, Notus, as well as Hesperus, the morning-star. She was described as rising in the morning from her bed in the ocean, borne along on a chariot drawn by the divine steeds Lampus and Phaëthon, ascending heaven from the river Oceanus, where she lifted with her 'rosy fingers' the curtain of night, and announced the light both to gods and men. Homer frequently describes Aurora as the goddess of day, and the tragic writers identified Aurora with *Hemera* (the day). She was represented as clothed in a rosy-yellow robe, with a star shining on her forehead, and a torch in her right hand. She carried off several mortal youths of great beauty, among them Orion, Cephalus, and Tithonus.

Auro'ra Borea'lis, or **NORTHERN LIGHTS**, the name given to the luminous phenomenon which is seen towards the north of the heavens by the inhabitants of the higher latitudes. During the winter of the northern hemisphere, the inhabitants of the arctic zone are without the light of the sun for months together, and their long dreary night is relieved by this beautiful meteor, which occurs with great frequency in these regions. Those who have explored the southern seas have seen the same phenomenon in the direction of the south pole, so that the term Polar Lights might be more appropriate than Northern Lights to designate the aurora. In the phenomenon as seen in the southern hemisphere, the name aurora Australis is used. The appearance of the aurora borealis has been described by a great variety of observers in Northern Europe and in America, all of whom give substantially the same account of the manner in which the phenomenon takes place. It is briefly as follows: A dingy aspect of the sky in the direction of the north is generally the precursor of the aurora; and this gradually becomes darker in colour, and assumes the form of a circular segment, surrounded by a luminous arch, and each end approaching near to the horizon. This *dark segment*, as it is called, has the appearance of a thick cloud, and is frequently seen as such in the fading twilight before the development of the auroral light. Its density must, however, be very small, as stars are sometimes seen shining brightly through it. This dark segment is bounded by a continuous luminous arch of a transparent white with a touch of green, which varies in breadth from 1 to 6 diameters of the moon, having the lower edge sharply defined, and the upper edge only when the breadth of the arch is small. This arch may be considered to be a part of a luminous ring elevated at a considerable distance above the earth's surface, and having its

summit in most cases nearly in the magnetic meridian. An observer several degrees south of this auroral ring would see towards the north only a small arc of it, the larger part being hid by the earth; to one situated not so far south, it would appear as a larger and higher arch; to one placed below it, it would be seen as an arch passing through the zenith; and to one situated within the ring and farther north, it would be found as an arch culminating in the south. On this supposition nearly all the various positions of the auroral arch may be accounted for. The centre of the ring corresponds probably with the magnetic north, which is at present situated in the island of Boothia Felix. Hence it is that in Greenland, which is situated to the east of this island, the auroral arch has been seen stretching from north to south with its highest point in the west. The luminous arch, once formed, may remain visible for several hours, and is in a constant state of motion. It rises and falls, extends towards the east and towards the west, and breaks sometimes in one part, sometimes in another. These motions become all the more observable when the arch is about to shoot forth rays; then it becomes luminous at one point, eats in upon the dark segment, and a ray of similar brightness to the arch mounts with the rapidity of lightning towards the zenith. The ray seldom keeps the same form for any length of time; but undergoes continual changes, moving eastward and westward, and fluttering like a ribbon agitated by the wind. After some time it gradually fades in brightness, and at last gives way to other rays. When the rays are very bright, they sometimes assume a green, sometimes a violet, a purple, or a rose colour, giving to the whole a variegated and brilliant effect. When the rays darted by the luminous arch are numerous and of great length, they culminate in a point which is situated in the prolongation of the dipping-needle, somewhat south-east of the zenith. There they form what is called the *Boreal Crown*; and the whole heavens, towards the east, west, and north, present the appearance of a vast cupola of fire, supported by columns of variously coloured light. When the rays begin to be darted less brilliantly, the crown first disappears, then, here and there, the light becomes faint and intermittent, till at last the whole phenomenon fades from the sky.

The preceding description indicates the general features of the appearance of the aurora borealis; but several auroras have been described which presented striking peculiarities. Sometimes the phenomenon assumed the form of one or more curtains of light, depending from dingy clouds, whose folds were agitated to and fro, as if by the wind. Sometimes this curtain seemed to consist of separate ribbons of light, arranged side by side in groups of different lengths, and attaining their greatest brilliancy at the lower edges. In this country it is only on rare occasions, such as in 1870, that the aurora borealis occurs with the brilliancy which attends it in northern latitudes, but this description portrays the type to which such appearance of the meteor more or less approximates.

The height of the aurora has been variously estimated. The first observers were inclined to place the seat of it beyond the atmosphere; but this hypothesis is untenable, as the aurora does not seem to be affected by the rotation of the earth, but appears to be in every respect a terrestrial phenomenon. By taking observations of the altitude of the highest point of the arch of the same aurora at different stations, the heights most generally are from about 45 to 100 miles. Some authors have assigned heights as low as 5 miles, and others as high as 500 miles and even higher, but the results of recent research are not confirmatory of these

extremes. The distance of the stations at which the same aurora has been visible, indicates the enormous geographical extent, and likewise the great altitude which the phenomenon frequently attains. One aurora, for instance—that which occurred on the 25th October 1870—was seen over a large portion of the northern hemisphere, and at the same time *auroræ* were seen at many places in

when the sun is near the horizon. Other lines, however, have been seen, which cannot as yet be produced by the physicist from any known substance.

Lemström has shown by the observations and experiments he made at Sodankylä, that auroræ are due to currents of positive electricity illuminating the atmosphere in their passage to the earth.

Luminous appearances accompanied the setting in of a current towards the earth from the network of insulated wires with which he overspread the top of Mount Oratunturi, and this light was clearly auroral, giving the hitherto enigmatical

citron line of Ångström referred to above, which is the invariable constituent of auroral radiations. Other faint and indistinct lines are enumerated as present, and Lemström is of opinion that there is a tolerable agreement between some of these and the lines in the laboratory spectrum of rarefied air, but the whole subject demands further investigation.

Loomis and Fritz have severally investigated the geographical distribution of the aurora borealis. The following woodcut is from

Loomis, from which it is seen that the region of greatest auroral action is an oval-shaped zone surrounding the north pole, whose central line

Aurora Borealis.

the southern hemisphere. Dr Sophus Tromholt, who carried out a series of investigations on the subject of the aurora borealis in the extreme north of Norway, states that the light of the aurora is never serviceable to people in their work; its contribution to lighten the darkness is almost *nil*; the momentary flashes of real luminosity are very brief and of no practical value.

The noise that is alleged to accompany the aurora borealis in high latitudes would indicate for it a comparatively moderate height; but we can scarcely yet be said to be in possession of indisputable instances of its being heard by competent observers. See the subject discussed in communications to *Nature*, especially one by Tromholt in vol. xxxii. p. 499.

The intimate connection between the aurora borealis and the magnetism of the earth is shown by various facts. During the occurrence of the phenomenon, the magnetic needle appears very much disturbed, sometimes deviating several degrees from its normal position, and appearing to be most affected when the aurora is brightest; and this oscillation is frequently perceived far beyond the district where the aurora is seen. The vertex, likewise, of the luminous arch is almost always found to be in or very near the magnetic meridian, and the boreal crown has its seat in the prolongation of the freely suspended needle. There seems, moreover, to be a connection between the magnetic poles of the earth in regard to the aurora, for, as has been frequently ascertained, the meteor occurs simultaneously at both. The aurora borealis appears to be an electric discharge connected with magnetic disturbance. If one of Gassiot's vacuum tubes be brought near an electric machine, or between the poles of an induction coil, flashes of light pass between the ends, which bear a striking resemblance to the aurora borealis. A comparison of the spectra of the two goes far to establish identity.

The auroral spectral line, discovered by Ångström in 1867, is a yellow line near the sodium line, and is the same as the air line seen in the solar light

Map showing the geographical distribution of the Aurora Borealis.

crosses the meridian of Washington in latitude 56° , and the meridian of St Petersburg in latitude 71° . It follows from this that auroræ are more frequent in North America than in the same

latitudes in Europe. Loomis points out that this auroral zone bears considerable resemblance to a magnetic parallel or line everywhere perpendicular to a magnetic meridian.

It is a fact of the greatest significance that as regards geographical distribution, auroræ and thunderstorms are complementary, auroræ being not more characteristically of polar than thunderstorms are of tropical origin. Auroræ are, however, subject to extremely complicated periodicities, indicating systematic magnetic associations; whereas thunderstorms may be regarded as completely dissociated from magnetic associations, and their periodicities are restricted to diurnal and annual variations.

The diurnal maximum of auroræ in middle latitudes, or on the equatorial side of this great auroral zone, shaded dark in the woodcut, occurs in the evening; but in Greenland and other regions on its polar side, the maximum occurs in the early morning. Further outside the auroral zone, there are two maxima in the year, one in spring and one in autumn, but at places inside this zone, the two maxima coalesce into a single maximum at the winter solstice. Thus, with an increase of solar heat, diurnal or annual, the auroral zone travels equatorwards, and with increased cold polewards; and it is extremely interesting to note that on the polar side a sunspot maximum is accompanied with auroral minimum, and the equatorial side with a maximum, thus supporting the idea that a sunspot maximum period is coincident with a maximum temperature. At the times when the solar heat is greatest evaporation is greatest, the supply of atmospheric electricity consequently more copious, increased tension brings about more speedy neutralisation, the zone of gradual recomposition travels towards the equator; and thus auroræ become more frequent in middle latitudes. See the handbooks of Meteorology, numerous articles and notes by Lemström and others in *Nature* (1882-87), and Dr Sophus Tromholt's *Under the Rays of the Aurora Borealis* (1885).

Aurangabad, the name of at least four places in India. The most important of these is in the state of Hyderabad, situated on the Doodna, a tributary of the Godavary. The population is estimated at about 50,000. Its monuments of former grandeur are a palace, now in ruins, built by Aurungzebe, and the mausoleum of Aurungzebe's daughter.

Aurangzebe (*Aurangzeb*, 'Ornament of the Throne') was the most powerful of the Mogul emperors of India, the last who ruled with energy and effect. He was born in 1618, and was the third son of Shah-Jehan. He early cherished or professed profound religious zeal. In 1657 his father, who had previously promoted him to high civil and military offices in the state, in performing the duties of which he greatly distinguished himself, was seized with an illness from which he was not expected to recover. The reins of power were at once seized by his eldest son, Dara, who was unpopular with the orthodox Mohammedans, as being too liberal in his theological views. Of the brothers, Shuja was at that time governor of Bengal, Aurungzebe of the Decan, and Murad of Guzerat. The first immediately took up arms. Aurungzebe's policy was to let the two fight it out, and exhaust each other, and then to play off his third brother against the victor. He conferred with Murad; assured him he had no earthly ambition; that the crown he strove for was a spiritual, and not a temporal one; and that, for affection's sake, and with a view to promote the interests of the true faith, he would support his pretensions to the throne. Murad believed him, and the forces

of the two were joined. Meanwhile, Dara having overcome Shuja's army, directed his forces against his other two brothers; but Aurungzebe's plausibility prevailed over Dara's generals, who deserted, and Dara had to seek safety in flight. By this time, however, Shah-Jehan had somewhat recovered. Aurungzebe professed the utmost loyalty, but secretly gave his son instructions to take possession of Shah-Jehan's palace, which was done, and the aged monarch was made prisoner. Aurungzebe next seized and confined his too confiding brother, Murad; and after a struggle of two or three years' duration, Dara and Shuja also fell into his power, and all three were put to death. The sceptre was now firmly within the grasp of Aurungzebe. He professed not to care for the imperial insignia, but was ultimately induced to receive them in August 1658, assuming the title of Alemgir, 'Conqueror of the World,' and later, that of Mohi-eddin, 'the Reviver of Religion.' In the seventh year of Aurungzebe's reign, his father died, still in confinement.

Aurangzebe's long reign of half a century was distinguished by great outward prosperity, and has been represented as the most brilliant in Indian annals; but the empire was diseased at its heart. Everywhere there was distrust; the emperor, who had established his throne by fraud, was naturally enough distrusted by all. He lacked confidence in his statesmen, who, in their turn, distrusted him and one another. His sons imitated him in his disobedience to his father, and the Hindus, whom he treated with great harshness, excited the Mahrattas against him in the south. Still his great abilities sufficed during his reign not only to preserve his empire intact, but even to enlarge it considerably. Discord between the monarchs of Bijapur and Golconda enabled him to add these two kingdoms to his empire. But though some of the independent Mohammedan princes were subdued, the Hindu states were gathering strength for the overthrow of the Mogul power; and the seeds of decay which had been sown in his reign bore ample fruit in the reign of his son. The later years of Aurungzebe's life were passed in misery. He lived in constant dread that he himself would receive of the measure which he had meted out to others. The decadence of the Mogul empire dates from Aurungzebe's death, which took place at Ahmednuggur, in February 1707, in the eighty-ninth year of his age, and forty-ninth of his reign.

Auscultation (Lat. *auscultare*, 'to listen'), a mode of detecting diseases, especially those of the heart and lungs, by listening to the sounds produced in the cavity of the chest. This is done either by the unassisted ear (*immediate auscultation*), or by the aid of a simple sound-conveying instrument, the stethoscope (*mediate auscultation*). By care and attention, the normal sounds produced by respiration and the beating of the heart may be distinguished from the several abnormal sounds indicating disease. Practised by Auenbrugger in the 18th century, auscultation is classed among the most important of discoveries in modern medical science. See DIAGNOSIS, PERCUSSION, RESPIRATION, STETHOSCOPE.

Ausonius, DECIUS MAGNUS, the most conspicuous Roman poet in the 4th century, was born at Burdigala (Bordeaux), about 309 A.D. Early distinguished for his eloquence, he was appointed by Valentinian tutor to his son Gratian; and he afterwards held the offices of quæstor, prefect of Latium, and consul of Gaul (379 A.D.). On the death of Gratian, Ausonius retired from public life to his estate at Bordeaux, where he occupied himself with literature and rural pursuits until the time of his death (392). It

is most probable that Ausonius was a Christian, though the question has occasioned much controversy, and is perhaps made all the more uncertain by the impurity of his writings. His works include a collection of 150 epigrams, poems on his deceased relatives (*Parentalia*), and on his colleagues (*Commemoratio Professorum Burdigalensium*), epistles in verse and prose, and 20 so-called idyls, of which the tenth, *Mosella*, a description of a journey on the Rhine and Moselle, is perhaps the happiest of all his poems. Ausonius is but a poor poet, though he occasionally displays a certain neatness and grace of expression. The best edition is by Schenkl (Berl. 1883).

Aussee, a market-town in the Salzkammergut of Styria, at the confluence of three mountain-streams, which form the Traun, 22½ miles S.E. of Ischl by rail. Situated 2171 feet above the level of the sea, it has mineral springs and baths and pretty villas, and is visited by some 6000 strangers annually. Pop. (1880) 1369, mostly engaged in salt-boiling.

Aussig, a flourishing town in Northern Bohemia, on the left bank of the Elbe, here joined by the Biela, 66 miles NNW. of Prague by rail. It has several large factories, including the principal chemical works in Austria, and carries on an active trade in fruit, timber, stoneware, paraffin, and especially in coal. Its once strong fortifications were destroyed by the Hussites in 1426. The town-church, said to have been built in 826, possesses a Madonna by Carlo Dolce, presented by the father of Raphael Mengs, who was born here. Pop. (1880) 16,524.

Austen, JANE, one of the greater English novelists, was born December 16, 1775, at Steventon, Hampshire, of which parish her father was the rector. Here she spent the first twenty-five years of her peaceful life. She was the youngest of seven children, among whom she had but one sister, and of her brothers two ultimately rose to the rank of admiral in the navy. Her father, who used to augment a slender income by taking pupils, gave her a better education than was common for girls towards the close of the 18th century. Jane learned French and Italian, and had a good acquaintance with English literature, her favourite authors being Richardson, Johnson, Cowper, Crabbe, and, later, Scott. She sang a few old ballads with much sweetness, and was very dexterous with her needle. She grew up tall and remarkably graceful in person, with bright hazel eyes, fine features, rich colour, and beautiful brown curly hair. Her disposition was very sweet and charming, and she was an especial favourite with children, whom she used to delight with her long improvised stories. In her life there is a hint of an affection for a lover who died suddenly, but there is no trace of such a tragedy in her books, which are cheerful and wholesome throughout, free from anything morbid or bitter. In 1801 she went with her family to Bath, and after her father's death in 1805, removed to Southampton, and finally, in 1809, to Chawton near Winchester. She had written stories from her childhood, but it was here that she first gave anything to the world. Four stories were published anonymously during her lifetime—*Sense and Sensibility* in 1811, *Pride and Prejudice* in 1813, *Mansfield Park* in 1814, and *Emma* in 1816. The first two were written before the gifted authoress was more than two-and-twenty years old. Early in 1816 her health began to give way. In the May of 1817 she came for medical advice to Winchester, and here she died two months later, July 18, 1817. She was buried there in the cathedral. *Northanger Abbey* and *Persuasion* were published in 1818, when the authorship of the whole six was first

acknowledged. Jane Austen's novels are the earliest example of the so-called domestic novel in England, nor within their own limits have they been surpassed or even equalled since. No one was ever better acquainted with the limits of her own powers than this marvellous girl, and consequently all her work stands on the same high level of excellence. She speaks of the 'little bit (two inches wide) of ivory on which I work with so fine a brush as produces little effect after so much labour.' The finest critics, with singular unanimity, have praised the delicacy of her touch, and her faultless work has called forth the most unqualified admiration from Southey, Coleridge, Sydney Smith, and Lord Macanlay. Sir Walter Scott wrote of her in his diary: 'That young lady had a talent for describing the involvements, feelings, and characters of ordinary life which is to me the most wonderful I have ever met with. The big bow-wow I can do myself like any one going; but the exquisite touch, which renders commonplace things and characters interesting from the truth of the description and the sentiment, is denied to me.' Her world is the gentry in the England of her time, and she portrays its everyday life with marvellous truthfulness of insight. Her characters are perfectly distinct, and, spite of their old-fashioned dresses and quaint expressions, are more alive to us than many of the persons among whom we actually live. See her Memoir, by her nephew, J. E. Austen Leigh (2d ed. 1871); and her Letters to her sister, written from 1796 to 1816, edited by Lord Brabourne (1884); also Miss Thackeray's fine study in her *Book of Sibyls* (1883).

Austerlitz (Czech *Slavkov*), a small town in Moravia, about 12 miles ESE. of Brunn, stands on the Littawa, and has a population of 3500. Here, on 2d December 1805, Napoleon defeated the combined forces of Russia and Austria, under the command of their respective emperors. The French amounted to 70,000 men; the allied armies to 95,000. In this disastrous battle—known as the 'battle of the three emperors'—the Russians lost 21,000 in killed, wounded, and prisoners, the Austrians 6000, and the French 6800.

Austin, the capital of Texas, U.S., stands on the left bank of the Colorado River, and at the junction of several railroads, 166 miles W. by N. of Houston. The river here breaks through a range of hills upon which the city is built. Austin is the seat of a new State Capitol (1887), for the expenses of which three million acres of land have been appropriated, and contains churches for the various denominations, four banks, the State University, which is largely endowed with land grants, and furnishes free tuition to students; several academies, and state asylums for the insane, blind, and deaf and dumb. The city was named after Stephen F. Austin (q.v.). Pop. (1870) 4428; (1880) 11,013; and at the census of 1890, 14,476.

Austin, ALFRED, journalist and poet, born of Catholic parents at Headingley near Leeds, May 30, 1835. He was educated at Stoneyhurst and St Mary's College, Oscott, graduated at the university of London in 1853, and was called to the bar in 1857. He soon turned to literature for a living. His first work was *Randolph* (1854), an anonymous poem full of sympathy for the Poles; but his first important book was *The Season: a Satire* (1861), which was so severely criticised, that its author felt it necessary to reply in *My Satire and its Censors* (1861). *The Human Tragedy* (1862) he soon recalled, but did not issue it in its altered form till 1876. Later volumes of verse are *Interludes* (1862); *Savonarola*, a tragedy (1881); *Solilo-*

quies in Song (1882); and *At the Gate of the Convent* (1885). As a journalist Austin has long been connected with the *Standard* and *Quarterly Review*, and acted since 1883 as editor of the *National Review*. He stood twice for parliament without success, and has written several political pamphlets, one a brave attempt to answer Mr Gladstone's *Bulgarian Horrors*.

Austin, JOHN, a distinguished writer on jurisprudence, was born at Creting Mill, Suffolk, March 3, 1790. At the age of sixteen he entered the army, and served in Sicily; but he sold his commission after the peace, and in 1818 was called to the bar. In 1820 he married Miss Sarah Taylor of Norwich (see below), and went to live in Westminster, beside Jeremy Bentham and James Mill. He was compelled by bad health to abandon his practice at the bar about the time when the university of London was founded (1826), and he then received the appointment of professor of Jurisprudence. To fit himself for the chair, he settled in 1827 at Bonn, and returned to England next year well acquainted with the writings of some of the most eminent of the continental jurists. His lectures were well received by a few distinguished men; but the subject was not recognised as a necessary branch of legal study. In the absence of students, Austin in 1832 was reluctantly compelled to resign his appointment. In the same year, he published his *Province of Jurisprudence Determined*, a work at the time little appreciated by the general public; in the estimation of competent judges, however, it placed its author in the highest rank among writers on jurisprudence. It dealt with the relations of ethics to law, and gave an admirable statement of utilitarianism, on which he based his system of morals. In 1833 he was appointed by Lord Brougham a member of the Criminal Law Commission. The post was not much to his taste, as he did not believe that the public received any advantage from such bodies. 'If they would give me £200 a year,' he said, 'for two years, I would shut myself up in a garret, and at the end of that time I would produce a complete map of the whole field of crime, and a draft of a criminal code.' Austin was afterwards appointed a member of a commission to inquire into the grievances of the Maltese. He returned to England in 1838, not in good health, and soon removed with his family to Germany, living at Carlsbad in summer, at Dresden and Berlin in winter. The revolution of 1848 drove him back to England, and he then settled at Weybridge, where he died in December 1859, universally respected for the dignity and magnanimity of his character. His lectures on the principles of jurisprudence were prepared for the press by his widow, and published after his death under the title of *Lectures on Jurisprudence* (1861-63). They and the earlier works, edited together by Mr R. Campbell, have passed through several editions.

Austin's great merit consists in his having been the first English writer who attached precise and intelligible meaning to the terms which denote the leading conceptions underlying all systems of jurisprudence. With a very perfect knowledge of the methods of Roman and English law, he displayed genius of the highest order in devising a novel system of classification for the subject-matter of his science. The work he did is incomplete, but it forms a sure foundation to future labourers in the same field. It is universally recognised as an enduring monument of learning and genius, and it entitles its author to take rank as one of the very few Englishmen who have made contributions of importance to the philosophical study of law. Austin said of himself that his

special vocation was that of 'untying knots'—intellectual knots; and so it was. He set himself to the task of exposing the errors hid under the phrases and metaphors current among writers on law, and this he accomplished with such skill and subtlety as to make his works models of close and sound reasoning. See *Memoir of Austin* prefixed to the *Lectures*, and an article on Austin in Mill's *Dissertations*.—Mrs AUSTIN (née Sarah Taylor), translator, was born at Norwich in 1793, and married John Austin in 1820, the only child of the marriage being Lady Duff Gordon (q.v.) A faithful and devoted wife, she spent many years with her husband abroad, and enjoyed the friendship of many of the most eminent persons in continental society. Mrs Austin translated from the German, Falk's *Characteristics of Goethe* (1833), Carové's *Story without an End* (1834), Ranke's *Popes* (1840) and *History of the Reformation in Germany* (1845); from the French, M. Cousin's *Report on Public Education in Prussia* (1834), and Guizot's *English Revolution* (1850). She herself was author of a pamphlet *On National Education* (1839); of *Germany from 1760 to 1814* (1854); and of *Letters on Girls' Schools and on the Training of Working-women* (1857). From 1861 to 1863 she was engaged in editing her husband's lectures from his manuscripts, a duty she discharged with very great ability. She died at Weybridge, 8th August 1867.—CHARLES AUSTIN, younger brother of John, was born in 1799, and educated at Bury and Jesus College, Cambridge. Called to the bar in 1827, and made a Queen's Counsel in 1841, he, during the railway mania, made an enormous fortune as a parliamentary lawyer, and in 1848 retired from practice. So this first of lawyers and most eloquent of Benthamites, Macaulay's rival as a conversationalist, who to Mill had seemed 'capable of dominating the world,' died, a country squire, at Brandeston Hall, in Suffolk, 21st December 1874.

Austin, STEPHEN F., founder of the State of Texas, was the son of Moses Austin, a pioneer in the same region, and in 1821 conducted a party of settlers to where the city of Austin now stands, thus carrying out a work his father had begun (see TEXAS). In 1833 Austin went to the city of Mexico to secure the admission of his settlement into the Mexican Confederacy, and was imprisoned there till 1835. He died in December 1836.

Austin Friars. See AUGUSTINIANS.

Australasia is a term etymologically equal to *Southern Asia*, but used to indicate Australia and the adjoining islands—Tasmania, New Zealand, Papua or New Guinea, New Caledonia, the New Hebrides, New Ireland, and New Britain. The term would thus exclude the Malay Archipelago, Micronesia and Polynesia proper; but some authors include these great groups of islands also, making the name therefore equivalent to *Oceania*. Popularly, on the other hand, it means the 'Australian Colonies' of Great Britain, including Tasmania, New Zealand, Fiji, &c. The several islands will be found discussed each under its own name; and for the fauna and flora of this region, see GEOGRAPHICAL DISTRIBUTION OF PLANTS AND ANIMALS.

Australia, by far the largest island on the earth's surface, and for extent describable as a continent, lies between 10° 39' and 39° 11½' S. lat., and between 113° 5' and 153° 16' E. long.; having a maximum length, from west to east (from Dirk Hartog Island to Point Arkwright), of about 2400 miles; and a maximum breadth, from north to south (from Cape York to Wilson's Promontory), of 1971 miles; making a total area of 2,954,417 sq. m. (excluding Tasmania, 26,215), about one-fourth less than that of Europe, or nearly twenty-five

times that of Great Britain and Ireland. Its nearest distance to England is about 11,000 miles. It is separated from New Guinea by Torres Strait, 90 miles broad, and from Tasmania by Bass Strait, 140 miles wide; on the N.W., W., and S., it is washed by the Indian Ocean; and on the E., by the South Pacific.

The name Australia in its present signification, was first suggested by Captain Flinders, and adopted by the colony about 1817; but the word was used in *Purchas his Pilgrimes* (1625) and other old works for the unknown southern continent.

This island-continent is, above all other continents, exceedingly compact, with an almost unbroken outline on the east and west. Parallel with the east coast, at a distance of about 60 miles, stretches for 1200 miles the Great Barrier Reef, offering but one safe opening for ships. The sea encircling Australia is, on the whole, comparatively shallow. At a distance of from 300 to 500 miles, however, on the east, south, and west coast, a depth of 15,000 feet is attained.

The absence of rivers communicating between the coast and the interior is remarkable. The mountains rising to any great elevation are all on the east side; and there is but one great river, the Murray, collecting into itself (by the Darling and other great tributaries) almost the whole western drainage of that eastern range. The few mountains on the west side of the continent feed but a few short intermittent streams, and a large expanse, between a narrow strip of occupied country on the west coast and the overland telegraph line, appears to be but a slightly relieved barren desert. The lack of natural irrigation over this arid area is further aggravated by the enormous evaporation, which for long periods dries up such rivers as it possesses.

Physical Features.—The mountains of Victoria are noticed in the description of its geology. The eastern highlands of Australia, running parallel with the coast for some 1700 miles, now in a series of ranges, and now in a single chain or series of detached hills, are continued into New South Wales by the Warragong, or Australian Alps, where in Mount Kosciusko (7308 feet) the continent attains its highest elevation. Thence upland valleys merge northward into the Blue Mountains, which, again, send offshoots towards the Liverpool Range, that, sweeping east and west, curve round the southern edge of the Liverpool Plains. The main chain skirting the east of New England, runs north to the frontiers of Queensland, where it branches into an eastern arm, the Macpherson Range; and a western arm, the Herries Range. Inclosing the western valley of the Brisbane River, and sinking northward to the valley of the Burnett, is the Dividing Range of Queensland, from whose west side slope the Darling Downs. To the north of the Brisbane and Condamine rivers, the highlands expand to their greatest breadth, but contract again to the north of the Fitzroy River into a comparatively narrow chain, which sinks into the depression of the valley of the Burdekin. North of this river, uplands, with an average elevation of 2500 feet, again start north, terminating at 17° S. lat. In South Australia, the Mount Lofty Range skirts the east of St Vincent Gulf, and the Flinders Range the east of Spencer Gulf and Lake Torrens.

Almost the whole of this vast region in the SE. of Australia (the eastern part of South Australia, Victoria, New South Wales, and Queensland) is drained by the Murray and its tributaries, whose arterial system has an area of about half a million miles, an area twice as large as the Austrian empire. The Murray, rising in the Australian Alps, flows between Victoria and New South Wales, then

through South Australia, discharging, after a course of 2345 miles from the source of the Darling, one of its principal tributaries, into Encounter Bay, in the Indian Ocean, shortly after passing through Lake Alexandrina. On its southern or left bank, it receives all the northern streams from the mountains of Victoria, the principal of which are the Goulburn and Loddon. On its northern or right bank, it absorbs all the south-western rivers from the eastern highlands, the principal being the Murrumbidgee (1350 miles long), which also rises in the Australian Alps and collects the waters of the Lachlan; and farther west, the Darling (1160 miles), which has for its tributaries the Barwan, Culgoa, and Warrego. North of the Murray, the two most important rivers are the Fitzroy and the Burdekin in Queensland. The other rivers to the east of the eastern highlands are short and rapid, unfit for navigation. All those hilly and partially river lands consist of grassy park-like uplands, clothed with scattered thin forests of magnificent trees, for the most part evergreen and vertical-leaved, diversified by bush and heath and scrub; all of excellent pasture, intersected by wide valleys of remarkable fertility well adapted for agriculture.

From the head of the Gulf of Carpentaria stretches a tableland westward along the border of the Gulf and the base of Arnhem Land, then SW. along the coast, pierced by the Flinders River, the deep valley of the Alligator, the Roper, and the Victoria; the latter two navigable for a considerable length, and flowing through fertile lands and picturesque scenery.

Western Australia, towards the coast, is in its northern half crossed by ranges of detached mountains, running mostly east and west, and intersected by the fertile valleys of Ashburton, Gascoyne, and Upper Murchison. A large part of its interior consists of a barren tract of salt or mud steppes, almost destitute of fresh water, and extensively overgrown with dreary thickets. In the south, it is pierced by the Upper Swan River and the Blackwood. On the south coast, from King George's Sound to Spencer Gulf, is neither mountain nor river.

To the north of Spencer Gulf is an area of some 1000 sq. m., set with lakes, 'the Lake District' of Australia; Torrens, straight to the north of Spencer Gulf, over 100 miles long, with Eyre to the north of it and much larger, and Gairdner to the west of it. To the east of Eyre are Lakes Blanche and Gregory; and far to the NW., Lake Amadeus. These dead masses of salt water fluctuate greatly in body as the season is dry or rainy, now sheets of water, and now almost grassy plains, set in the dreariest wide-spreading steppes. A comparatively verdant belt of country lies to the east of this district, and runs to the extreme north, as the axis of Australia, along the telegraph line.

Geology.—So far as is known, Australia would seem to be built up chiefly of Palæozoic and Cainozoic or Tertiary formations, though Mesozoic or Secondary deposits have of late also been laid open in various quarters. In Victoria, the Grampians and Pyrenees (with the Ballarat gold-fields to the south) in the SW., the great Dividing Range, and in the NE. the Warragong or Australian Alps; in New South Wales, the Blue Mountains; and in Queensland, the Dividing Range, all consist principally of Silurian strata, broken in upon, however, by intrusive granite, syenite, &c. The same Silurian formation largely pervades South Australia, running in a broad diagonal from the SE. coast, north-westward across the whole province. Though igneous rocks occupy a large area to the south and west of Western Australia, traces of Palæozoic

formations are to be found in the Darling Range. No Carboniferous rocks are known in South and Western Australia. Detached patches of metamorphic rocks occur in Queensland, along the central line of the continent from Ashburton to the Macdonnell Ranges, and in the NW. of Arnhem Land. The older settlements of New South Wales, including the coal-field of the Hunter River, rest on sandstone. Fossiliferous Carboniferous strata, abounding in fine coal, extend over 50,000 sq. m. of Queensland, between 29° and 15° S. lat. The tin-mines of Queensland occur in granite, rising through the Carboniferous rocks. Sandstone and limestone, of Carboniferous or Permian formation, are found in the SE. of Victoria; and the two southern peninsulas of this province consist largely of limestone and carbonaceous deposits of Mesozoic age. The Secondary formations lie principally, however, in Queensland, where Cretaceous beds extend for about 200,000 sq. m., from near the Gulf of Carpentaria to the south of the Darling River. The valley of the Wannon (which runs into the Glenelg River) consists of Mesozoic strata, while the coal deposit of Parramatta to the north of Sydney is likewise of Mesozoic age. The Clarence River, to the north of New South Wales, runs through Triassic strata.

Tertiary deposits, mostly Pliocene, it is supposed, occupy an immense area of Australia, comprehending the desert sandstone, the coral limestone, and a large part of the conglomerates and clays of the gold-diggings. In Western Australia, to the east of the region of igneous rocks, the surface is occupied by desert sandstone, which also stretches north and eastward far into the interior, taking in likewise all South Australia outside the diagonal Silurian bed above mentioned, penetrating into the interior plains of Victoria and New South Wales, and skirting the eastern edge of the Cretaceous strata of Queensland. The earliest discoveries of gold in Australia were made in recent and Tertiary alluvia. The older auriferous drifts are believed to be of Tertiary age. These drifts are found filling up old valleys, and covering the low grounds that spread out from the base of the mountains. They appear to be all of fresh-water origin; vegetable remains (trees, fruits, &c.) occurring not unfrequently in the various beds. During their accumulation volcanic action was rife, and sheets of lava were poured over the surface at successive intervals, so that in sinking shafts through these 'drifts,' the miner sometimes penetrates three or even four separate beds of lava. The gold is usually met with at the very base of the drifts, in the 'gutters' or 'leads,' which are just the bottoms of the old filled-up valleys. It may be added, that although gold is still obtained from such 'drifts,' yet the chief supply now comes from quartz-veins.

Quaternary deposits, forming 'flats' in the gold districts, occur in the Upper Macquarie and Upper Murrumbidgee rivers. These, with clay-deposits in the Liverpool Plains and Darling Downs of New South Wales, have yielded some very interesting fossils throwing light on the past fauna of Australia. A kangaroo, for example, has been found very much larger than any kangaroo of the present times (see *DIPROTODON*); also, a *nototherium* (an animal between the wombat and kangaroo) as large as a rhinoceros. Remains have also been discovered of a bird, named by Professor Owen *dromæornis*, larger than an ostrich, kindred to the now existing emu and cassowary.

Though there are no active, yet numerous extinct volcanoes are to be found in Australia. In South Australia, in the Gambier group, is a large series of them, which have broken through the horizontal coral beds, and whose craters now present beautiful lakes. In Victoria, a large part of the soil is

volcanic, the debris of volcanoes of all periods down to the Tertiary. Looking from any high eminence in the neighbourhood of Ballarat, you may count extinct volcanoes by the score, some nearly closed up; but others having rims of some miles in circumference, from a few to a hundred feet deep, some rising to a height of 2000 feet above the sea.

Minerals.—Gold is distributed more or less through all the Australian colonies, but its principal seats are in Victoria, Queensland, and New South Wales. Diamonds and other precious stones have also been found in different parts of the continent. The Carboniferous strata of New South Wales, extending over a vast area, are very rich in coal, the coal-fields of that colony being among the most extensive in the world, containing also cannell-coal and mineral oils. The whole basin of the Hunter River, with its tributaries, down to Newcastle on the seacoast, abounds in true coal of Palæozoic age. Coal is found also at Cape Otway, and Western Port in Victoria, but belongs to the Mesozoic formation, and is not of great value. In the south of Queensland is an oolitic coal-field. Palæozoic coal, of great extent and great prospective value, has been discovered in the central regions of that colony, along the basins of the Mackenzie and Dawson rivers; while near Brisbane and the upper courses of the Darling Downs rivers, almost equally extensive and valuable beds of coal of Mesozoic age have been found. Rich copper-mines have been opened in the Palæozoic limestones of South Australia. The most important of the earlier mines was the Burra-Burra, 90 miles to the north of Adelaide, discovered 1845; after paying handsome dividends for many years, it has, however, been worked out. Still more extensive deposits of copper ore lie at Wallaroo and Moonta, at the northern end of York Peninsula. Many other copper-mines have been opened in South Australia, but consequent on the serious fall in the price of copper, operations have been suspended in most cases. Silver ore (principally argentite) is worked at Boorook, New South Wales, and mines of apparently inexhaustible wealth were discovered in 1884 at Silverton in the Barrier Ranges. Silver-lead has been worked near Cape Jervis (southern point of peninsula west of Alexandrina Lake), and bismuth in the mountains of the Mount Lofty Range to the east of Adelaide. Lead and copper exist largely in Western Australia, particularly in the northern districts; but only 465 tons of lead ore, and 120 tons of copper ore were exported in 1885. Iron exists in large masses in Western and South Australia, but in neither of these colonies has coal been found to work it. Very valuable tin-mines have been opened in Queensland, especially in the neighbourhood of the Wild River, as also to the north of New South Wales. Ores of antimony have also been worked in Victoria and New South Wales, and are known to occur in South Australia.

Mining.—Mining is a great and growing industry of Australia, though gold-mining has for some years been steadily declining. Gold is distributed more or less through all the colonies, but the chief mines hitherto opened are in Victoria, where are seven mining districts: Ballarat, Sandhurst, Maryborough, Beechworth, Castlemaine, Ararat, and Gipps Land; the first three being the most productive. The principal gold districts of Queensland are the Peak Downs, Gympie, and Charters Towers. These gold-fields employ a large number of Chinese. The total yield of gold in Australia from 1851 to 1885 was 68,406,511 ounces, valued at £267,991,293. In 1885 the yield of gold was 1,191,135 ounces, valued at £4,195,529. There are extensive coal-fields in New South Wales and

Queensland; the produce in 1885 was 3,088,561 tons. South Australia is known for its rich copper-mines, and there are productive gold-mines in its Northern Territory. Tin-mines of great value have been opened up in Queensland, and silver-mines in New South Wales.

Climate.—In proportion to its size, Australia, lying mostly within the temperate zone, enjoys on the whole an equable climate, although subject to great occasional irregularities; in general, hot and dry, and remarkably salubrious. Within the tropics, it has its rainy season in summer (November to April); south of the tropics, almost exclusively in winter. The principal mountains, both for extent and height, lying to the east or windward side, receive by far the heaviest tribute of moisture brought by the winds from the Pacific; and, as a rule, the amount of rainfall on the east side is in inverse proportion to the distance from the east coast. The west side has far less rain than the east, and there the rainfall is proportionate to the proximity to the west coast. Thus, Sydney appropriates a mean of some 50 inches rain in a year, while Bathurst, 96 miles from the sea, gets only 23 inches; Deniliquin (287 miles removed) 20 inches, and Wentworth (476 miles) but 14 inches. Melbourne and Adelaide in the south receive respectively 25 and 20 inches. The Queensland coast takes from 40 to 80 inches; the west getting proportionately less. The elevated lands of West Australia enjoy about 30 inches rainfall. What moisture is left in the winds after their passage across the highlands, the intense heat rising from the central plains tends to dissipate, instead of allowing it to condense into rain. The parched traveller over those arid deserts looks up again and again into gathering clouds which argue possibility of rain, but never do come to rain. South Australia, Victoria, and in a less degree, New South Wales, are exposed to hot winds from the interior which rapidly raise the temperature of the lands they visit to 115° or higher, and are followed by an equally sudden fall. Melbourne has a mean temperature of 58°; Sydney, 63°; Adelaide, a little higher; Perth, about the same as at Sydney. Captain Sturt found the mean temperature of the interior for three months over 101° F. in the shade, and the drought such as to loosen the screws of his boxes, split his combs into thin laminæ, make the leads drop out of his pencils, and his finger-nails become brittle as glass; the season was, however, an exceptional one, and good pastoral country exists within a short distance of what he described as the 'Stony Desert.' The east highlands have a greater proportion of snow than their latitude and height would argue. At 5000 feet of altitude, in certain situations, snow lies all the year round, and many of the higher mountains are covered with snow all the winter. One fall, and one only, of snow is chronicled at Sydney, on 28th June 1836.

The worst feature in the climate of Australia is the total uncertainty and inequality of the rainfall in all parts of the continent, menacing the whole country with almost equally distressing alternations of drought and flood. Droughts sometimes completely wither up vegetation over large tracts of land, to the destruction of many thousands of cattle; that of 1884 was said to have destroyed 10,000,000 sheep. On the coast of New South Wales hardly any rain fell in 1814 and 1815, or in the years 1827, 1828, and 1829. The ordinary drought itself renders almost all the rivers of Australia, with the exception of the Murray proper, merely intermittent; shrunk for months together into straggling water-holes, with or without some connecting thread of stream. As rivers, they really cease to exist for a

longer or shorter period every year. Even the Murray is only navigable at certain seasons of the year. The rainy season, on the other hand, swells these pools into terrific floods, inundating the country, and often most seriously destroying property. The caprices of Australian drought and flood are well illustrated by the metamorphoses of Lake George, 25 miles to the SW. of Goulburn, and having an elevation of 2260 feet above the sea. In 1824 Lake George was a sheet of water 20 miles long by 8 miles broad; in 1837, a grassy plain; in 1865 it was 17 feet deep; in 1867, two feet deep; in 1876, 20 miles long and 20 feet deep. If only the weather could, within any approximate degree, be calculated on, there are, no doubt, many tracts in the interior which could be utilised. Attention is, however, being directed to irrigation-works on an extensive scale, and the governments of Victoria and South Australia are making arrangements to utilise the waste waters of the River Murray. Water for the use of stock in summer is extensively stored in dams, and large tracts of country with no surface-water have been made available for settlement by sinking wells. In some districts where the conformation is favourable, artesian wells have proved a success.

Botany.—The vegetation of Australia is altogether unique, standing at a long interval from that of all other quarters of the globe; but it is exceedingly abundant in species. These, it is calculated, number about 10,000, of which 8000 have been already determined; considerably more than are to be found in all Europe. A peculiarity of the trees covering its seaboard highlands, is their uniform sombre olive shade, alike on upper and under surface; and the generally vertical direction of their foliage, which thus allows much freer entrance to the blazing summer sun. Another peculiarity of Australian vegetation is the 'scrub'—the 'mallee,' 'mulga,' &c.—which presents anything but a cheering prospect, with perhaps hardly one tree within visible distance, and scarcely a bird to be descried overhead in flight. There is, however, one agreeable scrub formed by the tea-tree, a flowering shrub, a species of *Melaleuca*, abounding in almost all parts of Australia; not so dense as the 'mallee,' and mingled with other flowering plants. Next is the 'heath,' composed of a dwarf shrub, about two feet high, clothing tracts boggy in winter and dusty in summer, mingled with bushes of *Melaleuca* and *Banksia* (or 'native honeysuckle'), all bright coloured and aromatic.

The highlands are rich in wood, such as that of the gum-trees of the genus *Eucalyptus*, growing to a height of 250 feet, with a girth of 12 to 20 feet. In the Dandenong Range, 40 miles east of Melbourne, are many trees over 420 feet high; one felled giant measuring as much as 480 feet. Then in the south and west, and even a little into the interior, though less abundantly there, are the valuable shea-oaks, beef-woods, or *Casuarinas*—leafless trees, with rigid drooping branchlets something like our 'horsetails,' their wood of the colour of beef (whence the name), and as good as our oak. The jarrah, or Swan River mahogany of Western Australia, is invaluable for railway sleepers or piles, as it resists the ravages of white ants and marine insects. The grass-tree (*Xanthorrhæa*) shoots up into a rugged stem, varying in height from 2 to 10 feet, and is surmounted by a tuft of wire-like drooping foliage, from the centre of which rises a spike like a bulrush, flowering in winter into white stars. The 'wattles' or acacias, abounding everywhere in the country, and comprising over 300 species, are also a most characteristic feature of Australia, with lovely yellow blossoms,

and generally fragrant. The Australian bush is fragrant all the year. The traveller in the high-lands, especially of New South Wales, will not unfrequently light, in some sheltered valley or deep ravine, on a scene of the most luxuriant vegetation, such as that of Illawarra, 50 miles to the south of Sydney, where palms rising to 70 or even 100 feet, Indian figs draped with strange parasites, creepers, ferns, stag-ferns, 'flame-trees,' and vines, and the loftiest trees, are all intermingled into a labyrinth of the most graceful forms and brilliant colours. The 'flame-tree,' with its clusters of red flowers, gives signal of the Illawarra Mountains to ships miles out at sea. The 'fire-tree' of Western Australia, the only non-parasitical plant of the same order as our mistletoe, blazes with orange-coloured blossoms like a tree on fire. The *Stenocarpus Cunninghamii* of Queensland presents one mass 50 feet high of orange-tipped crimson stamens. The 'warratah' of New South Wales shows a single stem of 6 feet supporting a crimson blossom, like a full-grown peony. The alpine vegetation, again, of the higher mountains in Victoria and New South Wales, intermingles the *Ranunculus*, *Geum*, *Gentiana*, *Gaultheria*, &c., analogous to the alpine plants of Europe, with the purely Australian *Oxylobium*, *Brachycome*, *Acacia*, *Hovea*, and *Bossiaea*. Australia affords so wide a variety of climate and soil that most European trees and plants have been successfully introduced. The Scotch thistle has become a serious nuisance, and the governments of the various colonies, as well as private individuals, have expended large sums in the endeavour to exterminate it.

Zoology.—The zoology of Australia is even more peculiar than its botany. The mammalia of other lands are totally wanting here, while the marsupials or pouch-bearing mammalia of Australia have but the opossums of America to represent them in any other part of the world. There are in Australia 'no apes, no oxen, antelopes, or deer; no elephants, rhinoceroses, or pigs; no cats, wolves, or bears; none even of the smaller civets or weasels; no hedgehogs or shrews; no hares, squirrels, porcupine, or dormice;' only some peculiar species of rats and mice, and the 'dingo,' a wild dog. The largest of the marsupials is the kangaroo, attaining a height of 5 feet, and a weight of 200 lb. Smaller species are the wallaby, the hare kangaroo, and rat kangaroo. The fruit-eating bat, or flying-fox, is found in New South Wales and Queensland. The shores of Australia are frequented by antarctic-like seals and sea-lions; and on the coast of Queensland is the dugong or sea-cow. Then there are phalangians—nocturnal animals, feeding on leaves, and living in the hollows of trees. In the moonlight stillness of the forest, flying-opossums may be seen gliding through the air. The flying-mouse, 'able to sleep in a good-sized pill-box,' is decidedly Australian. The tarsipes of Western Australia is a honey-sucker, no larger than a mouse, with extensile tongue. The koala of the eastern districts is 2 feet long, thick-limbed, and tailless. The wombat, the largest of the marsupials, next to the kangaroo, is 3 feet long, feeds on roots and grass, burrowing deep in the ground, and is nocturnal. The 'native cats' are carnivorous marsupials, variously marked and spotted, but fierce and intractable, dwelling among rocks and in holes, and feeding on small mammals and birds. The ant-eater of Western Australia is of the size of a squirrel, beautifully white-striped, with long and rather bushy tail. It has fifty-two teeth, a greater number than in any known quadruped, and feeds on ants. The platypus, having no teeth nor marsupial pouch, and inhabiting the rivers and lagoons of the south and east of Australia, is 20 inches long, having very short legs, and broad webbed feet.

From its flat head project two flat horny jaws, like the bill of a duck. Australia favours the acclimatisation of animal as well as plant life, and the rabbit has proved so prolific as to require special legislation for its suppression. It is estimated that in New South Wales alone 2000 men are employed in the destruction of this rodent, which, if left to itself, desolates wide tracts of country by consuming the herbage. The Victorian legislature has voted £106,302 for rabbit extirpation since 1879, and the total damage sustained by the colony during the ten years 1877-86 is estimated at three millions sterling. The camel has done excellent service in the work of exploration, and is used in outlying districts not only as a beast of burden but for draught purposes. See MARSUPIALS, KANGAROO, ECHIDNA, ORNITHORHYNCHUS, &c.

The birds, if not quite so unique and strange a feature of Australia as are its mammalia, excel those of all other temperate lands for beauty of plumage and fineness of form. Passing over the splendid parrots and cockatoos, we note for their singularity of figure or brilliancy of feather, the regent-bird, rifle-bird, fly-catcher, and lyre-bird. The abundant flora, conjoined with scarcity of fruit, in this isolated continent, develops flower-feeding birds wanting in other lands, such as the Meliphagidæ or honey-suckers, and the Trichoglossidæ or brush-tongued lories. Peculiar to Australia are, too, the Megapodiidæ or brush-turkeys, the Menuridæ or lyre-birds, and the Atrichidæ or scrub-birds. The Megapodiidæ do not sit on their eggs, but bury them under mounds of earth or vegetable matter, to be hatched by the sun or fermentation. The emu and cassowary of Australia correspond with the ostrich of Asia and Africa. The Podargi, of enormous mouth—'more-porks,' as they are called, from their singular cry—are a strange and unsightly Australian type. Among song-birds are the piping-crow or musical magpie, and the lyre-bird, with its mocking notes. Noteworthy for their curious habits are the satin-birds or bower-birds, which build their domiciles of twigs and branches, decorated with coloured feathers, bones, and shells, sometimes several feet long, arched over at the top, and which are made the rendezvous of many birds of both sexes. Altogether, Australia has 650 distinct species of birds to muster against Europe's 500. Of reptiles, Australia has no less than 140 different kinds, its largest lizard measuring from 4 to 6 feet. Nor does Australia want for snakes. Though destitute of both the vipers and pit-vipers, it makes up for this by the Elapidæ (a family including the Indian cobras), constituting two-thirds of the snakes of Australia, all poisonous, though only five kinds are fatally so. The black snake of Australia measures from 5 to 8 feet long. Australia abounds, moreover, in insects, beautiful and peculiar, though the butterfly is rare in the temperate zone, becoming numerous towards the tropics. English singing and game birds have been largely introduced. The common sparrow has multiplied to such an extent that it has become a pest, and government has paid considerable sums for the destruction of these birds and their eggs. The ostrich has been successfully acclimatised, and its feathers have already become an article of export.

Aborigines.—Almost as much as its botany and zoology, the human natives of Australia are isolated and peculiar, separated by a wide remove from the Papuans, the Malays, and the Negroes. Of a dark coffee-brown complexion, rather than actually black, the Australian stands not much short of the average European in height, but is altogether of much slimmer and feebler build; his legs, in particular, are very lean and destitute of calves (a defect common to dark races). His head

is long and narrow, with a low brow prominent just above the eyes, but receding thence in a very marked degree. The nose, proceeding from a narrow base, broadens outwardly to a somewhat squat end, the eyes on either side of its thin root appearing drawn together. The face bulges into high cheek-bones. The mouth is big and uncouth, the jawbone contracted, the upper jaw projecting over the lower, but with fine white teeth, the chin cut away. The whole head and face, and indeed, the whole person, is covered with a profusion of hair, which, when freed of its usually enclogging oil and dirt, is soft and glossy. His ears are rather pricked forward. The effluvium of his skin, offensive in itself, is exaggerated by the fish-oil he uses to anoint his person. The intellect of the Australian, directed almost exclusively to the means of procuring food, operates wholly within the range of the rudest bodily senses; but inside that elementary sphere, displays no little nimbleness and skill. He is unsurpassed in tracking and running down his prey; and his weapons, though of the most primitive kind, are well adapted to assist him in that purpose, whilst his rude culinary and domestic apparatus manifests equal skill. Nay, he has some exuberance of rude sense, some imitative facility or elementary art in him, as may be observed in the crude figures of sharks, lizards, &c. carved on caves in the N.E., and on the rocks of New South Wales; as also in his language, which, within its very circumscribed sensuous sphere, is fairly expressive and complete; and likewise in the facility with which he learns to chatter foreign languages.

Outside this circle, however, all is blank to the Australian. He has no architecture, almost no weaving, no pottery, and may almost be said to have no religion. His sensations have hardly, if at all, reached the length of sentiments, far less sentimentalities. The man lords it over the woman, who is as much his property as is his 'boomerang' or 'dingo.' The male offspring is, indeed, in considerable estimation; and a father will lament the death of his son for months, or even years. Old men and old or infirm women, on the other hand, are mercilessly abandoned. In summer, they roam about naked, and sense of shame seems almost wholly undeveloped in them. Morality is entirely reduced to the notion of property, wives being one item in a man's chattels, the stealing of which has a definite punishment attached to it. Yet the 'black fellows' are capable of loyal affection and gratitude, and the noble hospitality of the wretched tribes of Cooper's Creek—famished themselves—to the last survivor of Burke's unfortunate expedition should never be forgotten. Without doubt they have often murdered Europeans, but in many cases this was but more or less legitimate reprisal for prior atrocities committed by the convicts or other reckless Europeans. Where caves abound, some of the tribes seek no further, but live in those ready-made tenements. None of them have fixed habitations; at best, only a screen of twigs and bushes, covered with foliage or turf; sometimes, however, logs of wood and turf to serve for a few days' or weeks' shelter, till the pursuit of food calls them elsewhere. Thrift is unknown, and the life of the Australian alternates between satiety and semi-starvation. In summer he goes naked; in winter he wraps himself in kangaroo skins. To hold his dowsak or digging-stick, he binds a girdle of hair about his loins; and for protection against scrubs, he hangs an apron of skins to the girdle. By way of food, he devours the kangaroo, emu, opossum, wombat, lizards, snakes (of which the head is rejected), frogs, larvae, white ants, moths, which are usually roasted, fire being produced by rubbing to-

gether two pieces of stick. The 'gin' wife is bound to keep her lord in vegetable food; roots of wild yam, seeds of acacia, sophora, leaves of the grass-tree, &c.; and if she fail to produce enough, she is liberally treated to maulings and spearings, so that a wife generally appears bruised and gashed all over. The Boomerang (q.v.) is a flat stick three feet long, curved at the centre, and which, when thrown, jerks in zigzag, spiral, or circular fashion, usually returning to the thrower. In addition, they have the throwing-stick, flint-pointed spears, shields, stone-hatchets, digging-sticks, netting-needles, nets of sinews, fibres, or hair, water-skins, and canoes.

There is no government among this people outside that of the family, and no laws except traditional rules about property. In the way of religion they have little save their terror of ghosts and demons, and some superstitious traditional rites applicable to certain epochs in a man's life, more particularly at his burial. At ten years of age a boy is covered with blood; at twelve to fourteen he is circumcised (in the south or north, not in the west or on the Murray); and at twenty he is tattooed or scarred. Felicity after death depends upon proper burial. A man dying in battle, or rotting in the field, becomes an evil spirit. For their curious exogamous marriage customs, see MARRIAGE. Their language is wholly sensuous, their abstraction tending only in the way of arithmetic as far as the number 5, and that itself quite an unusual stretch; it is of polysyllabic formation, and, the accent falling on the penultimate, is not inharmonious. The wider relations of the languages of Australia are still very obscure, but the results already obtained show that there exists between themselves a general grammatical resemblance. The chief languages, besides those spoken on the banks of Lake Macquarie and the Hunter River, are: those of the western regions; that of Encounter Bay, and that of the environs of Adelaide; the Viradurei, in the Wellington Valley; the Kamilaroi, in the plain of Liverpool, and on the banks of the rivers Kamoi, Barwan, Bundassa, and Balonne; the Turrubull, on the banks of the river Brisbane; the Dippil, in the north of Moreton Bay, as far as the district of Burneth in Queensland; and the Parnkalla, on the western side of the peninsula of Port Lincoln. Others enumerated are the Pikumbal, Kingki, and Wodi-wodi. The general phonetic principles in all these idioms are extremely simple. They have five vowels, *a, e, i, o, u*; the diphthongs from these; the consonants *k, t, p; v, m, r, z, l*, pronounced somewhat gutturally; and the semi-vowels *y* and *w*. There are no sibilants or aspirates, save in some dialects; *g, d, b* are seldom met and are not clearly articulated. Morphologically the languages of Australia are agglutinative, declension taking place by help of suffixes. The languages of the west are as poor in grammatical forms as Burmese or Siamese; those of the Macquarie Lake recall the structure of the Ugro-Altaic languages; the others, like those of Encounter Bay, offer an analogy to the Basque in their conglomerations of suffixes that almost defy analysis. All these idioms more or less distinguish the three numbers—singular, plural, dual; but the idea of gender seems unknown. The subject, the object, the attribute, the predicate, are only recognised by their position in the phrase, notwithstanding a rich declension by suffixes, which, like Basque, go so far as to differentiate the subject of the intransitive from that of the transitive verb. The verbs have developed a reflexive, a reciprocal, a determinative, and a continuative voice; they have also subjunctive, conditional, and optative forms beyond the ordinary tenses of the indicative (present, imperfect, aorist, future). We find a large number of common roots: the word for 'eye,' for

example, is *mil* in Kamilaroi, Viradurei, Pikumbal, and Kingki; *mai* near the St George River; *més* in Wodi-wodi; *misinhata* at Victoria; *mail* near the Cynges River. The vocabulary is poor enough, and naturally there are no original words expressing abstract ideas. The most scientific studies hitherto made in Australian languages are those of Fr. Müller of Vienna. Like almost all other savages, the native Australians are rapidly vanishing before the advance of civilisation. In the settled districts some of them are usefully employed as shepherds and stockmen, but the majority prefer nomadic habits. The intermittent use of European clothing induces consumption, while the diseases and vices they acquire from Europeans are another potent factor of their destruction. The lowest estimate of their number, prior to European settlement among them, gives over 150,000, the natives still surviving being calculated now at about half that figure. The census of 1881 showed the number to be 31,700, but only natives in the settled districts were included in the returns.

Discovery and Settlement.—The precise date of the discovery of Australia is doubtful. It has been asserted that Magellan's followers sighted Western Australia in 1522, and that a Spanish ship passed Torres Strait in 1545. In a French chart of 1542 it figures as 'Jave la Grande.' It is next distinctly referred to in a book by Cornelius Wytfliet (Louvain, 1598), in which it is conjectured to measure one-fifth of the world. The present Torres Strait refers to the presence of Torres there in 1606. Dirk Hartog Island in the west carries us back to Dirk Hartog and the year 1616. Arnhem Peninsula is a reminiscence of the Dutch vessel *Arnhem*, which in 1618 explored the coast of that land. The Dutch ship, *Guldene Zeepard*, in 1627 sighted a large part of the south coast from Cape Leeuwin eastwards. The Gulf of Carpentaria was named, probably by Tasman, after Carpentier, governor of the Dutch Indies, 1623-27. In 1688 Australia was first seen by British eyes (so far as now known) in the person of Dampier, who gives name to an archipelago in the NW. Near a century later (1770) we find Captain Cook at this island-continent, on his course of circumnavigation of the globe, exploring the whole eastern coast from Gipps Land on the SE. (in Victoria) to Cape York. This expedition stayed a week in 'Botany' Bay, while Sir Joseph Banks and Dr Solander were collecting some thousand species of the wonders of Australian botany to show at home. Bass Strait, on the south, brings us down twenty years later (1790), when Surgeon Bass was there with Lieutenant Flinders. In 1792 Flinders (who gives name to a range of hills in South Australia, and to a river in the north, discharging into the Gulf of Carpentaria) was surveying Moreton Bay and Hervey Bay; in 1801, Spencer Gulf and the Gulf of St Vincent, as also the coast on the east and north. In 1800 Captain Grant, in 1802 Lieutenant Murray, explored the shores of Victoria; the latter discovering the bay of Port Phillip, at the head of which now stands Melbourne. The exploration of the whole coast of Australia was completed by the *Beagle* (in which Charles Darwin sailed), 1837-43.

The first British settlement having been made in 1788 at Port Jackson (on which Sydney now stands), inland exploration necessarily followed; but for the first twenty-five years was confined inside the Blue Mountains, to a district of some 50 miles inland. In 1813, however, that barrier was passed, and the valley of the Fish River and Bathurst Plains were for the first time brought within the limits of civilisation. Two years later (1815) the Lachlan River (tributary of the Murrumbidgee) was lighted on, and traced 300 miles in a

south-westerly direction to a 'marsh.' Next the Macquarie (tributary of the Darling) was discovered, and followed likewise to a 'marsh'—experiences which suggested the theory of a sea in the interior of Australia. Mr Oxley pushed exploration through New South Wales into Queensland, laying open the Brisbane River. In 1819 Hamilton Hume reached the Murrumbidgee; and in 1824 travelled overland from Sydney to Port Phillip, crossing the Upper Murray *en route*. In 1828 Captain Sturt and he followed the Macquarie to its junction with the Darling. In the following year Sturt traced the Murrumbidgee to its junction with the Murray; then sailed down the Murray to its discharge into Lake Alexandrina, a few miles from its entrance to the sea at Encounter Bay; but not finding its mouth, was obliged to return by river after encountering great hardships. Major Mitchell tracked the Lachlan through the 'marshes,' discovered (1835) the Loddon (tributary of the Murray) and Wimmera (intermittent stream to west of it), crossed the Grampians, descended the Goulburn to the Murray, and altogether surveyed the fairest and richest part of Victoria, 'Australia Felix,' as he admirably named it. In 1839 Mr E. J. Eyre (afterwards governor of Jamaica) discovered Lake Torrens (in South Australia); and in 1840, after exploring its eastern shores, and the Flinders Range to the south, accomplished a successful but most perilous and distressing march of 1209 miles from Adelaide to King George's Sound. In 1844-45 Captain Sturt started from the Darling (130 miles above its confluence with the Murray), travelled 250 miles north-westward, then north to the Grey Ranges, over endless deep red sand-ridges, and a barren mud-plain, through 'Spinifex' (spiny lacerating 'porcupine grass'), to a point within 150 miles of the centre of the continent. In 1843-46 Leichardt explored Queensland from the south borders to the Gulf of Carpentaria. In 1844 he crossed from Fitzroy River to the head of the Gulf of Carpentaria, whence he made his way westward along the north coast as far as Port Essington.

One of the greatest and most successful of all Australian explorations was the passage across the whole continent, from south to north, from Adelaide to a point west of Chambers Bay, in 1862, by J. M'Douall Stuart; opening up the Albert River, the Finke River, the Macdonnell Ranges, the Ashburton Ranges, &c., altogether a quite practicable route across the continent through a fairly continuous, if narrow belt of upland and stream, a route utilised in 1872 for a telegraph line, with fixed stations. Nearly contemporaneous with this fortunate expedition was the most tragic one of Burke and Wills. Starting from Melbourne, these two explorers reached Cooper's Creek, the lower course of the Barcoo River. There, leaving the larger portion of their cumbersome cavalcade, Burke and Wills pushed on, passing the M'Kinlay Mountains, and reaching the Gulf of Carpentaria, near the mouth of the Flinders, the first passage made across the continent. On their return journey they perished miserably of starvation at Cooper's Creek. M'Kinlay, sent in search of the lost party, traversed the whole continent to Albert River, on the Gulf of Carpentaria, thence eastward to Burdekin River and Port Denison in Queensland. In 1861 F. F. Gregory explored 800 miles of the NW. of Australia, at a distance of some 200 miles from the coast along the upper courses of the De Grey, Ashburton, Fortescue, and Oakover rivers. The west side of Cape York Peninsula was explored by Jardine in 1864.

The telegraph line of 1872, as a base or goal of adventure to or from the west coast, could not but provoke expeditions to draw communi-

eating lines between it and the west coast. Accordingly, in 1872, Ernest Giles started from Chambers Pillar, near the Charlotte Waters telegraph station; but in spite of the most stubborn resolution, reached only 100 miles to the north of Lake Amadeus. In 1873-74, starting 200 miles farther south, he reached half-way across to the west coast. In 1873, however, Colonel Warburton, starting in April from Alice Springs (just north of the tropic) with camels, arrived in December of that year at Oakover River in Western Australia. In 1874 Mr John Forrest, with horses only, passed from Murchison River on the west coast, to the telegraph line a little to the north of Peake Station. In 1875 Giles crossed from the head of St Vincent Gulf to Perth on the west coast, having traversed 2500 miles through a country unfit for settlement, and for 1000 miles had to force his way through interminable scrub. These expeditions seem to demonstrate that much of the interior of Australia, between the west of the overland telegraph line and the east of the narrow hilly border of Western Australia, is little better than desert, either unmitigated sand or dense scrub or porcupine grass.

The first civilised settlement in Australia was made at Botany Bay in 1788 by 1030 persons, mostly convicts. In 1825 Moreton Bay (now Queensland) was settled as a part of New South Wales, attaining in December 1859 the position of a separate colony. The settlement of Western Australia (the Swan River Settlement, as it was then called) dates from 1829. It continued to be a penal settlement from 1851 to 1868. Port Phillip (now Victoria), then a part of New South Wales, was first colonised in 1835, and on 1st July 1851 was constituted an independent colony. The colonisation of South Australia by British emigrants dates from 1836. A large proportion, it may be noticed, of the geographical nomenclature of Australia is Scotch.

The revenue of all the five colonies, which in 1874 was £9,929,596, had grown in 1885 to £19,348,719; and the debt in the same period (largely incurred for public works) increased from £32,865,024 to £101,822,697. Though house-rent is higher than in England, meat, bread, and groceries are all far cheaper, while clothing is not much dearer than at home. Wages, again, are much higher; and there is a constant demand for agriculturists and female domestic servants.

Population.—Especially since the discovery of gold in 1851, Australia has been advancing in all departments of material well-being at a rate surpassing that of any other country on the globe. In 1788 the first settlement at Botany Bay, Sydney, numbered only 1030 persons; in 1835 the European settlers of Australia (including Tasmania) amounted to 80,000. By 1851 the population had risen to 350,000. The discovery in that year of the gold-fields caused a sudden and enormous inrush of immigrants from all parts of the world, and at the present time the inhabitants of the Australian continent count nearly 2,700,000. Between 1830 and 1885 the population of New South Wales grew from 40,000 to nearly a million; between 1836 and 1885 that of Victoria grew from 224 to close on a million; between 1851 and 1885 that of New Zealand from 26,000 to more than half a million. From 1870 to 1880 the immigration to Australia, Tasmania, and New Zealand averaged daily 160 persons, or 58,000 per annum, the increase of population for that decade doubling the rate of the United States. The population to the square mile is: in Victoria, 11·286; in New South Wales, 3·171; in Queensland, ·489; in South Australia, ·354; in Western Australia, ·036; and on the entire continent, ·901. The population is, of course, almost all of European origin, the predominating element being British.

In 1881 half the population had been born in the colonies, 800,000 in the United Kingdom, whilst 36,000 were Germans, 5500 Americans, and 3000 French. Chinese labourers, 31,000 in number, are found chiefly in Victoria and Queensland; and there are many Polynesians ('Kanakas'—largely from Fiji) in Queensland.

The largest cities are (with their suburbs) Melbourne, capital of Victoria, 491,378; Sydney, of New South Wales, 386,400; Adelaide, of South Australia, 133,220; Brisbane, capital of Queensland, 48,738; Ballarat, Victoria, 46,033; and Sandhurst, Victoria, 37,238.

Government, Colonial Defence, &c.—Each of the great divisions of Australia forms a separate colony, exercising its own administration, passing its own laws, and levying its own fiscal duties; and all of them enjoying responsible government, with the exception of Western Australia, the constitution of which is 'representative.' In Western Australia the Executive Council is composed of the principal officers of the government, and the governor has power to appoint two unofficial members; the Legislative Council consists of the members of the Executive Council, with the exception of the colonial treasurer, 4 nominees of the governor, and 16 elected members. There is, however, a strong agitation in this province towards a more popular and self-responsible government. The government in each of the other colonies consists of the governor, representing and appointed by the Queen; the Legislative Council, corresponding to the House of Lords; and the Legislative Assembly, corresponding to the House of Commons. The Legislative Councils of New South Wales and of Queensland are nominated purely by the crown; those of Victoria and of South Australia are elected by the inhabitants possessing a certain property qualification. The Legislative Assembly is, in all four colonies, elected by manhood suffrage. Imperial laws are in force in all the colonies, unless superseded by local enactments, and all acts passed by the Local Legislature must receive the assent of the Home Government. All votes are taken by ballot. In Victoria, the members of both houses are paid £300 each per annum, for the three years for which they are elected.

An act to constitute a Federal Council of Australasia, 'for the purpose of dealing with such matters of common Australasian interest, in respect to which united action is desirable, as can be dealt with without unduly interfering with the management of the internal affairs of the several colonies, by their respective legislatures,' passed the Imperial Parliament, and became law on 14th August 1885. Representatives of Fiji, Queensland, Tasmania, Victoria, and Western Australia attended the opening meeting, which was held at Hobart on 25th January 1886. New South Wales, New Zealand, and South Australia decided not to join the Federal Council at present; but there seems every reason to hope that the example of Canada may eventually be followed, with a great United Australasian Dominion as the result. The question of common defence has for some time been engaging the attention of the colonies. On the recommendations of Lieutenant-general Sir William Jervois and the late Sir Peter Scratchley, most of the capitals are now strongly fortified towards the sea; the batteries defending Port Jackson and Hobson's Bay being extensive and well armed. Victoria has a navy of its own, comprising a line-of-battle ship, an ironclad, and a sloop of war. South Australia and Queensland also have gun-boats. At Sydney, the rendezvous and headquarters of the Australian squadron, are stationed permanently several men-of-war. The Colonial Conference of 1887, at which representatives of every British colony assembled

in London to discuss with Her Majesty's ministers questions of imperial concern, marked a new era in the relations of the colonies to the mother-country, and indicated what an impregnable position the partnership now being cemented will give to the empire at no distant date. A proposal was favourably received, and will probably be ratified, that a squadron of nearly double the present strength should be permanently stationed by the British government in Australian waters, the colonies contributing £122,000 per annum towards the cost.

Religion.—There is no state church in Australia, all religious sects being self-supporting. In respect of numbers, Episcopacy is the dominant form of religion, Roman Catholics come second, Presbyterians third, and Methodists fourth.

Education and Literature.—Education has of late been rapidly diffusing itself. In all the colonies, education is either free and compulsory, or the primary schools are all so liberally endowed by the government, as to place elementary instruction within the reach of all classes; while libraries, museums, botanical gardens, schools of art, mechanics' institutes, &c. are multiplying in all the colonies under the liberal patronage of the several governments. The Melbourne Free Library has upwards of 200,000 volumes. There are universities in Melbourne, Sydney, and Adelaide, and also well-equipped astronomical observatories. The names of Baron Von Mueller and of Dr Schomburgk are well known to all botanists. Meteorological science is diligently cultivated; and geographical and other societies are numerous and active.

But in Australia, literary enterprise is mainly absorbed in journalism, as may well be believed when it is mentioned that in the Australasian colonies, including Tasmania and New Zealand, some 800 newspapers, magazines, and periodicals are published, many of them dailies. Melbourne and its suburbs alone issue more than 30 newspapers and magazines. The leading dailies rival English papers in appearance and enterprise; the weeklies, frequently illustrated, are many of them remarkable for cheapness, variety of contents, and 'smart' writing. Satirical periodicals and 'society' papers are well represented.

The current book literature is of course mainly that of the old country; and of the literature produced in the colonies, by far the greater part is the work of men born and bred in Britain. In literature proper, there are three outstanding names—those of Lindsay Gordon, Marcus Clarke, and Henry Kendall. English by birth, and a soldier by profession, Gordon is nevertheless the poet whose verse is oftenest on Australian lips. His work is mainly English in feeling; but some of his poems, notably 'The Sick Stock-rider,' are

rich in local colour. His best-known verses are his *Bush Ballads* and *Galloping Rhymes*. Kendall is the only Australian born who has secured a permanent place in the affections of Australians; and his poetry is eminently racy of the soil, being a true reflection of Australian scenery and Australian life. His most sustained effort is *Orana*, a narrative poem of adventure and tragedy in the bush. Marcus Clarke, the son of a London barrister, is the most notable Australian prose-writer, his chief work being the novel *For the Term of his Natural Life*. These three writers all died under thirty-seven years of age. J. Brunton Stephens, a graduate of Edinburgh, may after twenty years in Australia be regarded as an Australian poet. Dr Hearn has written in prose on *The Aryan Household*, on *The Government of England*, and on *Pletology*. Henry Kingsley was for a few years a colonist; and his descriptions of Australian life, especially in *Geoffrey Hamlyn* and *The Hillyars and the Burtons*, are singularly vivid. Mrs Campbell Praed has written *Policy and Passion*, and other novels dealing more or less directly with Australian subjects and scenes. And Charles Reade, though without the advantage of Australian experiences, has, in *It's Never too Late to Mend*, given many their most lively ideas of bush-life.

Produce.—The chief and most general staple produce of Australia, for which the country is peculiarly adapted, and which constitutes its largest export, is wool. Over all the highland and river-lands of the sea-border—wherever, in fact, there is water—sheep thrive remarkably, except perhaps within the tropics, and the wool is of the finest quality, realising the highest prices in the English market. The produce of wool in Australia in 1884 was 320,076,988 lb., valued at £16,737,353. The cereals of Europe and maize have been introduced into the island-continent with the happiest success, and from 1875 to 1885 the wheat-crop of the five colonies rose from 18,000,000 bushels to 27,060,000 bushels. South Australia is the principal wheat-growing colony as regards the area under cultivation, but is being rapidly overtaken as to yield by the neighbouring colony of Victoria. Potatoes everywhere yield abundantly. The vine is extensively cultivated, and the produce of New South Wales, South Australia, and Victoria was highly commended at the London Exhibition of 1886. Sugar is a very important and increasing product of Queensland, and is also cultivated in New South Wales. Cotton is grown in Queensland. The fruit-trees of Europe and of many of the tropical and subtropical climates also thrive luxuriantly. Tobacco is also grown. The native timber is distinguished for its hardness, durability, and building properties.

The following table gives a comparative view of the agricultural produce of the continent:

HARVEST OF 1885.

Colonies.	Wheat.	Oats.	Barley.	Maize.	Other Cereals.	Potatoes.	Hay.	Wine made.
	Bushels.	Bushels.	Bushels.	Bushels.	Bushels.	Tons.	Tons.	Gallons.
Victoria	9,170,563	4,602,808	1,302,254	181,309	740,889	163,303	443,113	1,908,837
New South Wales	2,733,133	279,107	85,606	4,336,163	14,531	88,638	191,372	553,470
South Australia (1884) ..	14,621,755	88,689	211,907	64,826	23,192	233,639	472,535
Queensland	51,508	1,906	9,536	1,074,294	18,000	30,000	123,000
Western Australia	339,876	23,142	80,581	1,050	1,005	19,077	50,388
Total	26,916,609	5,084,197	1,699,074	6,098,647	845,966	245,168	909,006	2,226,618

In 1891 the wheat crop of Victoria was 13,608,000 bushels; of New South Wales, 2,649,215; and of South Australia, 14,260,964. The chief crop of Queensland, maize, amounted to 2,373,603 quarters in 1890.

Commerce.—The trade of Australia exhibits a remarkable development, the average of trade per inhabitant being about five times that of Europe, and nearly five times that of Canada. The imports of Australia have risen from £35,567,716 in 1874, to £54,031,084 in 1885; the

exports in the same period from £36,724,886 to £43,419,854. It has not escaped the influence of the wave of depression which has affected the whole of the civilised world during recent years, and has also suffered from a succession of bad seasons, and the fall in the value of staple products.

The exports consist principally of wool, frozen meat, preserved meat, tallow, skins of all kinds, hides, wheat, cotton, sugar, and wine. The return for 1885 gives the number of sailing-ships and steamers belonging to the Australian colonies at a total of 1939, with a net tonnage of 246,687 tons. New South Wales, alone of all the divisions of Australia, has (since the governorship of Sir Hercules Robinson, 1872-79) adopted the principle of free-trade. A heavy protective tariff prevails in Victoria, and the example of this colony has been followed by South Australia; but the feeling in the other colonies is less pronounced.

Railways and Telegraphs.—Since 1870, railways and telegraphs have been increasing at a ratio, in relation to population, far exceeding that of the United States. Two main trunk-lines of railway connect the southern seaboard of Victoria with her northern frontier. There is a railway line from Adelaide, *via* Melbourne and Sydney, to Brisbane, the connection having been completed in 1888. Queensland is intersected by three trunk-lines, already running from the east coast for many miles into the west, and their continuation across the whole breadth of the colony, and northwards to the Gulf of Carpentaria, is in assured prospect. She has a line already touching the border of New South Wales. Railway extension is proceeding actively in South Australia also, the transcontinental line having been carried from Adelaide to the Peak. A line of 125 miles is in operation in Western Australia, and other lines are in course of construction. At the end of 1885 the railway lines of Australia already working measured 6134 miles, and 1840 miles were in course of construction. Telegraphi-

cally, the colonies are now all linked together with Tasmania and New Zealand, and with the mother-country *via* Java and India. The telegraphic traffic is enormous, double that of Great Britain in proportion to the population. The telegraph lines at the end of 1885 measured 31,215 miles, embracing 53,437 miles of wire.

Manufactures suitable to the country are rapidly developing. Magnificent lines of steamers maintain frequent communication with Europe and America, between the various colonies, and with the Fiji Islands and New Caledonia. Mails have been delivered in Adelaide in twenty-nine days from London, *via* Brindisi, and the sea-passage between Adelaide and Plymouth may be covered in about thirty-five days. In 1887 mails were delivered at King George's Sound in less than twenty-four days from London. The length of the voyage in sailing-ships ranges generally from seventy to one hundred days. The principal lines are the P. & O., the Orient, the British India (*via* Torres Strait), the Union (San Francisco to New Zealand), the French Messageries Company, and a German service, the last two being subsidised by their respective governments. The Canadian Pacific Railway Company has proposed to carry mails across Canada, thus avoiding the necessity of traversing any but British territory *en route*; but it is doubtful whether any gain in speed will be effected, as the best time *via* San Francisco to Sydney has hitherto been about thirty-nine days.

Statistics.—The following are some of the statistics of the Australian colonies for 1881 and 1891. For comparison we add those of Tasmania and New Zealand.

STATISTICS—1890-91.

COLONIES	Area in Sq. Miles.	Population in 1881.	Population in 1891.	Revenue in 1890.	Public Debt in 1890.	Imports in 1890.	Exports in 1890.	Miles of Railway in 1890.	Miles of Telegraph in 1890.	Acres under crop in 1890.
Victoria.....	87,384	862,346	1,140,411	8,340,813	43,610,265	22,064,015	13,205,722	2,988	6,956	2,627,000

Austrasia, or the East Kingdom, the name given, under the Merovingians, to the eastern possessions of the Franks, embracing Lorraine, Belgium, and the right bank of the Rhine, and having their central point at Metz. At the time of the rise of the Frankish power, these districts were of great importance, as they formed the connection with the German mother-country, and were the most thickly inhabited by Franks. Under Charlemagne's successor, Austrasia merged into

Germany; and Neustria, or West Frank-land, into France.

Austria, the usual name of the great empire now officially called the AUSTRO-HUNGARIAN MONARCHY, is a Latinised form of the German *Oesterreich* (Fr. *Autriche*), meaning 'Eastern Kingdom.' Since 1867, the empire is composed of a union of two states under one emperor, but administratively distinct. The one is Austria, or Cisleithania ('on this side the Leitha,' a tributary of the Danube, on the frontiers of the archduchy of Austria and Hungary); the other, Hungary and the lands of the Hungarian crown, or Transleithania. The relation of the two divisions to one another is discussed below, and at the article HUNGARY. The present article deals with the empire as a whole. The Austrian dominions form geographically a compact territory, with a circumference of about 5350 miles. The total area, 240,456 sq. m., is greater than that of any other European state save Russia, and is nearly twice the area of the United Kingdom. The body of the empire lies in the interior of Europe, though it has about 500 miles of sea-coast on the Adriatic. Austria borders on Italy, Switzerland, Bavaria,

Saxony, Prussia, Russia, Roumania, Servia, and Montenegro. With the sanction of the Berlin Congress of 1878, the small territory of Spizza, on the Montenegrin frontier and formerly Turkish, has been incorporated with Dalmatia. The Turkish provinces of Bosnia and Herzegovina, though occupied and also administered by Austria, cannot strictly be regarded as part of the Austro-Hungarian monarchy.

Area and Population.—The following table shows the area and population of the empire at the census of December 1880:

I. AUSTRIAN LANDS—	Area in Sq. Miles.	Population in 1880.
Lower Austria.....	7,634	2,329,021
Upper Austria.....	4,381	760,879
Salzburg.....	2,707	168,506
Styria.....	8,870	1,212,367
Carinthia.....	4,005	348,670
Carniola.....	3,856	481,176
Gürz, Gradiška, Istria, and Trieste.....	3,064	650,807
Tyrol and Vorarlberg.....	11,324	911,887
Bohemia.....	19,980	5,557,134
Moravia.....	8,583	2,151,619
Silesia.....	1,987	565,772
Galicia.....	30,307	5,961,964
Bukovina.....	4,035	569,599
Dalmatia.....	4,940	476,164
Total for Austria.....	115,823	22,130,706
II. LANDS OF THE HUNGARIAN CROWN—		
Hungary and Transylvania.....	107,868	13,700,005
Fiume.....	8	21,363
Croatia and Slavonia (including since 1881 the former Military Frontier).....	16,767	1,889,351
Total for Hungary.....	124,633	15,610,719
Total for the Monarchy.....	240,456	37,741,424

At the census of 1890 the total for Austria was 23,895,413, and for Hungary, 17,335,929. This includes the army and landwehr, amounting in 1891-92, on a peace footing, to 337,419 men; and on a war footing, to 1,872,178. The naval forces consisted in 1891 of 11 armour-clads, 14 cruisers and torpedo ships, 57 torpedo boats, besides station ships, &c. In 1880 Austria had five cities of over 100,000 inhabitants: Vienna, the capital of the empire, 1,103,857 (in 1869, 833,855; in 1875, 1,020,770); Budapest (Pesth), 360,551; Prague, 177,026; Trieste, 144,844; and Lemberg, 109,746. These figures include the garrisons and the suburbs, which, in the case of Trieste, doubled the population of the town proper. Besides these five, there were seven cities with over 50,000, and 42 with over 20,000 inhabitants. After Trieste, the chief harbours are Fiume in Croatia, and Curzola in Dalmatia, with over 20,000 inhabitants; and Zara, Spalatro, and Rovigno, with over 10,000. More than two-thirds of the population are engaged in agriculture; but there is a constantly increasing tendency to concentration in the large towns. The following table of the civil population shows a steady increase since 1818, if we remember that between the census-dates of 1857 and 1869 the empire lost its Lombardo-Venetian territories, with over 5,000,000 inhabitants:

Year.	Population.	Year.	Population.
1818.....	29,769,263	1857.....	37,339,012
1830.....	34,082,469	1869.....	35,634,856
1842.....	35,295,957	1880.....	37,786,346

The Treaty of Berlin of 1878 gave Austria the right of occupying and administering Bosnia and Herzegovina, with the adjoining sanjak (district) of Novi Bazar, which makes it expedient to add the area and population of these Slavonic provinces of the Turkish Empire here:

Districts.	Area in Sq. Miles.	Pop. in 1880.
Bosnia.....	16,142	1,143,517
Herzegovina.....	3,515	187,574
Novi Bazar.....	8,522	168,000
Total.....	23,179	1,504,091

Surface.—Three-fourths of Austria is moun-

tainous or hilly, being traversed by three great mountain-chains—the Alps, Carpathians, and Sudetes, whose chief ridges are of primitive rock. The Rætian and Noric Alps stretch from Switzerland to the Danube, and contain the highest points of the Austrian territories, the Ortler Spitze rising to 12,814 feet. Their height declines gradually towards the east, where the Leitha Hills (3000 feet), overlooking the plain of Vienna, form the transition to the Carpathians. This chain, extending for 880 miles, rises on the left bank of the Danube, near Presburg, and sweeping in a curve, first east, and then southward through Transylvania, again meets the Danube. The central part, or Tatra Mountains, are vast granitic masses, resembling the Alps in character; the highest of these is the Gerladorfer Spitze, 8517 feet, and their average elevation is over 6000 feet. Springing from the north-west bend of the Carpathians, the Sudetes run through the north-east of Moravia and Bohemia, in which last the range is known as the Riesengebirge, or Giant Mountains. The boundary between Bohemia and Prussian Silesia passes over the Schneekoppe, the highest peak of these mountains, which is 5330 feet in height. Continuous with this range, and beginning on the left bank of the Elbe, are the Erzgebirge, or Ore Mountains, on the confines of Saxony; and veering round to nearly south-east, the range is further prolonged in the Böhmerwald, between Bohemia and Bavaria. The chief plains of the Austrian empire are the vast lowlands of Hungary (the one in the west is about 4200 sq. m. in extent; the other, which is in the east, and traversed by the Danube and the Theiss, has an area of 21,000 sq. m.), and the plain of Galicia.

From the Gulf of Trieste to the south point of Dalmatia, Austria has a sea-line of about 1000 miles, not counting the coasts of the numerous islands, the largest of which is Veglia, 23 miles by 12. The chief lakes are Lake Balaton (392 sq. m.) and the Neusiedler See (117), both in Hungary. The Alps and Carpathians inclose numerous mountain-lakes. That in the Tatra Mountains lies at an elevation of 6000 feet. The most remarkable of all is the Zirknitz Lake (q.v.) in Illyria. There are extensive swamps or marshes in Hungary.

The leading rivers that have navigable tributaries are: the Danube, which has a course of 850 miles within the Austrian dominions, from Passau, at the mouth of the Inn, to Orsova, on the frontier of Wallachia, its navigable affluents being the Inn, Save, Drave, March, Waag, and the Theiss, which drains nearly half of Hungary; the Vistula, with its tributary the Bug; the Elbe, with the Moldau and Eger; the Dniester and Adige. The Rhine flows for about 25 miles of its course between Austria and Switzerland. The Isonzo, Zermagna, Kerka, and Narenta flow into the Adriatic.

The canal system of Austria is not extensive. The Vienna and Neustadt Canal, in Lower Austria, has a length of 40 miles; the Bacsar or Franz Canal, between the Danube and Theiss in Hungary, 70 miles; and the Bega Canal, constructed by the Romans, between the Bega and Temes, 83 miles.

The climate of Austria is on the whole very favourable; but from the extent and diversity of surface, it presents great varieties. In the warmest southern region between 42°-46° lat., rice, olives, oranges, and lemons ripen in the better localities; and wine and maize are produced everywhere. In the middle temperate region from 46°-49°, which has the greatest extent and diversity of surface, wine and maize still thrive in perfection. In the northern region, beyond 49°, except in favoured spots, neither wine nor maize succeeds; but grain, fruit, flax, and hemp thrive excellently. The mean

temperature of the year is, at Trieste, 58° F.; at Vienna, 51°; at Lemberg, in Galicia, 44°. The rainfall ranges from 16 inches in the plains of Hungary to more than 60 inches in the neighbourhood of the Alps.

Minerals.—Its mineral wealth is not surpassed in any European country; it is only lately that Russia has exceeded it in the production of gold and silver. Mining has been an important pursuit in Austria for centuries, and has been encouraged and promoted by the government. Bohemia, Hungary, Styria, Carinthia, Salzburg, and Tyrol take the first place in respect of mineral produce. Except platinum, none of the useful metals is wanting. The mines are partly state property, and partly owned by private individuals. The value of their yearly produce is estimated at about £9,000,000. Of this sum coal yields about a half, iron a fifth, salt a tenth, and gold and silver together one-fourteenth. The number of persons employed in mines and smelting-works is about 150,000, a third of whom are in Hungary. Gold is found chiefly in Hungary and Transylvania, and in smaller quantity in Salzburg and Tyrol. The same countries, along with Bohemia, yield silver. Quicksilver is found in Hungary, Transylvania, Styria, and Carinthia. Copper is found in many districts, tin in Bohemia alone. Zinc is got chiefly in Cracow and Carinthia. The most productive lead-mines are in Carinthia. Iron is found in almost every province of the monarchy, though Styria, Carinthia, and Carniola are chief seats. Antimony is confined to Hungary; arsenic, cobalt, sulphur, and graphite are wrought in various parts of the empire.

The useful earths and building-stones are to be had in great profusion; likewise marble, gypsum, chalk, &c. Of precious and semi-precious stones are the Hungarian opal, Bohemian garnets, cornelians, agates, beryl, amethyst, jasper, ruby, sapphire, topaz, &c. Austria is peculiarly rich in salt. Rock-salt exists in immense beds on both sides of the Carpathians, chiefly at Wieliczka (q.v.) and Bochnia in Galicia, and in the county of Marmaros in Hungary, and in Transylvania. The annual production of rock-salt is from three to four million cwt. Salt is also made at state salt-works by evaporating the water of salt-springs. The chief works are those at Ebensee, Aussee, Hallstadt, Ischl, Hallein, and Hall in Tyrol. From two to three million cwt. are thus produced annually. A considerable quantity is also made from sea-water on the coasts of the Adriatic. The sale of salt is in Austria a government monopoly. Of other salts, alum, sulphate of iron, and sulphate of copper are the chief. There are inexhaustible deposits of coal in the monarchy, and of recent years a great deal has been done to develop this particular branch of mining. At present, over 6,000,000 tons are annually raised from the mines, which are spread over all the provinces, but the richest of which are in the mountain-systems of Moravia and Bohemia. Austria has abundance of valuable mineral springs; about 1600 are enumerated, some of them of European reputation, as the sulphur baths of Baden in Lower Austria, the saline waters of Karlsbad, Marienbad, Franzensbad, Teplitz, &c., all in Bohemia.

In 1870-80 the minerals of Austria Proper were worth £8,500,000 a year, and of Hungary about £2,000,000. The most important items are gold, silver, quicksilver, zinc, copper, lead, iron, graphite, and mineral coal. In 1884 the total value of all minerals was £6,011,675; of furnace products, £2,644,432. The number of persons engaged in mining was 91,453, and in metal-works 12,621. For the same year, the minerals of Hungary were valued at £1,876,000, besides the products of the

salt-mines, returned at £1,152,000, while the number of persons employed in the mines and works was 45,719.

Vegetable Products.—These, as might be expected from the wide range in soil and position of the different provinces, are extremely various. Although three-fourths of the surface is mountainous, more than five-sixths is productive, being used either for tillage, meadows, pasture, or forest. Grain of all kinds is cultivated, most abundantly in Hungary and the districts south of it on the Danube; in Bohemia, Moravia, Silesia, and Galicia. Agriculture is not yet far advanced; the Magyar adheres to his primitive husbandry; the German and Slav have adopted more improved methods. Rice is cultivated in the Banat. Potatoes are raised everywhere; and in elevated districts are often the sole subsistence of the inhabitants. Horticulture is carried to great perfection; and the orchards of Bohemia, Austria Proper, Tyrol, and many parts of Hungary, produce a profusion of fruit. Great quantities of cider are made in Upper Austria and Carinthia, and of plum-brandy in Slavonia. In Dalmatia, oranges, lemons, and a few olives are produced.

In the production of wine, Austria is second only to France. With the exception of Galicia, Silesia, and Upper Austria, the vine is cultivated in all the provinces; but Hungary stands first, yielding not only the finest quality of wine, but four-fifths the amount of the whole produce of the empire. Tokay and Carlowitz are amongst the best-known varieties of Hungarian wine. The average produce of the whole empire is estimated at about 200 million gallons, which is mostly consumed by the inhabitants themselves.

Flax and hemp are cultivated almost universally. Tobacco is raised in great quantities, especially in Hungary, which also is first in the cultivation of rape-seed. Bohemia raises hops of the first quality. Nearly a third of the productive surface is covered with wood (66,000 sq. m.), which, besides timber, yields a number of secondary products, as tar, potash, charcoal, bark, cork, &c.

Animals.—Bears are found in the Carpathians, Alps, and Dalmatia; wolves and lynxes in these same districts, and also in the Banat, Croatia, and Slavonia. The marmot, otter, and beaver are also found in Dalmatia. The wild goat lives in the highest, the chamois and white alpine hare in the middle regions of the Alps and Carpathians. There are productive fisheries in the Danube, Theiss, and numerous streams, lakes, and ponds. The sea-fisheries belong to Dalmatia. Leeches, procured chiefly in Hungary and Moravia, form an article of trade. For foreign commerce the most important branch of rural industry is the rearing of silk. Austria produces about a quarter of a million of silk cocoons annually, the Tyrol being the chief centre of this industry.

The breeding of domestic animals is in some districts excellent, in others quite neglected. For horse-breeding there are, besides a number of imperial studs, a great many private establishments, especially in Hungary, for the same purpose. The supply of cattle is not equal to the demand, although great numbers are furnished by Hungary and Galicia. The breeding of sheep, like that of horses, has been a special object of care to the government. The great mass of the wool produced is composed of what are known as middling and inferior sorts. Goats are reared chiefly in Dalmatia, and swine in Hungary. Nearly three-fourths of the population are engaged in husbandry, so that Austria is an agricultural state, though its capabilities have not been fully developed.

Manufactures.—The industry of Austria is not yet adequately developed, but of late years has made great strides. An official estimate of the annual value of the manufactures of the empire in 1880 gave it at over £100,000,000. Bohemia takes the lead in this industry, then follow Austria Proper, Moravia and Silesia, and Hungary. Vienna is the chief seat of manufacture for articles of luxury; Moravia, Silesia, and Bohemia for linen, woollen, and glass wares; Styria and Carinthia, for iron and steel wares. The chief manufactured articles of export are those of silk and wool; the only others of consequence are linen twist, glass wares, and cotton goods. The yearly value of manufactured iron is considerable. The glass wares of Bohemia are of special excellence. The hemp and flax industry is one of the oldest and most important. No branch of industry has risen more rapidly than that of cotton. The manufacture of silk is very extensive. The manufacture of tobacco is a state monopoly, and brings a revenue of nearly 60 million florins; the salt monopoly, 18 millions.

In respect of commerce, Austria is most unfavourably situated. High mountains oppose great obstacles on all hands to communication, and separate the producing districts from the only sea that touches the empire; while the chief navigable rivers have their mouths in other countries. Much has been done to remedy these obstacles. Since 1809 a great number of high-ways have been made. The great Alpine roads over the Stelvio Pass and the Semmering (q.v.) are among the most remarkable constructions of our times. More remarkable still are the railways over the Brenner Pass and the Semmering. The state in 1841 resolved to undertake the construction of railways, and now a tolerably complete network of railway brings all places of importance into easy communication with one another.

River-communication received a great impulse from the introduction of steam. By means of the Danube Steam Navigation Company, formed in 1850, passengers and goods are now conveyed on the Danube between Ulm and Galatz, and on to Constantinople. Since 1856 the management of the navigation of this river has been intrusted to two commissions (see *DANUBE*), but the Austrian traffic is at least somewhat repressed by the fact that the mouth of the river is outside the limits of the empire.

A great number of the political impediments to commerce have been removed or diminished. The customs-boundary that separated Hungary and the adjoining provinces from the rest of the empire was done away in 1851, so that the whole was included in one customs-district, with the exception of Dalmatia, the free ports of Trieste, Fiume, &c.; and measures have been taken to secure that these too shall be gradually incorporated with the rest of the empire. By the tariff of 1852 Austria passed from a prohibitive to a protective system. No article is admitted duty-free; but absolute prohibition is confined to articles of state monopoly (salt, powder, and tobacco). But the foreign commerce of Austria is nothing compared with that between the different provinces.

Commerce.—Between the years 1875 and 1885 the total imports, exclusive of bullion, were smallest in 1876 (£44,532,000), and highest in 1882 (£54,515,000); the exports smallest in 1875 (£45,905,000), and highest in 1882 (£65,158,000). The chief articles of import are vegetable fibres and manufactures, the value of which amounted to £5,772,500 in 1885; the silk imported was valued at £4,475,000; vegetables and fruits, £4,038,800;

fats and oils, £3,013,000; grain and pulse, £2,743,700; colonial wares, £2,298,800; clothing, &c., £2,287,700; animals, £2,247,800; and machinery, £1,884,000. The chief exports are grain, flour, and pulse, which amounted to £8,037,300 in 1885; fuel, £6,585,900; sugar and molasses, £4,221,600; wool and woollens, £3,333,400; and cattle, £2,888,800. Nearly two-thirds of the whole commerce of the empire is carried on with Germany. Its next best markets are Roumania, Russia, Italy, and Servia. The direct trade with Great Britain is comparatively small; the Board of Trade returns recognising only the trade by way of the Austrian seaboard. Between 1875 and 1885 the exports from Austria to Great Britain varied from £855,000 (1876) to £2,337,000 (1883); and the goods imported direct from Great Britain, from £1,041,600 (1877) to £593,000 (1880). The total trade of the free port of Trieste in 1885 was: imports, £13,968,000; exports, £13,669,000.

Railways and Postal Service.—The following table shows the total length, in English miles, of railway lines in the empire open for traffic in 1886:

	Austria.	Hungary.	Total.
State lines worked by the state.....	2,240	2,280	4,520
" " " companies.....	60	60	120
Companies' lines worked by the state.....	981	370	1,351
" " " companies.....	5,043	2,992	8,035
Total.....	8,323	5,602	13,925

In Bosnia and Herzegovina there were at the same date three military lines, with a total length of 275 miles. The length of the telegraph lines in the empire in 1885 was upwards of 35,000 English miles. The number of messages carried in 1885 was over 10,000,000. In 1885 there were in Austria proper 4263 post-offices; and in Hungary, 3613. The number of letters and packets passing through the post in 1885 in Austria was 436,507,000; and in Hungary, 129,832,000. These figures are exclusive of newspapers, of which over 132,000,000 were conveyed through the mails in the same year. Bosnia and Herzegovina possess 19 post-offices, 11 telegraph stations, and 58 establishments combining both uses, all under control of the military authorities; but no details are issued as to their employment.

Finance.—There are three distinct budgets, one for the whole empire, another for Austria Proper, and a third for the kingdom of Hungary. Besides their share of the interest on the national debt, Austria has to pay 68·6 and Hungary 31·4 per cent. towards the 'common expenditure of the empire,' an arrangement which renders a deficit here impossible. The budget estimates for the imperial expenses for the year 1886 were £12,566,500. For the administration of Bosnia and Herzegovina in that year, the expenditure was set down at £845,000, and the revenue at £849,000, the cost of the army of occupation being set down at £595,000. —The accounts of *Austria Proper* generally show large deficits, and of recent years a growing expenditure. In 1888 the receipts were £31,733,000; the expenses, £32,289,000; the deficit, £556,000; in 1879 the receipts were £48,438,000; the expenses, £49,009,000; the deficit, £571,000; and in 1886 the revenue was estimated at £50,783,000; the expenditure at £51,662,000—deficit £879,000. The direct taxation amounts to about 8s per head of the population. The heaviest item of expenditure is the interest and sinking fund of the public debt, which has grown up gradually since the middle of last century, amounting in 1789 to about £35,000,000, and in 1886 to over £332,000,000. To this must be added the government paper-money, £41,000,000, showing a total debt of over £373,000,000. The interest on the public debt amounted in 1886 to £12,525,000, of which

Hungary had to contribute about £3,000,000. Since 1868 Austria and Hungary have contracted all loans separately. The accounts of Hungary, with her large special debt, are hardly more promising. In 1877 the revenue was £21,833,000, and the expenditure £23,341,000; in 1886 the estimates were respectively £32,963,000 and £34,368,000, showing an anticipated deficit of £1,405,000. During these ten years the annual income has increased over 50 per cent., but in no single year has the deficit been less than £1,100,000, while in 1879 it exceeded £3,400,000. In the best year, 1885, the direct taxation amounted to 12s. per head. Of the expenditure in 1886, £7,600,000 was appropriated for interest on the special debt of Hungary, which, in the beginning of 1885, amounted to £127,158,000. This debt has grown up mostly since 1848, and has been contracted largely in the purchase and construction of railways, the expenses of which greatly exceed the receipts.

Inhabitants.—The population is very unequally distributed. The most populous districts are those of the south-west and of the north-west. The Alpine regions and those of the Carpathians are sparsely; and generally the density diminishes towards the east. The population of Austria embraces a greater number of races, distinct in origin and language, than that of any other European country except Russia. The Slavs are the most numerous race, amounting to nearly 42 per cent. of the whole population. They form the bulk of the population of Bohemia, Moravia, Carniola, Dalmatia, Croatia, Slavonia, the Woiwodina, the north of Hungary, and Galicia. They are, however, split up into a number of peoples or tribes, differing greatly in language, religion, culture, and manners; so that their seeming preponderance in the empire is thus lost. The chief branches of the Slavic stem are, in the north, the Czechs or Bohemians (the most numerous of all), Rutenians, and Poles; and in the south, the Slovenians, Croats, Serbs, and Bulgarians. The Germans number above 25 per cent. They are dispersed over the empire, but predominate most in the duchy of Austria, Salzburg, Tyrol, Styria, Carinthia, and the west of Hungary. The Romance peoples (speaking languages derived from that of ancient Rome) amount to fully 9½ per cent., and are divided into western and eastern. The western consist of Italians, inhabiting the south of Tyrol, Istria, and Dalmatia; the Ladins (Latins), occupying some valleys in Tyrol; and the Friulians about Görz, north of Trieste. The eastern Romance people are the Roumanians, who are found in Transylvania, Hungary, the Woiwodina, and the Bukowina. The Magyars, or Hungarians proper, number over 16 per cent.: they are located chiefly in Hungary and Transylvania; also in the Woiwodina, and a few in Croatia and Slavonia. The small remaining portion is composed chiefly of Jews, Armenians, and Gipsies.

The principal languages are German, Hungarian, and Bohemian. The literature of these languages will be found discussed under GERMANY, HUNGARY, BOHEMIA. The Polish (see POLAND) and Rutenian (q.v.) languages are also spoken by many subjects; for the language of other sections of the population, see BULGARIA, CROATIA, SLAVS.

Religion.—The Roman Catholics in Austria have a large preponderance over other religious bodies. In 1880 there were 25,543,000 Roman Catholics; 4,036,600 Greeks and Armenians united with the Roman Church; 2,928,000 non-united Greeks and Armenians; 3,611,000 Protestants (Lutherans, Calvinists, Unitarians)—of whom over 3,210,000 are in the Hungarian section of the monarchy; 1,643,000

Jews. The Church of Rome has 11 archbishoprics and 40 bishoprics, and an army of secular priests. At the accession of Joseph II. there were 2924 convents; but at the end of the French war (1816) they had been reduced to 800. There are at present nearly 300 abbeys and above 500 convents in the empire.

Education.—The following figures show how amply the government has provided for the educational wants of the people. In 1878 there were in the empire 32,273 Volks-schulen, 143 training schools for teachers, 271 gymnasiums, 166 secondary schools, 13 schools of law, 91 theological colleges, and 752 other professional and technical institutions, including naval and military academies, and schools of science, art, music, commerce, mining, and agriculture. In 1885 the elementary schools of the dual empire had 4,581,600 pupils, of whom 2,790,000 were in the Austrian division. In 4195 schools Czech was the language of instruction. In 1887 the Austrian universities (named below) had 14,540 students; the Hungarian ones, 4169. Vienna has itself 4090 students.

Education in Austria has been under the care of a minister of Public Worship and Instruction since 1849; and in 1867 a similar minister was appointed for Hungary. Instruction, whether high or low, is mostly gratuitous, or is given at a trifling cost, being provided from general or local public funds. The primary schools in Austria are to a very large extent in the hands of the clergy, and there the Roman Catholic religion forms an essential part of the instruction. The number of elementary schools has increased greatly in recent times. The law enforces compulsory attendance at the 'Volks-schulen,' or national schools, of all children between the ages of six and twelve; parents are liable to be punished for neglecting to send them, and only where Jews or Protestants have established elementary schools of their own can they keep their children from the national institutions. There is a very great difference between the German provinces and the Slavonic ones in respect of education. In Vorarlberg 82 per cent. of the inhabitants read and write; in Bukowina (1880) not quite 10 per cent. There are eleven universities in the empire, at Vienna, Prague, Grätz, Brünn, Innsbruck, Pesth (Budapest), Cracow, Klausenburg, Lemberg, and Czernowitz. Vienna, Grätz, and Innsbruck rank as German universities; Prague has since 1869 a Bohemian and a German university. There are a large number of establishments where the pupils are received young, and educated and trained for the army and navy, for the counting-house, for the mine and the farm, as acrobats, &c. There are also a large number of institutes for the promotion of science and art. The chief libraries are the Imperial and University libraries of Vienna. There are in the whole monarchy about 800 newspapers and other periodical prints, of which fully the half are in German. Such of them as are political are fettered by conditions which render them quite worthless as organs of public opinion.

Army and Navy.—Military service is compulsory on all citizens capable of bearing arms. The term of service is twelve years—three in the standing army, seven in the reserve, and two in the landwehr. Since 1869 the military forces of the empire have been divided into the standing army and reserve; the Landwehr (q.v.); and the Ersatz-reserve, a class of conscripts intended to fill up the regiments in time of war, but enjoying a permanent furlough during peace. A law passed in 1886 added also the Landsturm, made up of volunteers not belonging to any of the other forces. The army has on a peace footing 302,000 men, and on a war footing 1,100,000; under the

law of 1886, it is expected this will be increased to 2,000,000 or more. (See the paragraph on Austria in the article ARMY.) The navy was recruited partly by a levy from the seafaring population, and partly by voluntary enlistment. The term of service extends for ten years, including three in active service and seven in the reserve. The chief port for the navy is Pola, and its principal arsenal Trieste. In 1887 the navy comprised 10 ironclads, 7 cruisers, 6 torpedo vessels, 34 torpedo boats, and 16 vessels for coast defence. These are manned by about 10,000 men, raised to 14,000 in time of war.

Government.—Austria is a monarchy hereditary in the House of Hapsburg-Lorraine. In the case of the reigning family dying out, the states of Bohemia and of Hungary have the right of choosing a new king; but for the other crownlands, the last sovereign appoints his own successor. The reigning house must profess the Roman Catholic faith.

Till 1848 Hungary and Transylvania had a constitution limiting the monarchy, which was absolute for the rest of the empire; though the several provinces had each its consultative council composed of clergy, nobles, and burghers. After the Revolution of 1848, and the subsequent reaction, all marks of independence of the separate provinces disappeared. The imperial constitution granted March 4, 1849, as well as the provincial constitutions that followed, were abolished, and government was organised in the most absolute form by the imperial letters-patent of December 31, 1851. The different provinces of the monarchy were divided into circles, the chiefs of which were nominated by the central authority. All the machinery of a free and constitutional government was set aside. In order to support itself in this course, the government had to seek aid from the Catholic Church, with which it established the concordat of 1855. By this agreement with Rome, Catholicism became a privileged religion, with control of education and of the censorship of books. Thus the reaction was complete. Of the reforms of 1848, there remained only one of importance, the abolition of serfdom.

Since the year 1867 Austria has been reconstructed as a dual empire, consisting of a German or 'Cisleithan' monarchy, and a Magyar or 'Transleithan' kingdom. Each of the two countries has its own laws, parliament, ministers, and government, and deals with the affairs exclusively relating to itself. The ministers for affairs common to the whole empire (foreign affairs, finance, army) are not responsible to either parliament, but to the Delegations. The connecting link between the two portions of the empire is constituted by a body known as the Delegations. These form a parliament of 120 members: the one half is chosen by the legislature of Germanic Austria, which is represented by it, and the other half represents Hungary. The person of the sovereign is another link between the two members of the empire. The Magyars claim, under certain conditions, the right of freely electing their monarch. The Delegations have control of all matters affecting the common interests of the two countries, especially foreign affairs, war, and finance; and the ministries of these three departments are responsible for the discharge of their official functions to the Delegations, a committee of which sits permanently. The acts of the Delegations require to be confirmed by the representative assemblies of their respective countries; and in this manner it is attempted to leave the self-government of both Austria Proper and Hungary free. These arrangements were determined by the famous *Ausgleich* or agreement with Hungary in 1867. The govern-

ment has frequently much difficulty in fixing its political and commercial policy so as to satisfy two parliaments with equal powers of control and different views; but the great influence of the crown generally suffices to prevent a dead-lock.

The administration of Austria Proper is divided among seven ministries—Public Education and Ecclesiastical Affairs, Agriculture, Finance, Interior, National Defence, Commerce, and Justice. Formerly the ministry was merely the collective organ of the emperor, and was responsible to him alone. But a bill passed by the Reichsrath in 1867, and sanctioned by the emperor, renders it responsible to parliament.

The Reichsrath consists of an upper and a lower house. The upper house is composed of the princes of the imperial family who are of age, of upwards of 50 nobles, 10 archbishops, 7 bishops, and 105 life-members nominated by the emperor. The lower house numbers 353 members, elected by voters of each country, arranged in the four classes of great proprietors, towns, commerce, and rural districts. In the three first classes the voting is direct; in the last, indirect. To give validity to bills passed by the Reichsrath, the consent of both chambers is required, as well as the sanction of the emperor. Thus the government of Austria is both representative and constitutional.

The executive of Hungary is carried on in the name of 'the king' by a responsible ministry. See HUNGARY.

History.—The empire of Austria arose from the smallest beginnings at the end of the 8th century. In 796 a Margraviate, called the Eastern Mark (i.e. 'March' or frontier-land; see MARK, MARQUIS), was founded as an outpost of the empire of Charlemagne, in the country between the Ens and the Raab. The name *Oesterreich* appears first in 996. In 1156 the mark was raised to a duchy; and after coming into the possession of the House of Hapsburg in 1282, it rapidly rose to a powerful state. The princes of that House extended their dominion by marriage, by purchase, and otherwise, over a number of other states, and from 1438 held almost without interruption the throne of the German empire. By the acquisition (1526) of the crowns of Bohemia and Hungary, Austria rose to the rank of a European monarchy. In 1804 Francis declared himself hereditary Emperor of Austria, and two years afterwards resigned the title of Emperor of Germany and King of the Romans.

In the earliest times, what is now the duchy of Austria was inhabited by the Taurisci, a Celtic people; but their name subsequently disappeared before that of the Norici. After the conquest of the Norici by the Romans (14 B.C.), the country to the north of the Danube belonged to the kingdom of the Marcomanni; on the south of the river lay the Roman provinces of Noricum and Pannonia, in which last was the municipal city of Vindobona (Vienna). Tyrol formed part of Rætia. All these boundaries were swept away by the irruption of the northern peoples; and the regions in question were occupied in succession, during the 5th and 6th centuries, by Boii, Vandals, Goths, Huns, Lombards, and Avars. After the Lombards had settled in Italy, the Ens, about 568, became the boundary between the Bavarians and the Avars. In 796 the armies of Charlemagne destroyed the Avars, and as a bulwark of his empire in that quarter, established the East Mark, which formed the nucleus of the Austrian empire, just as the mark of Brandenburg grew into the modern Prussia. The East Mark was at first of small and varying dimensions. Early in the 10th century it was almost effaced by the Hungarians, then newly arrived in their present seats; but Otto I. having

defeated them in the battle of Augsburg (955), reunited the country to Germany.

In 983 Otto appointed Leopold of Babenberg margrave of the reconquered province, whose dynasty ruled Austria for 260 years. Under Henry Jasomirgott (1141-77), the Mark above the Ens was annexed to the Lower Mark, the united province raised to a duchy, and important privileges conferred on the newly-named duke and his heirs. This Henry Jasomirgott took part in the second crusade; and he was one of the founders of Vienna. Under his successors, large additions (Styria, Carniola) were made to the possessions of the House. Leopold VI. undertook numerous expeditions against the Hungarians and the Mussulmans, and is reckoned the best of the Babenberg princes. The line became extinct with his successor, Frederick, who fell in battle with the Magyars (1246).

Then followed an interregnum from 1246 to 1282. The Emperor Frederick II. at first treated the duchy as a lapsed fief of the empire; but in the distracted condition of affairs, the Estates of Austria and Styria chose Ottokar of Bohemia as duke, who made good his nomination about 1260. Ottokar, refusing to acknowledge Rudolf of Hapsburg as emperor, was defeated, and lost his life and possessions, in the great battle of the Marchfeld (1278); and the emperor elect, as head of the Holy Roman Empire, shortly afterwards (1282) bestowed the vacant fiefs of Austria, Styria, and Carinthia on his sons Rudolf and Albert. These duchies were afterwards united in the possession of Albert.

From the year 1282 the House of Hapsburg has ruled Austria, and has been associated with all its subsequent greatness and vicissitudes. Albert, the first duke of the line, had many difficulties to contend with, especially among his subjects, who insisted on their old privileges, but he energetically asserted his authority. He was murdered in 1308 by his own nephew. Of his five sons, Frederick was chosen (1314) by a party to the imperial throne, but was defeated (1322) by his rival, Louis of Bavaria. Duke Leopold was defeated at Morgarten (1315) in his attempt to reduce the Swiss cantons that had thrown off their allegiance to Albert I. In 1330 Albert II., another of the sons of the first Albert, succeeded to the duchy, and considerably increased the possessions of the House. After his death (1358), two of his sons, Rudolf and Albert III., successively followed in the duchy of Austria. Another son, Leopold, held the other lands, but lost his life at Sempach, in seeking to regain the Hapsburg possessions in Switzerland. The posterity of Albert III. and Leopold respectively formed the two lines of Austria and Styria. During Albert III.'s reign, Tyrol and other districts were ceded to Austria. After his death (1395) the dukedom was held by his son, Albert IV. Albert V., who succeeded his father in 1404, by marrying the daughter of the Emperor Sigismund, succeeded (1438) to the thrones of Hungary and Bohemia, and was at the same time raised to the dignity of German emperor, as Albert II. After his death in 1439, Bohemia and Hungary were lost to the House of Austria; but the imperial dignity was henceforth associated with it. With Ladislaw, Albert's son, the Austrian line of the House closed (1457), and their possessions went to the Styrian line. Of this line was the Emperor Frederick III., who raised the dignity of his House by making Austria an archduchy. Through the death of the other members of the House, Frederick succeeded in uniting the domains of Austria, curtailed, however, by the loss of the family possessions in Switzerland. He was succeeded in 1493 by his son Maximilian I.

The rise of Austria and of the House of Hapsburg to historical eminence may be said to date from the reign of Maximilian I. (1493-1519). By marrying Mary, daughter of Charles the Bold (1477), he acquired possession of the Netherlands. Through the marriage of their son Philip with Joanna of Spain, the Houses of Austria and Spain were united. As Philip died in 1506, his elder son, the celebrated Charles V., became heir to the united monarchies, and was elected emperor of Germany in 1519. Thus, by a succession of fortunate marriages, the House of Hapsburg became the most powerful dynasty in the world. This stage, at least, of Austrian history entirely justifies the well-known line:

*Bella gerant alii; tu felix Austria, nube.**

Charles V., however, resigned all his German territories to his younger brother, Ferdinand I., who was thus the continuation of the Austrian branch of the line. Under Ferdinand the power of Austria greatly increased, for circumstances were now to put her into the dangerous but honourable and finally powerful position of bulwark of Christian Europe against the Turks. Ferdinand had married the sister of Louis, king of Bohemia and Hungary, and when Louis fell in the disastrous battle of Mohacz (1526), he claimed both these kingdoms. His claim to Hungary was contested by John Zapolya, who secured the aid of the great Turkish Sultan Soliman, the victor of Mohacz. Soliman accordingly invaded Hungary with a powerful army, and crushing all resistance, marched as far as Vienna, but failed in his siege of the capital (1529). Only a small part of Upper Hungary remained with Ferdinand, the rest of the country being subject to Turkey till near the close of the 17th century. Even the portion of Hungary that he held was a precarious possession, for which in 1547 he promised to pay an annual tribute of 30,000 ducats. On the abdication of Charles V. (1556), Ferdinand succeeded to the imperial dignity; he died in 1564, with the reputation of a good ruler, one strongly conservative of everything established, though he introduced the Jesuits. During his reign, however, the Reformation had made wonderful progress in the Austrian states.

In the partition of the inheritance that took place among Ferdinand's three sons, the eldest, Maximilian II., received the imperial crown along with Austria, Hungary, and Bohemia; the second, Ferdinand, Tyrol and Upper Austria; the third, Charles, got Styria, Carinthia, &c. Maximilian was more fortunate in Hungary than his father. The death of Soliman before Szigeth (1566) led to a truce; Maximilian had his eldest son, Rudolf, crowned king of Hungary in 1572, and shortly after, of Bohemia, and also chosen king of the Romans. But his attempt to bring the crown of Poland into his House failed. Maximilian II. was fond of peace, tolerant in religion, and a just ruler. He died in 1576; and of his five sons, the eldest, Rudolf II., became emperor. Under him, the possessions of the Archduke Ferdinand of Tyrol, who had married Philippine Welser (q.v.), the beautiful daughter of an Augsburg burgher, reverted to the other two lines, Ferdinand's children not being considered noble. Rudolf II. was negligent, leaving everything to his ministers and the Jesuits. His war with the Porte and Transylvania brought him little credit; and the Protestants of Bohemia, oppressed by the Jesuits, extorted from him a charter of religious liberty. In 1608, he was obliged to cede Hungary, and, in 1611, Bohemia and Austria, to his brother Matthias (q.v.). Matthias, who became emperor in 1612, ceded Bohemia and Hungary to his cousin Ferdinand, son of the

* Let others war; do thou, Austria, make fortunate marriages.

Archduke Charles of Styria, third son of Maximilian II. Matthias lived to see the outbreak of the Thirty Years' War (q.v.), and died in 1619.

Bohemia refused to acknowledge his successor, Ferdinand II. (q.v.), to whom all the Austrian possessions had again reverted, and chose the Elector Palatine, Frederick V., the head of the Protestant Union, as king. This election gave the signal for the Thirty Years' War (q.v.), in which the House of Austria took the lead, both as the champion of Catholicism, and the head of a power which aimed at universal domination in Germany and in the Christian world. The battle of Prague (1620) subjected Bohemia to Ferdinand, who formally set about rooting out Protestantism in that country and in Moravia. The emperor also succeeded in extorting acknowledgment of his sovereignty from the States of Austria; and here, too, Protestantism, which had made great progress since the time of Luther, was mercilessly suppressed. Under Ferdinand's successor, the Emperor Ferdinand III. (1637-1657), Austria continued to be a theatre of war; and at the peace of Westphalia (1648), had to cede Alsace to France. Ferdinand III.'s son and successor, Leopold I., provoked the Hungarians to rebellion by his severity. Tokeli (q.v.) received aid from the Porte, and Kara Mustafa besieged Vienna (1683), which was rescued only by an army of Poles and Germans under John Sobieski hastening to its assistance. After this great deliverance of Vienna, the Turkish power continually declined. In 1686 they lost Buda, after having occupied it for nearly 150 years. Repeated defeats from the Austrian troops under Louis of Baden and the famous Prince Eugene compelled them to submit to the treaty of Carlowitz (1699), by which they were almost entirely cleared out of Hungary, Transylvania, and Croatia, and the Hapsburg dominions nearly advanced to their present frontiers. The struggle between Leopold and Louis XIV. of France for the heirship to the king of Spain, led to the war of the Spanish Succession (q.v.), during which Leopold died in 1705. He was of sluggish phlegmatic character, and wholly under the influence of the Jesuits.

His eldest son and successor, the enlightened Joseph I. (q.v.), continued the war. He died childless in 1711, and was succeeded by his brother, Charles VI. The peace of Rastadt, which concluded the war of the Spanish Succession in 1714, secured to Austria the Netherlands, Milan, Mantua, Naples, and Sicily. In the following years, its power on the Lower Danube was extended by the great victories of Prince Eugene, who completely defeated the Turks, took Belgrade, and compelled them to accept the disadvantageous peace of Passarowitz (1718). But these advantages were lost in a subsequent war, concluded by the peace of Belgrade (1739), when that fortress and other conquests of Eugene were restored to Turkey.

With the death of Charles VI., in 1740, the male line of the Hapsburgs became extinct, and his daughter, Maria Theresa, who was married to the Duke of Lorraine, assumed the government. For many years it had been the aim of Charles to secure the adhesion of the European powers to the Pragmatic Sanction, by which the possessions of the Austrian crown should pass to Maria Theresa. Those powers during his lifetime had promised to second his wishes, but he was no sooner in his grave than nearly all of them sought to profit by the accession of a female sovereign. A great war arose, in which England alone sided with Maria. Frederick II. of Prussia conquered Silesia. The Elector of Bavaria was crowned king of Bohemia, and elected emperor as Charles VII. in 1742. The Hungarians, however, stood by their heroic queen,

who was soon able to wage a fairly successful war against her numerous foes. At the general peace of Aix-la-Chapelle in 1748, the power of Austria remained unbroken, except that it had been obliged to give up Silesia to Prussia, and a few districts of Northern Italy to her rivals there. At the death of Charles VII. in 1745, the husband of Maria Theresa was elected emperor of Germany as Francis I. The empress-queen, however, was not content with the loss of Silesia, and in 1756 entered into alliance with France, Russia, Saxony, and Sweden against Frederick. The result of the Seven Years' War (q.v.), which now ensued, was to confirm Prussia in the possession of Silesia. At Francis's death (1765), his son, Joseph II., became German emperor, and joint-regent with his mother of the hereditary states. Collateral branches of the House of Austria sprang from the younger sons of Maria Theresa, the Archduke Leopold in Tuscany, and the Archduke Ferdinand, who married the heiress of Este (see MODENA). In the first partition of Poland (1772), Austria acquired Galicia and Lodomeria, and the Bukovina was ceded by the Porte in 1777. At the death of the empress in 1780, the monarchy had an extent of 224,000 sq. m., with a pop. of 24 millions, and a debt of 160 million florins. The administration of Maria Theresa was distinguished by unswerving unity and vigour, both in home and foreign affairs.

Her successor, Joseph II., was an active reformer in the spirit of the enlightened despotism of the times; though often rash and violent in his mode of proceeding. He introduced economy into every department, relaxed the censorship of the press, granted liberties and rights to Protestants, abolished a great number of monasteries, and revised the school system. His protective system of duties, though exhibiting his narrowness as a statesman, gave a start to native manufactures. But his reforming zeal and passion for uniformity excited opposition; the Netherlands rose in insurrection, and other disturbances broke out, which hastened his end (1790). He was succeeded in the government by his brother, the Grand-duke of Tuscany—as German emperor, Leopold II.—who succeeded in pacifying the Netherlands and Hungary. The fate of his sister, Marie Antoinette, and her husband, Louis XVI., led Leopold to an alliance with Prussia against France; but he died in 1792 before the war broke out. War was declared by France on his son, Francis II., the same year (see FRANCE). By the treaty of Campo Formio (q.v.), 1797, Austria lost Lombardy and the Netherlands, receiving in lieu the Venetian territory. In 1795, at the second partition of Poland, it had been augmented by West Galicia. Francis, in alliance with Russia, renewed the war with France in 1796, which was ended by the peace of Lunéville. It is needless to follow all the alterations of boundary that the Austrian dominions underwent during these wars. The most serious was at the peace of Vienna (1809), which cost Austria 42,000 sq. m. of territory, and 11 million florins of her revenue. It was in 1804, when Napoleon had been proclaimed emperor of France, that Francis declared himself hereditary emperor of Austria as Francis I. On the establishment of the Confederation of the Rhine, he laid down the dignity of German emperor, which his family had held for nearly four hundred years.

The humiliating peace of Vienna was followed (1809) by the marriage of Napoleon with the Archduchess Maria Louisa; and in 1812 Austria figured as the ally of Napoleon in his great campaign against Russia, but she did not give much active assistance. In August of the following year Austria joined the grand alliance against France;

and the Austrian general, Schwarzenberg, was intrusted with the chief command of the allied forces, which at the battle of Leipzig and in the campaign of 1814 broke the power of Napoleon. The sacrifices and great services rendered by Austria in the gigantic struggle received full consideration at the treaty of Vienna (1815). As recompense for the loss of the Netherlands she received Venice and Dalmatia, which afforded an outlet for her foreign trade.

After that time, Austria exerted a powerful influence in European politics generally, and more especially in the German Confederation, of which her emperor was president; and that influence was uniformly hostile to constitutionalism (see METTERNICH). The death of Francis I. in 1835 made little alteration in the policy of Austria; Ferdinand I. trod in his father's footsteps. The political alliance with Russia and Prussia was drawn closer by a personal conference of the emperor with Nicholas I. and Frederick-William III. at Teplitz in 1835. The wonted calm was interrupted in 1840 by the war against Ibrahim Pasha in Syria, in which Austria took part in union with England.

But during this long peace, the internal condition of the empire was coming to a crisis. The stifling bureaucratic system of government and police supervision had produced only irritation and discontent, and was powerless to compress the fermentation. A Polish insurrection in 1846 led to the incorporation of Cracow with the monarchy. But the opposition to Austrian rule in Italy, Hungary, and Bohemia became uncontrollable; even in Lower Austria the Estates were among the foremost to urge reform in the direction of constitutionalism. In Austria, the revolutionary period of 1848-49 was one of exceptional severity, the movement for constitutional freedom being complicated by the revival of the national spirit in Hungary, Italy, and Bohemia. The time was everywhere ripe for revolt, when the fall of Louis-Philippe (February 24, 1848) gave the signal for the outbreak of the revolutionary elements all over Europe. Nowhere was the spirit of change stronger than in Vienna, which for many months became a scene of confusion. A period of addresses and petitions for liberal reform was, in March, followed by a popular movement in the capital, to which the government and military, after a feeble resistance, succumbed. The downfall of the old system was marked by the flight of Metternich to England, by the arming of the citizens, by the granting of the freedom of the press, and other popular measures. At the same time, the opposition in Hungary had carried their demand for an independent ministry responsible to a national diet, and the emperor was not in a position to withstand it. The 22d of March saw the insurrection break out at Milan, and Radetzky, the military commander, forced to retire on Verona. Venice rose at the same time, and drove out the Austrians. The Austrian power and system of government had in fact broken down.

The central power at Vienna was in a state of collapse, and the authority passed into the hands of the national guards and the students' legion (the *Aula*). Further troubles in the capital led to the flight of the court to Innsbruck. A Slavic insurrection broke out in Prague after Easter, which, however, was repressed with bloody severity by Prince Windischgrätz. While the emperor was lingering at Innsbruck, leaving Vienna in the power of the populace, and the Hungarians were pursuing an independent course, it was in Italy that the power of Austria began to recover ground. Radetzky had at first been reduced to maintain a defensive position at Verona, against the revolutionary forces led by Charles-Albert

of Sardinia. But in the course of the summer he took the offensive against the Sardinians, and defeated them at Custoza. The fruits of the victory were the dissolution of Charles-Albert's army, and a truce which again delivered Lombardy to Austria.

In the meantime, the government at Vienna was more powerless than ever. The emperor remained at Innsbruck, and a constituent diet was opened in July by the Archduke John, as his representative. But order was never permanently restored, and affairs were brought to a crisis by the proceedings in Hungary. Jellachich, Ban of Croatia, refused obedience to the Hungarian government, a course which, while openly condemned, was secretly encouraged by the Austrian court. The Archduke Palatine, Stephen, left Hungary, after a last attempt at conciliation; and the emperor, who had returned to Vienna after repeated invitations, named Count Lamberg commissioner, with the supreme command in Hungary. Lamberg, however, was murdered on the bridge of Pesth (September 28). Though the dissolution of the Hungarian parliament was now declared, it continued its sittings, and appointed Kossuth president of the committee of defence. The leaders of the popular movement in Vienna were in sympathy with Hungary, and when the imperial troops were ordered to suppress the national rising there, the citizens again rose in insurrection. The arsenal was stormed, and the war-minister, Latour, murdered; the court fled to Olmütz, a committee of safety was appointed, the armed populace organised, and the Polish general, Bem, put at the head of military affairs. In the meantime, the military forces had withdrawn from the capital, and joined Jellachich, in order to prevent the Hungarians coming to the aid of the Viennese. Windischgrätz now laid siege to the capital, which surrendered at the end of October, after a resistance of eight days. The reaction was triumphant, and the leaders of revolt severely punished; but as Ferdinand had not shown sufficient vigour in the great crisis, he was persuaded to abdicate, and Francis-Joseph was declared emperor at the age of 18. Thus restored, the central authority had now to assert itself in Hungary and to complete the reconquest of Northern Italy. In the former country, the imperial troops had at first met with great success and retaken the capital, but they could not maintain themselves there. In Italy, Radetzky made his rapid and decisive campaign of 1849, and, by the victory of Novara, completed the overthrow of Sardinia. With the surrender of Venice, which took place in August, the subjugation of Italy was complete. At the same time, in the National Assembly at Frankfurt, Austria opposed the project of a confederation of states under the leadership of Prussia, and managed to thwart the conferring of the empire of Germany on the Prussian king.

In Hungary, the Magyars, though the Germans and Slavs within the country itself were hostile to them, began the campaign of 1849 with decided success. Bem conquered Transylvania. These and other successes encouraged Kossuth to proclaim the deposition of the House of Hapsburg, and the re-establishment of Hungary as a separate state. Buda was retaken from the imperial troops, which were driven back on Presburg. But the government had already solicited the aid of Russia, whose armies, entering Transylvania and Hungary, added to the imperial cause the irresistible weight of numbers. Surrounded on every side by superior forces, the Hungarians were completely beaten. It was in vain that Kossuth transferred the dictatorship to General Görgei (q.v.). Görgei, whether from treachery, as the other Magyar leaders maintained, or from necessity, as he himself averred, laid down

his arms to the Russians at Vilagos (August 13). The surrender of Komorn, in September, completed the subjugation of Hungary, which was treated as a conquered country.

The ten years which followed on the revolutionary troubles of 1848 were a period of reaction and of absolutism. A constitution which had been granted in 1849 was soon annulled. The policy pursued was one of strong centralisation under a bureaucratic government, by which the claims of nationality and of freedom were alike disregarded. Liberty of the press and trial by jury were set aside. A rigorous system of police was maintained. The aim was to Germanise the whole empire and to crush the aspirations of both Slavs and Hungarians. As the Catholic Church pronounced against national freedom, and supported the central authority, it received the greatest privileges by the Concordat of 1855. The result of all these proceedings was only to irritate the national feeling in Hungary, Italy, and Bohemia. The finances, too, notwithstanding vigorous measures for improving the material resources of the country, continued in a bad state, so that incessant loans were required to cover the current deficit.

On the confused arena of German politics, the struggle for ascendancy was kept up between Austria and Prussia. In 1850 the two powers were armed and ready to come to blows with reference to the affairs of Hesse-Cassel (q.v.); but the bold and determined policy of Schwarzenberg prevailed, and by the humiliating arrangement of Olmütz, Prussia gave way (see GERMANY). For a few years longer the preponderance of Austria in the German Confederation was secured.

During the Crimean war, Austria had a very difficult part to play. It felt its indebtedness on the one hand to Russia for help in the great crisis of 1849, on the other it could not without uneasiness see the development of Russian power in the Balkan Peninsula. It occupied the Danubian principalities with the consent of Turkey, but otherwise remained neutral in action. Yet its whole influence was thrown into the scale against Russia. The Crimean war was not brought to a termination without disclosing a power which was to break the Austrian domination in Italy. Under the leadership of Cavour, Sardinia had taken part in the war, and had again brought the Italian question to the front. The rule of Austria in Italy had always been unsatisfactory. From her own provinces in Venice and Lombardy she controlled the policy of the courts of Central and Southern Italy, and her influence tended invariably towards the suppression of national feeling and popular liberty. Sardinia was the only state that worthily represented the spirit of the Italian people. In the spring of 1859 it began to arm against Austrian supremacy. Austria demanded immediate disarmament, on pain of war; but Sardinia refused. Austria accordingly commenced hostilities by crossing the Ticino at the end of April 1859. Sardinia having secured the aid of France, the Austrians were defeated, and their emperor was fain to conclude an armistice with Napoleon. On the 12th of the same month, the two potentates met at Villafranca, and concluded a peace, the chief condition of which was the cession of Lombardy to Sardinia (see ITALY). Venice was all that remained of the Italian possessions of Austria.

The rivalry of Prussia and Austria for influence in the Germanic body of states dated from the rise of Prussia to be a leading power. The arrangement of Olmütz in 1850 had left a painful feeling of humiliation in the minds of the Prussian statesmen. The long rivalry was now to be brought to a decisive issue. In 1864 the combined Prussian and Austrian forces drove the Danes out of Sles-

wick-Holstein, but the two victors quarrelled about the subsequent arrangements. War was declared, and in 1866 the Austrian armies in Bohemia were completely beaten by the Prussians, in a campaign of seven days, which closed with the great defeat of Königgrätz or Sadowa. The middle states of Germany which supported Austria were occupied by Prussia. Sardinia, which had formed an alliance with Prussia, was, however, defeated at Custoza. The result of the contest was to exclude Austria from Germany, and she had to hand over to Sardinia the province of Venetia, a cession by which she was also excluded from Italy. Thus was Austria finally shut out from the scenes where for generations she had not unsuccessfully striven to uphold her supremacy. The sphere of development remaining to her was to be found in her own circle of states and in the East.

Since the great war of 1866, the history of Austria has been concerned chiefly with two important interests. In the first place, the government had to attempt an arrangement of the conflicting claims and rights of the peoples constituting the empire; in the second place, it has had to establish working relations with the great neighbouring powers, Germany and Russia, and especially with the latter on the Eastern Question. After the collapse of 1866, the most enlightened Austrian statesmen saw that the true policy of the empire could no longer consist in repressing national claims and constitutional freedom. During the last war, the feeling in Hungary had been lukewarm, and even actively hostile to Austria. The Saxon Count Benst, who was now called to be the head of the Austrian foreign office, advised that an understanding with Hungary was essential. The same policy found a firm and judicious advocate in Francis Deak, an influential Hungarian. The political independence of Hungary was recognised; and the emperor was crowned king at Pesth in accordance with the old historic rites (1867). Soon thereafter he sanctioned the decisions of the Hungarian Diet concerning the relations of the kingdom of Hungary with the other countries of the empire. Such was the famous *Ausgleich*, or agreement between Hungary and Austria Proper, which has since been in force, and on the whole has worked very well. It has at least been a great improvement on the previous condition of chronic ill-feeling on the part of Hungary. Within the territories of Austria Proper there has been a large development of constitutional freedom. At the end of 1867, the first parliamentary ministry in Cisleithania was formed. The Concordat was set aside. Education was freed from the control of the Catholic Church. Marriage was placed under the jurisdiction of the civil power. The press laws were relaxed. Finally, the Prussian system of military organisation was introduced. In Austria itself, however, there are national claims which have not, as in the case of Hungary, been satisfied. Bohemia especially has insisted on its old historic rights, but without success; for besides other reasons, the question is complicated by the presence of about two million Germans on Bohemian soil. The Slav element in Austro-Hungary, which is so large, which is partially discontented and more or less disposed to look towards Russia as the head or centre of their race (see PANSLAVISM), is an admitted source of weakness and danger to the empire. Some of her statesmen have advocated a system of Federalism as the only method of reconciling the diverse national claims with the existence of the empire. The attempt to realise it in 1871 failed, owing to the opposition of the Germans and Magyars.

In the foreign affairs of Austria, the chief aim has been to find a *modus vivendi* with Germany

and Russia. Since 1871 an informal alliance has subsisted between the empire and Germany; and the participation of Russia constituted for a time an 'Alliance of the three Kaisers.' But the Eastern Question is a continual source of difficulty between Russia and Austria. In the Russo-Turkish war of 1877-78, Austria's difficulties were aggravated by the strongly expressed sympathy of the Magyars with the Turks; and the development of Russian schemes in Bulgaria further strained relations. Bismarck gave Austria the support of Germany by a formal but secret alliance, concluded in October 1879, which was published only in February 1888, when military movements in Russia, with defensive measures in Germany and Austria, were pointing to the likelihood of war. The treaty bound Austria and Germany to regard an attack by Russia on either state as an attack on itself.

Since the exclusion of Austria from the Italian Peninsula, her relations with the new kingdom have generally been harmonious, in spite of the question of the *Italia Irredenta* (q.v.). Her true sphere of action is now recognised to lie in the south-east, in the valley of the lower Danube, and in the Balkan Peninsula. But for the efficient fulfilment of this great mission she is not a little weakened by the conflicting claims and interests of the nationalities that exist within her borders. Till they are reconciled, the position of the Austro-Hungarian empire must be regarded as unstable and uncertain.

As reference to an earlier paragraph will show, in the dual monarchy there are in round numbers ten millions of Germans, six millions of Magyars, sixteen of Slavs, three of Roumans, and one and a half millions of Jews; and each of these races hates and distrusts one or more of the others. The bitterness is keenest between Germans and Czechs, Magyars and Slavs of Hungary, Magyars and Roumans. The multiplicity of races and their mutual jealousies render the task of the central government delicate and difficult; but it is in another way a source of strength for the monarchy. The principal races are so scattered over the area of the empire that joint action on the part of any one of them is impossible; thus the northern Slavs are separated from their brethren in the south. Each stock has a special affinity for a foreign power: the Germans for the empire of Germany, the Czechs for Russia, the southern Slavs for Serbia, the Roumans for Roumania. Each race in the Austrian empire would, if it tried to stand alone, be crushed by its rivals within the monarchy, or absorbed by the surrounding powers. The supreme condition of safety is that the various races of Austria should cling closely together in danger, and should find their best bond of defence in the 'personal' union under the emperors of the House of Hapsburg. And in spite of its lack of genius and generosity, its political blundering and frequent defeat in war, that dynasty has not seldom experienced the most devoted loyalty from the various races composing the empire.

For geography and statistics, see works by Brachelli, Hannak, Traupler, Umlauf, Klun, Strahalm, and D. Kay (Lond. 1880); for the history, *Léger's Histoire de l'Autriche-Hongrie* (Par. 1879; Eng. trans. 1888), *Coxe's History of the House of Austria*, and works by Schneller, Meilath, Lichnowsky, Mayer (1874), Kroner (1879).

Austria, ARCHDUCHY OF, the cradle and nucleus of the Austrian empire, lies on both sides of the Danube, from the mouth of the Inn to Presburg, on the borders of Hungary, and embraces an area of 18,052 sq. m., with a pop. of nearly 3,300,000. It now forms three of the crownlands, or administrative provinces of the empire—viz. Lower and Upper Austria (i.e. Austria below, and Austria above, the Ens), and the duchy of

Salzburg (see preceding article; also SALZBURG). The south and west portions are mountainous; the north and east are more level and fertile, containing the great plain of Vienna, the Marchfeld, &c. The population is mostly German and Catholic. The chief towns, besides Vienna, are Wiener-Neustadt, Salzburg, Steyer, Linz, and Ischl.

Auteuil, formerly a country village at the entrance of the Bois de Boulogne, now inclosed within the fortifications of Paris. It is known as the residence of famous literary men—such as Boileau and Molière.

Autochthones, the Greek name for the original inhabitants of a country, not settlers, considered as having sprung from the soil itself. The Athenians were fond of being so called; the ancients counted among autochthonous races also the Arcadians, Latins, Gauls, and Scythians. The Latin equivalent term was *aborigines*.

Autocracy (Gr., 'sole mastery,' 'ruling by one's self') signifies that form of government in which the sovereign unites in himself the legislative and the executive powers of the state, and thus rules uncontrolled. Such a sovereign is therefore called an autocrat. Nearly all eastern governments are of this form. Among European rulers, the emperor of Russia alone bears the title of Autocrat, the name indicating his freedom from constitutional restraint of every kind. Such is the theory or principle of an autocracy, but it should be remembered that even the most rigorous autocrat must in practice have regard to the feelings and opinions of those about him. There are real though not formal checks. In autocratic states, palace or court revolutions are not infrequent. This has been a marked feature of Russian history, especially in the 18th century. These revolutions often result in the deposition and assassination of the sovereign. In point of fact, the peculiar feature of an autocracy is the absence of regular and constitutional limits; it is a strong form of 'personal rule.' See ABSOLUTISM.

Auto da Fé (Port., 'act of the faith'; Span. *Auto de Fé*) was the name given to the solemnity that from 1481 used to take place in Spain and Portugal at the execution of heretics condemned to death by the Inquisition. It was generally held on a Sunday between Whitsunday and Advent, very often on All-Saints' Day. At dawn, the dismal tolling of the great bell of the church gave the signal to begin the drama of the day; for as such it was looked upon by the people, who thronged to it in troops, believing that they did a good work in merely looking on. Men of the highest rank reckoned it prudent to give their countenance to the 'holy' tribunal at these processions, and even grandees of Castile did not disdain to make themselves familiars of the Inquisition. The procession was led by the Dominicans, carrying the flag of the Inquisition; next followed the penitents, on whom only penance had been laid; behind them, and separated by a great cross which was borne before, came those condemned to death—barefoot, clad in robes painted with hideous figures called the Sanbenito, and with a pointed cap on the head; then, effigies of fugitives; and lastly, the bones of dead culprits, in black coffins painted with flames and hellish symbols. The frightful train was closed by an army of priests and monks. The procession went through the principal streets to the church, where, after a sermon on the true faith, the sentence was announced, the accused standing meantime before a crucifix with extinguished torches in their hands. After the sentence had been read to them, an officer of the Inquisition gave each of the condemned a blow on the breast

with his hand, as a sign that they were given over by that tribunal to the secular power; on which a secular officer took them in charge, had them fettered, and taken to prison. A few hours afterwards, they were brought to the place of execution. If they yet, at the last, made profession of the Catholic faith, they were so far favoured as to be first strangled; otherwise, they were burned alive, and with them the effigies and bones of the fugitive and dead culprits. As a rule, the king, along with his whole court, had to exalt by his presence the solemnity of the horrid transaction. The most splendid auto da fé took place at Madrid, under Charles II., in 1680; and so late as 1826 a Jew and a deistical schoolmaster were, the one burned, the other hanged, under the forms of an auto da fé, at Valencia. See INQUISITION.

Autograph (Gr.), something written in a person's own handwriting, and not by an amanuensis, whether a mere signature or a whole manuscript, as opposed to a copy. From the 16th century onwards, but especially in modern times, the collection of autographs has become an object of eager pursuit; and consequently since 1801 they have formed a branch of literary trade. The value of autographs is determined by the interest felt in the writer, the scarcity of such relics of him, and the contents of the writing. Besides portraits of famous persons, we naturally wish to possess a specimen of their handwriting, as the peculiarity of the style—the physiognomy of the handwriting—completes our knowledge of their personality. In 1858 a signature of Shakespeare was purchased by the British Museum for 300 guineas; whilst at the Joy sale in 1887 a letter of Defoe's, indorsed by Sir Walter Scott, fetched £65. Lithography is particularly serviceable in this matter, not only by supplying fac-similes for biographical and historical works and for portraits, but also by multiplying impressions of collected autographs. Such have been published in England by Nichols (1829), and in Germany by Wasmuth (1885). But deserving mention before all others are the *Isographie des Hommes Célèbres* (4 vols. Paris, 1843); the collection of French autographs by Delpech (1832), and of German by Schlottmann (3d ed. 1858). There have been works published containing the sign-manuals of distinguished musicians, of the great poets, &c. Forgeries of autographs are not infrequent. All Europe took a lively interest in the autographs of the most eminent men of all times from Cæsar downwards possessed and partly published by M. Chasles, until in 1867 that eminent mathematician had to own he had been duped by a forger. See Fontaines, *Manuel de l'Amateur d'Autographes* (1836); and Günther and Schulz, *Handbuch für Autographensammler* (1856). Charavay started in 1862 a periodical called *L'Amateur d'Autographes*; and List and Francke in 1884 the monthly *Mitteilungen für Autographensammler*.

Autogravure, a peculiar process of photo-engraving patented by J. R. Sawyer, London, on November 12, 1884. If an ordinary autotype carbon print be placed on silvered copper instead of on paper, the slight relief which the picture possesses is enough to admit of an Electrotpe (q.v.) being taken from it. The raised parts of the print become the depressed parts in the electrotpe. The latter can therefore be used for taking impressions from in the same way as an engraved copperplate. See PHOTOGRAPHY, AUTOTYPE.

Autolycus, (1) a son of Hermes, maternal grandfather of Ulysses. He lived on Mount Parnæus, and was famous for his cunning and robberies; similarly, in Shakespeare's *Winter's Tale*, Autolycus is a 'snapper-up of unconsidered trifles.' A 'literary Autolycus' is a plagiarist.—

(2) A Greek astronomer and mathematician of Pitane in Æolia, about 330 B.C., who wrote two works, on the revolving sphere, and on the rising and setting of the fixed stars.

Automatism (Gr., 'self-movement'), a term applied to the power of initiating vital processes from within the cell, organ, or organism, independently of any direct or immediate stimulus from without. External conditions produce effects within the living matter which may lie dormant for a time, and only subsequently find expression in activities without apparent external stimulus. The heart of a cold-blooded animal like a tortoise may be isolated from the body without interrupting the beat, which will indeed, in certain conditions, continue for days; the conditions of its activity are contained within itself—it is automatic. The highest form of automatism is that exhibited in the will of man and the higher animals—they can act without direct interference from without. But the word, applied to animal life, is often used of that which is involuntary and merely mechanical; especially indicating the Cartesian doctrine, that animals (other than man) are like automata, mere machines, without either the vegetative or sensitive soul allotted to them by Aristotle. See PHYSIOLOGY, NERVOUS SYSTEM, LIFE.

Automaton is derived from two Greek words signifying self-movement, and is usually applied to machinery constructed to represent human or animal actions; 'automatic' used of an apparatus, implies that it does its work with little or no guidance or interference from man, as in a telegraphic 'automatic transmitter.' The construction of automata has occupied the attention of mankind from very early ages. Archytas of Tarentum is reported, so long ago as 400 B.C., to have made a pigeon that could fly. Hero of Alexandria describes in his book upon pneumatics a number of automatic contrivances which depend upon well-known principles. Other ancient writers record similar devices; but it is difficult to understand how these could have been made at a time when technical knowledge was at a low ebb. Many of them doubtless were simple tricks to impose upon the superstitious and credulous. One of the most perfect automata was one constructed by M. Vaucanson, and exhibited in Paris in 1738. It represented a flute-player, which placed its lips against the instrument, and produced the notes with its fingers in precisely the same manner as a human being does. In 1741 M. Vaucanson made a flageolet-player, which with one hand beat a tambourine; and in the same year he produced a duck. This was a most ingenious contrivance, the mechanical duck being made to conduct itself in every respect like its animated pattern. It swam, dived, ate, drank, dressed its wings, &c. as naturally as its live companions; and, most wonderful of all, by means of a solution in the stomach, it was actually made to digest its food! Brewster says of this duck 'that it was perhaps the most wonderful piece of mechanism that was ever made.' This statement is qualified by Robert Houdin, the celebrated conjuror, into whose hands Vaucanson's 'duck' was placed for repair. He found that the so-called 'digestive process' was brought about by a vulgar trick altogether unworthy of its author, who was without doubt a clever mechanician. M. Droz, a Swiss, made for the king of Spain a sheep that bleated, and a dog which guarded a basket of fruit. If any of the fruit was taken away, the dog barked incessantly until it was replaced. He also made a singing-bird, which was ultimately quite eclipsed by another made by Maillardet.

The 'Piping Bullfinch,' first exhibited at the London Exhibition of 1851, was a very perfect example of those automata which imitate the movement and song of birds. This piece of apparatus was a box of the size of a large snuff-box. Upon touching a spring, a tiny bird sprang from it, fluttered its wings, and trilled the true pipe of the bullfinch. The sound in reality came from the box, which contained a small pipe which could be shortened and lengthened by the action of a piston, so as to give different notes. It was controlled by a lever, which was actuated by studs on a small clockwork barrel, the necessary wind being furnished by bellows. It was indeed a very elaborate adaptation of the same principle which actuates the mechanical cuckoo in the well-known Swiss clocks. And in this connection, famous complicated clocks like that in the cathedral of Strasburg deserve mention.

Most of the automata which draw or write have probably been adaptations of the pantograph principle, and have in recent years been eclipsed by the writing telegraph of Mr E. A. Cowper. This, of course, is not an automaton, but it is mentioned here as a marvellous proof of what can be accomplished by electrical means. The system was worked for some months on the South-western Railway, between Waterloo and Woking stations, a distance of 26 miles. Messages written at one of these stations were reproduced in the handwriting of the operator at the other. Houdin, the famous conjurer, made a writing and drawing automaton, which made a great sensation when exhibited in Paris. It was set in motion by clockwork. Faber's talking machine, exhibited in various cities some years ago, has been classed among celebrated automata; but it has no claim to this distinction, for it was worked by keys and pedals. It very imperfectly reproduced speech by mechanical means. Kempelen's chess-player was long regarded as an automaton, but it is now known that a crippled officer—a famous chess-player—was concealed within the figure, and that he used this means to escape from Russia, where a price had been set upon his head.

Of late years all previous efforts in the making of automata have been surpassed by Mr J. N. Maskelyne, who may truly be said to have commenced a new era. The first one, 'Psycho,' was introduced to public notice in January 1875. This is a seated figure of light construction. During performance it is doubly insulated by being placed on a glass cylinder, which stands upon a small movable platform, furnished with porcelain castors. This arrangement at once negatives the idea that it may be worked by electricity. The figure moves its head, and from a rack in front of it chooses the cards necessary for playing a hand at whist, which it plays in a masterly manner. It will also work out calculations up to 100,000,000, showing the entire total of each calculation in a box in front by opening a sliding door. It acts without any mechanical connection with anything outside it, and yet is so much under control that it executes all orders intelligently. The nature of this control is so secret that, although Mr Maskelyne's assistants are aware that certain operations produce certain results, they are quite ignorant as to the principle upon which the automaton works. Zoe (1877) is another automaton which owes its creation to Mr Maskelyne's ingenuity. This is also a sitting figure—insulated, and having no mechanical connection with anything else. During performance there is placed in front of it a sheet of drawing-paper, upon which it traces the likeness of any public character which may be chosen by the spectators from a list of 200 names. Mr

Maskelyne has also constructed other automata, which play upon musical instruments, and perform other surprising feats. The principles involved in their construction are secret. See PNEUMATICS, HERO OF ALEXANDRIA; Brewster's *Letters on Natural Magic*; Houdin, *Secrets of Conjuring*; *Memoirs of Houdin*; Hutton's *Mathematical Recreations*.

Autonomy (Gr., 'self-legislation') is the arrangement by which the citizens of a state manage their own legislation and government; and this evidently may, with certain restrictions, be the case also within limited bodies of the same people, such as parishes, corporations, religious sects. These districts or communities may be autonomous, if not absolutely, yet within certain defined limits. They may be said to enjoy a partial, limited, or local autonomy. Autonomy is often used to designate the characteristic of the political condition of ancient Greece, where every city or town community claimed the right of independent sovereign action. Recently the word is more specifically used of territories or provinces, which, while subject in some matters to a higher sovereignty, are autonomous in other respects. Thus the Treaty of Berlin made Eastern Roumelia an 'autonomous province'; though subject to the direct political and military authority of the sultan, it was to have 'administrative autonomy' in all its internal affairs. Egypt possesses a higher autonomy. The self-government enjoyed by the British colonies may be described as a modified form of autonomy; so also the Home-rule claimed by Ireland. But these are not usual applications of the word.

Autoplasty (Gr., lit. 'self-formed'), a mode of surgical treatment which consists in replacing a diseased part by means of healthy tissue from another part of the same body. The most familiar instance is the Rhinoplastic or Taliacottian operation, for supplying a new nose from the skin of the forehead.

Autopsy (Gr., 'seeing for one's self'), eye-witnessing, a direct observation; but generally used of a Post-mortem (q.v.) examination or dissection of the dead body.

Autotype. In this process, a sheet of paper coated with a film of bichromatised gelatine, in which lampblack or other permanent pigment has been held in solution or suspension, is exposed to the action of light, in a printing-frame, beneath an ordinary photograph negative. In proportion as the light is admitted to the gelatine film or 'tissue,' through the negative, it becomes hardened and insoluble in water. The print is afterwards treated by washing away the unaltered portions of the film, and the result is a permanent print of the object photographed. The process is admirably adapted for the reproduction of oil-paintings; and the enormous series of autotypes from the chief works in all the great public galleries of Europe, published by the Messrs Braun of Dornach, near Mülhausen, are unrivalled in this direction. The process has also been successfully employed for the reproduction of drawings; but where the work to be copied has a perfectly dead surface—as is the case, for instance, with charcoal sketches—the slight gloss possessed by the autotype print is a disadvantage. This objection is still greater in the reproduction of engravings and etchings; and for these the heliogravure process of M. Amand Durand of Paris is preferable, as here a metal plate is prepared by the aid of photography—more or less supplemented by retouchings by the hand with burin or etching-needle—and can be printed in ink and upon paper exactly similar to those of the original engraving or etching which is being copied. Autotypes, and

also heliogravures, can be printed with a margin, without mounting; a great advantage when book illustrations are required, as mounted photographs never preserve a perfectly flat surface, but, with the slightest change of temperature, warp the paper to which they are attached in a most unsightly manner. See PHOTOGRAPHY.

Autumn, the third season of the year, between summer and winter. Astronomically, in the northern hemisphere, it begins at the autumnal equinox, when the sun enters Libra, 22d September, and ends at the winter solstice, when the sun enters Capricorn, 21st December; but popularly, in Great Britain, it comprises the three months, August, September, and October. According to Littré, it extends in France from the end of August to the first fortnight of November; according to Webster, in North America it includes the months of September, October, and November. In the southern hemisphere it corresponds in time to the northern spring.

Autun, a town in the French department of Saône-et-Loire, in the Burgundian district of Autunois, situated on the river Arroux, 31 miles NW. of Chalon by rail. It is the seat of a bishop, and has a fine cathedral (12th century, restored 1865), college, museum, and library, and many ruins of Roman temples, gates, triumphal arches, and other antiquities. Cloth, carpets, and velvet are manufactured, and there is an active trade in horses, corn, and wood. Autun was the ancient *Augustodunum*, and has been by many identified with the earlier *Bibracte*, the chief city of the *Ædui*, though it seems more likely that the site of the latter was Beauvray, 10 miles distant. Under the Romans it became a famous school of eloquence. It was destroyed by Tetricus in 270 A.D., but was rebuilt by Constantine the Great. It was burned and pillaged by the Vandals in 406, Burgundians in 414, Huns in 451, Franks in 539, and Saracens in 739, and nearly destroyed by the Normans in 895. In 1379 it was burned by the English. At the Council of Autun (1094), King Philip I. was excommunicated for divorcing his queen, Bertha. The famous Talleyrand was bishop of the diocese, and here Macmahon was born. Pop. (1886) 13,194.

Auvergne, a southern central district of France, was before the Revolution a separate province, and coincided nearly with the modern departments of Cantal and Puy-de-Dôme. Auvergne falls naturally into two divisions—Upper Auvergne, to the south, rugged and mountainous; and Lower Auvergne, to the north, some parts of which, especially on the left bank of the Allier, are distinguished for extraordinary fertility. The climate is subject to violent extremes and great storms, cold in the mountainous districts, whilst in the plains the heat of summer is often oppressive. Not only do the cone and dome-like shapes of the summits betray a volcanic formation, but also the great masses of basalt and trachyte that break through the crust of granite and gneiss, render it manifest that this was a great focus of volcanic action at a comparatively recent period. Among the summits that have apparently been at one time volcanoes, the most remarkable are Cantal (6093), Mont-Dore (6188), and Puy-de-Dôme (4806): all are now covered with verdure. The lava-covered plateaus are desert, but the pulverised volcanic earths that cover the slopes and valleys form a rich and fruitful soil. Agriculture is in a rude and backward condition; but the breeding of cattle, especially of mules, is diligently carried on. Auvergne produces iron, lead, copper, and coal, and is rich in valuable mineral springs, both cold and hot.

The Auvergnats are a highland people, rude and ungainly, poor, ignorant, and, though of southern temperament, laborious. They are probably the almost unmixed descendants of the ancient inhabitants of this part of Gaul, and speak a dialect of their own. Large numbers of them go to service in Paris and other northern towns, where they are marked by their pronunciation. Auvergne has, however, produced distinguished men, such as the Arnauld family, Lafayette, and Polignac. The chief towns are Clermont and Aurillac (q.v.). The country derived its name from the Celtic *Avern* or *Arverni*, who long defended their fastnesses against Cæsar, as later against the Goths, Burgundians, and Franks. Long a separate county, it was not incorporated with France till 1531.

Auxerre (anc. *Autisiodorum*), the chief town of the French department of Yonne, stands on the river Yonne, 109 miles SE. of Paris by rail, in a rich district abounding in vineyards. It is poorly built, but presents an imposing aspect from a distance, the most prominent feature being the noble Gothic cathedral, which dates from 1215, but was not completed till the 16th century. There are two other interesting churches, a museum, a large library, statues of Fourier and Davout, &c. Auxerre was a flourishing town before the Roman invasion of Gaul. It was destroyed by the Huns in 451, and in 486 was wrested by Clovis from the Romans. The county of Auxerrois came finally in 1477 to the kingdom of France. The principal manufactures are wine (a light Burgundy), candles, chemicals, and hosiery. Pop. (1886) 16,754.

Auxonne, a fortified town in the French department of Côte d'Or, on the left bank of the Saône, 20 miles SE. of Dijon. It has a 14th-century church, a 16th-century castle, and a statue (1857) of Napoleon I. Pop. 5500.

Ava, a ruined city of Burmah, of which it was the capital from 1364 to 1740, and again from 1822 to 1838. It stands on the left bank of the Irawadi, about 6 miles to the SW. of Amarapura. Ava now is almost a desert, its temples and houses having been reduced to ruins by an earthquake in 1839. On the opposite bank stands Sagaing, which has twice been the seat of government.

Ava, Arva, Yava, or KAVA (*Piper methysticum*), a plant of the natural order Piperaceæ (q.v.), possessing narcotic properties. Until recently, it was ranked in the genus *Piper* (Pepper). It is a shrubby plant, with heart-shaped, acuminate leaves, and very short, solitary, axillary spikes of flowers. It is a native of many of the South-sea islands, where the inhabitants intoxicate themselves with a fermented liquor prepared from the upper portion of the root and the base of the stem. The rhizome is thick, woody, rugged, and aromatic. The intoxicating liquor is prepared by macerating it in water. The savage Tahitians were accustomed to prepare it in a very odious manner; much as the Indians of the Andes prepare *Chica* or Maize beer—chewing the root, depositing it in a bowl, straining through cocoa-nut husk, and mixing with water or cocoa-nut milk. As the beverage was drunk immediately afterwards, no fermentation could have taken place, and the narcotic property is therefore ascribed to an acrid resin, *Kawine*, which is present in the root. For an account of the manufacture of the beverage, see Mariner's *History of the Tonga Islands*. The taste is unpleasant to those unaccustomed to it, and has been likened to that of rhubarb and magnesia. The intoxication is not like that produced by ardent spirits, but rather a stupefaction like that caused by opium. It is succeeded by a copious perspiration. The habitual use of ava causes a whitish scurf

on the skin, which, among the heathen Talitians, was reckoned a badge of nobility, the common people not having the means of indulgence requisite to produce it. Ava is, like cocaine, a local anæsthetic.

Avalanches (Fr., from *aval*, 'to descend') are masses of snow or ice that slide or roll down the declivities of high mountains, and often occasion great devastation. They have various names, according to their nature. Drift or powder avalanches (Ger. *Staub-lawinen*) consist of snow, which, loose and dry from strong frost, once set in motion by the wind, accumulates in its descent, and comes suddenly into the valley in an overwhelming dust-cloud. Avalanches of this kind occur chiefly in winter, and are dangerous on account of their suddenness, suffocating men and animals, and overturning houses by the compression of the air which they cause. Another kind of avalanche resembles a landslide. When the snow begins to melt in spring, the soil beneath becomes loose and slippery; and the snow slides down the declivity by its own weight, carrying with it soil, trees, and rocks. The greatest danger is where elevated tracts of moderate declivity are separated from the valleys by precipitous walls of rock; the softened snow of spring beginning to roll or slide on these slopes, is hurled over the precipices with fearful force into the valleys. The very wind caused by them prostrates forests and houses. Ice avalanches are those that are seen and heard in summer thundering down the steepes—e.g. of the Jungfrau. They consist of masses of ice that detach themselves from the glaciers in the upper regions. They are most common in July, August, and September. Nine great Alpine avalanches, which cost 447 lives, are on record between 1518 and 1879, the most destructive being one of 1827, which swept away half the village of Biel, in the Upper Valais, with 88 inhabitants. Sudden avalanches, larger or smaller, constitute one of the special dangers of Alpine climbing. See Coaz, *Die Lawinen der Schweizeralpen* (Bern, 1881). See GLACIER, ICE, ALPINE CLUB.

Avallon (anc. *Aballo*), a town of the department of Yonne, France, 26 miles SE. of Auxerre, on a steep hill of red granite, nearly surrounded by the river Cousin. Avallon is a very ancient town, of Celtic origin, and has been often besieged and taken. The church, in Burgundian Gothic, dates from the 12th century. Pop. 5500.

Avalon, the earthly paradise of Celtic mythology, a 'green island' far to the westward where the sun-god seems to sink to his rest. Thither came heroes like the mighty Fioun and the great Arthur, and there they continued to live. Here were the mystic fountain, the apples (*avlan*) with their strange magical properties, and the mighty smith who forged 'Duré Entaille' for Arthur. The name was applied in the chivalrous poetry of the middle ages to the region where the fairy Morgana holds her court, and afterwards by rationalising historians to the Isle of Saints—an islet in the river Bret in Somersetshire—famous in romantic British history as an abode of Druids and the place to which Arthur was carried to get healed of his wounds.

Avalon, a peninsula forming the eastern part of Newfoundland (q.v.), in which St John's, the capital, is situated.

Avanturine. See AVENTURINE.

Avars, a tribe of Tatar origin, who made their appearance a hundred years later than the Bulgarians, in the countries about the Don, the Caspian Sea, and the Volga. One part of them remained in the Caucasus, another part pressed

forward (about 555 A.D.) to the Danube, and settled in Dacia. Here they served in Justinian's army, and assisted the Lombards to overturn the kingdom of the Gepidæ; and, about the end of the 6th century, under the mighty Khan Bajan, they conquered Pannonia. Later, they mastered Dalmatia; made devastating incursions into Germany and Italy; and extended their dominion over the Slavs living on, and northwards from, the Danube, as well as over the Bulgarians as far as the Black Sea. These nations at last rose against them, and in 640 A.D. drove them out of Dalmatia. Confined to Pannonia, they were subdued by Charlemagne, and well-nigh extirpated by the Moravians, so that after 827 they disappear from history. They usually surrounded their settlements with fortifications of stakes driven into the ground, and earth, of which traces, under the name of Avarian Rings, are yet found in the countries formerly occupied by them. The results of recent criticism show that, in all probability, the Avars belonged to the same great Turanian stock as the Huns, and that their original residence was the land lying east of the Tobol, in Siberia.

Avatar (Sanskrit, *avatāra*) signifies primarily a descent, but is specially applied to the descent of a Hindu deity upon the earth in a manifest shape, either for beneficent or for retributive ends. It is thus almost synonymous in its signification with the Christian term 'incarnation.' The word is sometimes rhetorically employed in English literature as equivalent to manifestation or phase. The ten avatars of Vishnu (q.v.) are the most famous in Hindu mythology.

Avatcha, a bay on the east coast of Kamchatka, by far the best harbour of the whole peninsula, and containing within it the smaller bay on which stands the capital city of Petropaulovsk (q.v.). Avatcha Bay is one of the finest harbours in the world, and is surrounded by superb scenery. The name is also given to two volcanoes lying to the north—one (Govāljaja Sopka) 8500 feet high; the other (Koryātskaya Sopka) 10,000 feet high.

Avebury, or ABURY, a small village of Wiltshire, 6½ miles W. of Marlborough. It is remarkable as the site of the largest megalithic structure in Britain, and as having in its neighbourhood several barrows and cromlechs of remote antiquity. A large outer circle, occupying a flat area of ground on the south of the Kennet, a diminutive tributary of the Thames, consists, or rather consisted, of a hundred large blocks of stone, placed on end in a circular form, around a level area 330 yards in diameter, bounded by a deep ditch and a high embankment. There are also remains of two smaller stone circles within the inclosure, one consisting of two concentric circles of 43 upright stones, with a menhir, or obelisk, 20 feet high, near the centre; the other, a similar double circle of 45 stones, to the north-west of the former, with a dolmen in the centre. The stones that remain of this ancient work are not of uniform size; they measure from 5 to 20 feet in height above the ground, and from 3 to 12 in breadth and thickness. The embankment, which is broken down in several places, had originally an entrance to the circle, from which issued the 'Kennet Avenue,' running 1430 yards south-eastward in a perfectly straight line, and 17 yards broad, with a range of blocks on either side similar to those of the circle itself. Of the surrounding antiquities, those which appear most closely connected with the circle are the double circle (155 × 138 feet) on Hakpen Hill, and a large barrow, or lofty conical mound called Silbury Hill, three-quarters of a mile to the south. It is situated nearly midway between the two

avenues, in the line of the ancient Roman road between London and Bath. Close to the base, it measures 676 yards in circumference; the sloping height is 249 feet; the perpendicular height, 130 feet; the diameter of the level area at the top, 104 feet; the space covered by the whole work, over 5 acres. Avebury was included in the Ancient Monuments Protection Act, 1882.

Very little was known of Avebury temple and the antiquities in its vicinity till the year 1740, when Dr Stukeley published his *Stonehenge and Abury, Two Temples restored to the British Druids*; though Aubrey had written an account of them in 1663, by command of Charles II., the manuscript of which still exists. None of the earlier topographers or antiquaries appear to have left any description of them. When Sir Richard Hoare, in collecting materials for his *Ancient Wiltshire*, examined them in 1812, 72 years after the appearance of Stukeley's work, and 164 after the first survey by Aubrey, a great number of the stones had disappeared, and in many places it was difficult to trace out even the plan of the works. As to more recent inquirers, Mr Fergusson believes that the Avebury circle and Silbury Hill mark the graves of those who fell in the twelfth or last Arthurian battle, at Badon Hill (520 A.D.), whilst Sir John Lubbock assigns Avebury to the close of the stone, or the commencement of the bronze, age. See works cited under **STONEHENGE**.

Aveiro, a town of Portugal, in the province of Beira, 40 miles S. of Oporto by rail. It is situated on the Ria d'Aveiro, a salt lake or lagoon, joined to the sea by a canal. Aveiro is a bishop's see, manufactures sea-salt, and has valuable fisheries of sardines and oysters. Pop. 7167.

Avellino (anc. *Abellinum*), chief town of an Italian province of the same name, at the foot of Monte Vergine, 59 miles E. of Naples by rail. Avellino suffered greatly from earthquakes in 1694, 1731, and 1805. It has a cathedral and royal college, manufactures of linen, paper, hats, salami, and considerable trade in corn and in hazel-nuts, which were famous even in antiquity. Pop. (1881) 16,376; of province (1881) 393,228.

Ave Maria, also **ANGELICA SALUTATIO** or the Angelic Salutation, are names given by the Roman Catholics to a very common form of address to the Virgin Mary. *Ave Maria* are the first two words of the prayer, in Latin, which is taken from the angel Gabriel's salutation (Luke i. 28): 'Hail, Mary, highly favoured, the Lord is with thee; blessed art thou among women.' In this form, according to an ordinance of Gregory I., with the addition of Elizabeth's words, 'and blessed is the fruit of thy womb,' the invocation was at first said by the priests during mass, on the fourth Sunday after Advent. With the extended cult of the Virgin since the 11th century, the Ave Maria appears as a lay-prayer of equal use with the Pater Noster, and was sanctioned as such at the end of the 12th century. Accordingly, not only did Urban IV. (1261) add the concluding words, *Jesus Christus, Amen*, but since the first half of the 16th century, the prayer began to receive, more and more commonly, as an addition to the old formula, what constitutes the conclusion of the modern form: 'Holy Mary, mother of God, pray for us sinners, now and at the hour of our death, Amen.' The complete form in Latin is: 'Ave Maria, gratia plena, benedicta tu in mulieribus, Dominus tecum; et benedictus fructus ventris tui, Jesus. Sancta Maria, Mater Dei, ora pro nobis peccatoribus nunc et in hora mortis nostrae, Amen.' An edict of John XXII. (1326) ordains that every Catholic shall, morning, noon, and evening, at the warning of the bells, repeat three

aves. This ringing of bells as a summons to morning, mid-day, and evening prayer, is retained in some countries, and is still called the Ave Maria, or Angelus Domini. The whole prayer as it now stands is ordered in the breviary of Pius V. (1568) to be said daily before the Canonical Hours (q.v.), as well as after Compline. The aves are reckoned by the small beads of the rosary, which are hence called Ave Marias, while the large beads are devoted to the Pater Noster. The name *Angelus Domini* comes from the Latin version of the passage in Scripture introducing the salutation. There are famous musical settings of the Ave Maria by many of the great composers.

Avempace (*Ibn Badja*), Arabian philosopher, was born in Spain towards the close of the 11th century, most likely at Saragossa, lived as a physician in Morocco at the court of the Almora-vides, and died at Fez in 1138. His principal work, known to us only through a Jewish writer of the 14th century, was the *Conduct of the Solitary*, a system of rules whereby mankind might rise to higher things.

Avens, the popular name of Geum (q.v.), a genus of Rosaceae, of which two species, *G. urbanum*, the Common Avens, and *G. rivale*, or Water Avens, with their hybrids, are common in Britain, and range through temperate regions. The roots were formerly used in pharmacy as a tonic, astringent, and aromatic, whence the names of clove-root and herb-bennet (*herba benedicta*) of old herbals.

Aventine Hill. See **ROME**.

Aventinus [**JOHANNES THURMAYR**], a scholar and historian, born at Abensberg (Lat. *Aventinum*), Bavaria, in 1477, studied at Ingolstadt, Vienna, and Paris, and afterwards taught Greek and mathematics at Cracow. In 1509 the Duke of Bavaria called him to Munich, and intrusted him with the education of his sons. Here Aventinus wrote his history of Bavaria (*Annales Boiorum*). This work was not published until twenty years after his death, which took place at Ratisbon in 1534, and then only with large portions, more true than pleasant, about the Romish Church, excised. These, however, were all restored in Cisner's edition of 1590. Aventinus wrote several other learned works on history and antiquities. A complete edition of his works was issued by the Bavarian Academy of Sciences (Munich, 5 vols. 1880-84). His monument was erected in his native town in 1861. See Döllinger's *Aventinus und seine Zeit* (Munich, 1877).

Aventurine, or **AVANTURINE**, a vitreous variety of quartz, generally translucent, and of a gray, green, yellow, red, or brown colour, and containing numerous minute spangles. These last are generally mica, but sometimes, according to some authorities, they are scales of metallic copper. It is used in jewelry, but is not so much valued as the finer kinds of amethyst or cairngorm stone. It is found in Silesia, Bohemia, France, Spain, and India, but chiefly in the Ural Mountains, near Ekaterinburg. Beautiful imitations of aventurine are made. The name for the natural substance in fact is borrowed from that applied to the artificial gold-spangled glass which originated accidentally—*all' avventura* (*par aventure*)—at Murano, near Venice.

Avenzoar (properly *Ibn Zohr*), **ABU MERWAN**, an Arabian physician, born in Spain about 1072, died in 1162. He was the teacher of Averrhoes (q.v.), who speaks highly of his wisdom. One of his works was translated into Hebrew in 1280, and from thence into Latin, and was published, under the title *Rectificatio Medicationis et Regiminis*, at Venice, in 1490. It has since passed through numerous editions (as at Lyons, 1851).

Average. If any number of unequal quantities are given, another quantity may be found of a mean or intermediate magnitude, some of the given quantities being greater, and others less, than the one found, which is called the average. The exact relation is this: that the sum of the excesses of the greater above the average is equal to the sum of the defects of the less below it. If there are seven vessels unequally filled with sand, and containing, say, 5, 10, 12, 8, 11, 14, 3 ounces, the average is found by adding the numbers together, and dividing the sum 63 by 7, which gives 9 ounces as the average. Reflection, however, requires to be exercised in striking averages. If a farmer has three lots of cattle, the first of which he averages at £25 a head, the second at £15, and the third at £9, it might be thought that the average of the whole stock made up of the three lots would be got by taking the mean of £25, £15, and £9—viz. $25 + 15 + 9 \div 3 = £16\frac{1}{3}$. But this would be correct only if there were an equal number of cattle in each of the lots. To get the real average in case of the lots being unequal, he must multiply the average of each lot by the number of cattle in it, add the three products together, and divide by the whole number of cattle in all three lots taken together. If we suppose 9 head in the first lot, 20 in the second, and 15 in the third, the average is $(25 \times 9) + (15 \times 20) + (9 \times 15) = 660 \div (9 + 20 + 15) = £15$.

General Average is a contribution made by the various interests associated in a maritime adventure to restore the value of any sacrifice or extraordinary expense voluntarily incurred for the general safety. This equitable rule is to be found in the Rhodian law (q.v.) and in the Rolls of Oleron (q.v.), and has been adopted with certain modifications and differences by all maritime nations. The requisites to this contribution are that the sacrifice of part of the cargo, ship, or rigging has been advisedly made to procure the safety of what remains. The loss must not be caused by fault of the master or improper stowage; thus the throwing overboard or Jettison (q.v.) of deck cargo will not give rise to average unless the stowing on deck is customary or agreed to by the contributing parties. The value of the cargo thrown overboard is computed at the market price at the port of delivery, less freight and charges saved. Among other losses covered by general average are those arising from the discharge of cargo to lighten the ship, from damage to ship or cargo in order to extinguish fire, or from cutting away masts or slipping anchors and cables to save the ship. The expenses incurred in floating a stranded ship or entering a port of refuge are also included, but no loss or expense falling under the shipowner's contract to keep his ship fit for service will be so included.

The contributing parties are the owners of the ship, the cargo, and the freight, or in modern times the insurers of these, and they are assessed in proportion to their value. The owners of the cargo pay on the net market value at the port of destination, or where the voyage is broken up, and the goods jettisoned contribute as well as those saved, as otherwise the owner of the lost goods would be placed in a better position than the others. Seamen's wages, and the personal effects of crew and passengers, are exempt from contribution.

If the ship reaches her destination, the average must be adjusted at that port, and in accordance with the law of the place; but if the voyage is broken up, the port of loading is taken. The adjustment of averages is often a very complicated task, and is usually undertaken by persons specially engaged in that business, called average adjusters.

Much inconvenience has arisen from the want of a uniform system of general average in different

countries, and an effort to establish such a system was made by an international congress, the first meeting of which took place in Glasgow in 1860 under the presidency of Lord Brougham. At a subsequent meeting at York in 1864, a code of rules was drawn up, but no practical result followed. Another important conference, however, was held at Antwerp in 1877, when the York rules were revised; and the new code, known as the York-Antwerp rules, are gradually becoming generally recognised by means of a clause inserted in bills of lading and insurance policies.

Particular Average is the partial loss of ship or cargo, or damage thereto from accidental causes. In this case the common safety is not in question, and there is consequently no contribution, the loss remaining where it falls. To such cases the term average does not seem properly to apply, but the name has become applicable to all claims for loss at sea when not total, and its use in this case may possibly be explained by the consideration that such losses under marine policies are usually made good by contribution from various underwriters or joint-insurers.

An **Average Bond** is sometimes entered into by the contributors in order to fix an arbiter to adjust the average.

The best treatises on the subject of average are Hopkins' *Handbook of Average*, and Lowndes' *Law of General Average*. See INSURANCE, ADJUSTMENT OF AVERAGE.

The etymology of the word has caused much discussion. It first appears about the year 1500 in connection with the maritime trade in the Mediterranean, hence the corresponding Fr. *avarie*, Span. *averia*, Port. and It. *avaría*, as well as in the borrowed Ger. *haferei*, and Dutch *avarij*. The Italian form is most probably the original, from *avere*, 'goods'; Lat. *habere*, 'to have.' The It. *avere* is thus our old Eng. *aver*, 'property,' often specially in cattle, therefore 'cattle,' 'horses.' The reader of Burns will remember the word *avir*, 'an old horse.'

Avernus (Gr. *Aornos*, 'birdless'), called now Lago d'Averno, is a small, nearly circular lake in Campania, Italy, situated between Cumæ, Puteoli, and Baïæ. It is about a mile and a half in circumference, and occupies the crater of an extinct volcano. It is in some places as deep as 200 feet, and is almost completely shut in by steep and wooded heights. The sulphureous and mephitic vapours arising from the lake were believed in ancient times to kill the birds that flew over it; hence, according to some, its Greek appellation. Owing to its gloomy and awful aspect, it became the centre of almost all the fables of the ancients respecting the world of shades. Here was located Homer's entrance to the under world; here the Cimmerians are said to have dwelt in deep caverns, without ever coming into the light of day; here also were placed the Elysian fields, the grove of Hecate, and the grotto of the Cumæan Sibyl. Agrippa caused the dense woods to be thinned, by which the place lost much of its wildness; and by a cutting connected it with the Lucrine Lake and the sea, so as to make it a kind of harbour, but the volcanic upheaval of the Monte Nuovo in 1538 altered the region, and made Avernus again an inland lake. On its east side are ruins of a temple of Apollo, on its south side what is shown as the famous grotto of the Sibyl.

Averrho'a. See CARAMBOLA.

Averrho'es, or AVERROES (properly *Ibn Roshd*), the most famous of the Arabian philosophers, was born at Cordova, in Spain, in 1126. His father, who was judge there, instructed him in Mohammedan jurisprudence. In theology and philosophy, he had Ibn Tophail for his teacher;

and in medicine, Ibn Zohr, the elder. His talents and acquirements made him be appointed successor to his father, and afterwards judge in Morocco. For a while he was the calif's physician. Being accused of a departure from the orthodox doctrines of Mohammedanism, he was dismissed from his office, and condemned to recant his heretical opinions, and do penance. After this, he returned to his native place, and lived in great poverty, until the Calif Al-mansur reinstated him in his offices, on which he went back to Morocco, where he died in 1198. Averrhoes regarded Aristotle as the greatest of all philosophers. He translated (from the Syriac) and illustrated Aristotle's writings with great penetration; but the influence of the Alexandrian or Neoplatonic views is seen in his works, as in those of most of the Arabian philosophers. Thus he teaches the doctrine of a Universal Reason (other than the individual reasons), indivisible, but shared in by all; and denied the immortality of individual men. He expounded the Koran according to Aristotle, and so founded a Moslem philosophy of religion, the cause of many heresies. In opposition to the Arabian orthodox school, especially against Algazali, Averrhoes stood forth on the side of reason as the defender of philosophy. The Arabians called him, by way of eminence, the Expositor (of Aristotle). Most of his writings are known to us only through Latin translations (Ven. 1489). The Arabic text of the philosophical works was published in 1859 by M. J. Müller, followed by a German translation in 1875. Averrhoes also wrote a sort of medical system, which, under the name of *Colliget*, was translated into Latin, and repeatedly printed. The philosophy of Averrhoes attained to importance in the Christian Church as early as the 13th century, although his pantheistic doctrine of the unity of the active principle in the universe was often repudiated as an error, and astrology was characterised as Averrhoism. See Renan's *Averroës et l'Averroïsme* (2d ed. 1860).

Aversa, a town of Southern Italy, in the province of Caserta, 12½ miles by rail N. of Naples, in a beautiful district rich in oranges and wine. It is well built, and has a cathedral and a number of monasteries, in one of which Andrew of Hungary, the Darnley of Neapolitan history, was murdered with the connivance of his wife, the beautiful but guilty Joanna, queen of Naples; it has also an excellent asylum for the insane, established by Murat, and a founding hospital. Aversa was built in 1029 by the Normans. About two miles from Aversa are a few ruins of Atella, famous as the birthplace of the satirical farces so popular on the Roman stage (see *ATELLANÆ*). Pop. (1881) 20,183.

Aves. See BIRDS.

Avesnes, a town in the French department of Nord, 13 miles E. by rail of Cambrai, with a pop. (1881) of 5468, who make cloth, soap, and beer.

Avesta. See ZEND-AVESTA.

Aveyron, a department in the south of France, named from the river which runs westwards through it, and after a course of 90 miles falls into the Tarn, a feeder of the Garonne. The department of Aveyron has an area of 3376 sq. m., in one of the most mountainous parts of France. Situated between the highlands of Auvergne and the Cevennes, it slopes like a terrace south-west to the Garonne. A third part of the land is unfit for cultivation, but affords excellent pasture for the numerous herds of cattle, goats, sheep, and swine, which form the principal resources of the mountaineers. The famous Roquefort cheese is exported hence in large quantities. Coal, iron, lead, zinc, copper, silver, alum, and antimony are found and

wrought; and paper, cotton and woollen cloths, and leather are produced. The capital is Rodez. There are many prehistoric remains in the department, which was formerly part of the province of Guienne. Pop. (1886) 415,826.

Avezzano, a town of South Italy, in the province of Aquila, 22 miles S. from Aquila, with old walls and a collection of antiquities. Pop. (1881) 6166.

Avianus, FLAVIUS, a Latin author who lived probably in the 3d or 4th century of our era, and of whose writings forty-two *Æsopic* fables in poor elegiac verse are extant. The editions are those by Lachmann (1845) and Robinson Ellis (1887).

Aviary, a place for keeping birds. Amongst the Romans, the name *aviarium* was sometimes used of a place for keeping and fattening birds meant to be killed for food. The arrangements of an aviary depend upon the habits of its inmates, the climate suited to them, and other circumstances. A large room may be fitted up as an aviary, with complete arrangements for heating and ventilation, and with perches resembling trees and branches, patches of sand or gravel, secluded places for nesting, and a trough of clear water; or in the open air a large space may be included within the network, with actual trees and grass, and running water. In such spacious aviaries birds may be expected to thrive and breed better than in a bird-cage, which is a small aviary. Large aviaries are often to be seen in zoological gardens.

Avicbron, long deemed, like Avempace, an Arabian philosopher, till Munk identified him in 1857 with Salomo ben Jehuda ibn Gabirol, a Jewish poet and philosopher. Born about 1020 at Cordova or Malaga, the latter in 1045 was expelled from Saragossa, and, after an unhappy, wandering life, died about 1070 at Valencia. His great work, *Mekor Chajim*, was written in Arabic; but through a Latin translation, *Fons Vitæ*, became known to the Schoolmen of the 13th century. Its speculations are largely based on those of the Neoplatonists, especially Plotinus. For a full account of it, and of Avicbron's religious poetry, artistic at once and profound, see two monographs by Geiger (Leip. 1867) and Stössel (*ib.* 1881).

Avicenna (Arabic *Ibn Sina*), a famous Arabian philosopher and physician, was born 980, near Bokhara, his father being a Persian tax-collector. He studied with singular zeal and success the Koran, mathematics, astronomy, the philosophy of Aristotle, and medicine. He was physician to several of the Samanide and Dilemite sultans, and also for some time vizier in Hamadan, where, after some years of retirement at Ispahan, he died in 1037. His works are based on those of the Greeks, whom he knew only through Arabic translations. His medical system, the *Canon*, long remained the standard of teaching and practice. His philosophy was Aristotelianism modified by Neoplatonic elements. Of his numerous writings, the chief, both medical and philosophical, were translated into Latin as early as 1493, and often reprinted.

Avicennia, or WHITE MANGROVE, a genus of Verbenaceæ (q.v.), consists of trees or large shrubs resembling mangroves (see MANGROVE), and like them, growing in tidal estuaries and salt-marshes. Their creeping roots, often standing six feet above the mud in crowded pyramidal masses, and the naked asparagus-like suckers which they throw up, have a singular appearance. The bark of *A. tomentosa*, the White Mangrove of Brazil, is much used for tanning. A green resinous substance exuding from *A. resiniferu* is eaten by the New Zealanders.—The genus is named in memory of the Arabian physician Avicenna.

Avicula. See PEARL OYSTER.

Avienus, RUFUS FESTUS, a Latin descriptive poet of some merit, who flourished about the end of the 4th century. His works are *Descriptio Orbis Terræ*, in 1394 hexameters; *Ora Maritima*, in 703 iambic trimeters, describing the Mediterranean shore from Marseilles to Cadiz; *Aratea Phænomena*, in 1325, and *Aratea Prognostica*, in 552 hexameters, a paraphrase of the two well-known works of Aratus. See Holder's edition (Innsbruck, 1887).

Avi-fauna (Lat. *avis*, 'bird,' and *fauna*), a collective term for the birds found in any country: the fauna or zoology of that region as regards the birds. See FAUNA.

Avigliano, a town of South Italy, in the province of Potenza, situated on a hill-ridge, 10 miles NW. of Potenza. Its inhabitants rear cattle, and are noted for their peculiar costume. Pop. (1881) 12,949.

Avignon (*Avenio*), a city of Provence, capital of the French department of Vaucluse, is situated on the left bank of the Rhône, 75 miles NW. of Marseilles. With narrow, crooked streets, 'windy Avignon' still is encircled by lofty crenellated walls (1349-68), except on the north side, where the Rocher des Doms rises steeply from the Rhône to a height of 200 feet. Here is the cathedral of Notre Dame, dating from the 11th century, with its papal throne, and monuments of two popes; whilst hard by towers the vast palace of the popes (1339-64). The multitude of churches and convents made Rabelais call Avignon *la ville sonnante*, 'the city of bells'; and churches there still are in plenty, though that of the Cordeliers, with the tomb of Petrarch's Laura, was demolished in 1791. Near the hôtel-de-ville (1862) are the quaint old Jacquemart belfry and a statue of Crillon, Henry IV.'s brave captain; Petrarch's statue (1874) may also be noticed. The city is the seat of an archbishop, has a museum and picture-gallery, and several other valuable institutions. The university, founded in 1303, was abolished in 1794. Avignon has manufactures of paper, leather, silk, iron, &c., and is famous for its garden produce, its fruit, wine, honey, &c. The country about Avignon is delightful, and extremely fruitful in corn, wine, olives, oranges, and lemons. Pop. (1872) 38,196; (1886) 41,007. In Avignon, Petrarch spent several years; here, in the church of St Clara, he first saw Laura. Vaucluse, which he has immortalised, lies 18 miles from Avignon. Avignon was the capital of the ancient *Cavares*, and presents many remains of the times of the Romans. In the middle ages, it formed, with the surrounding district, a county, which the popes, who had already received the county of Venaissin as a gift from King Philip III., bought in 1348 from Joanna, queen of Naples and Countess of Provence. The pope governed both counties through a vice-legat, and continued in the possession of them till 1790, when, after several stormy and bloody scenes, the city with its district was united with France. At the peace of Tolentino (1797), the pope formally resigned Avignon and Venaissin. Avignon is celebrated in ecclesiastical history as being for a time the residence of the popes. By order of Philip IV. of France, Pope Clement V. and six of his successors from 1309 to 1377, were obliged to reside there. It was afterwards (1378-1418) the residence of the French anti-popes. Two ecclesiastical councils were also held at Avignon (1326-37). A little cottage here was long the loved retreat of John Stuart Mill, the place where he died in 1873. Here, too, is a monument (1882) to the mechanician, De Girard.

Avila, a town of Spain, capital of the province of Avila, in Old Castile, situated at a height

of 3000 feet above the sea, at the base of the Sierra de Guadarrama, 71 miles NW. of Madrid by rail. Avila has a fine Gothic cathedral, and a Moorish castle, and its massive granite walls still stand, 42 feet high and 14 broad, with 86 towers and 10 gateways. Its university, founded in 1482, was reduced to a college in 1807. Pop. now only about 9000, engaged in manufacturing cloth. Here St Teresa was born. The province is mountainous, but has fertile valleys. Its mineral wealth is still undeveloped; the chief produce is merino wool. Area, 2981 sq. m.; pop. estimated (1884) at 186,400.

Avila, GIL GONZALEZ D', born at Avila in 1577, died in 1658, was a royal historiographer for Castile, and wrote histories of several Castilian kings.

Avila y Zuniga, DON LUIZ DE, a Spanish general, diplomatist, and historian, born about 1490, enjoyed the favour and confidence of Charles V., who intrusted him with embassies to the popes Paul IV. and Pius IV. He accompanied the emperor on his expedition against the German Protestant princes, and wrote an account of the war. The *Comentarios*, first published in 1547, were translated into several languages.

Aviles (anc. *Flavignavia*), a seaport of Spain, close to the Bay of Biscay, 19 miles N. of Oviedo. There are coal and copper mines in the vicinity. Manufactures of earthenware, glass, linen, &c. are also carried on. Pop. (1878) 8979.

Avi'so (Span. *aviso*, 'advice,' 'intelligence'), a despatch-boat, a small swift vessel belonging to the navy; also used of a kind of torpedo-boat.

Avison, CHARLES, a musical composer, was born at Newcastle about 1710, and after studying in Italy, became organist at Newcastle, where he died in 1770. He wrote an *Essay on Musical Expression* (1752), in which he ranked the French and Italian composers above the Germans; and he composed sets of concertos and sonatas which were very popular for a time. He figures in Browning's *Parleyings with Certain People*.

Avizandum (late Lat. *avizare*, 'to consider,' 'to advise') formerly meant the report of a cause made by a Lord Ordinary to the Inner House of the Court of Session, when all causes were decided by the Inner House, and merely sent to the Ordinary for procedure. This practice survives only in the case of five different kinds of action. The word is also applied to the consideration which the Lord Ordinary now gives to a cause before pronouncing judgment. It is also used when a sheriff or other judge takes a case for private consideration outside the Court, and delays judgment.

Avlona (Ital. *Valona*, anc. *Aulon*), the best seaport in Albania, in the province of Janina, stands on an eminence near the Gulf of Avlona, an inlet of the Adriatic, protected by the island of Sasseno, the ancient Saso. It is one of the stations of the Austrian Lloyd steamers, and carries on considerable trade with Brindisi, &c. Pop. about 5000. The Christian inhabitants, who are chiefly Italians, are engaged in commerce, exporting oil, wool, salt, pitch, and especially some 40,000 tortoise-shells yearly. The Turks are employed in the manufacture of weapons and woollen fabrics. *Valonia*, a material imported to England for tanning, is the pericarp of an acorn grown in the neighbourhood. Up to 1691 the town belonged to the Venetians.

Avo'ca, or OVOCA (Celt. 'meeting of the waters'), a small river in the SE. of County Wicklow, formed by the union of the Avonmore and Avonbeg, which rise in the hills of the centre of the county. The Avoca runs through a very picturesque vale only a quarter of a mile broad, with wooded banks 300 to 500 feet high, and after

a course of 9 miles reaches the sea at Arklow. A railway now extends through the vale, and connects a mining district with Wicklow and Dublin. The 'sweet vale' is celebrated in one of Moore's *Irish Melodies*. At Avondale, on the Avonmore, was born Mr C. S. Parnell.

Avoca'do Pear, or ALLIGATOR PEAR (*Persea gratissima*), a fruit-tree of the natural order Lauraceæ (q.v.), is a native of tropical America and the West Indies. The fruit is a drupe, but in size and shape resembles a huge pear; is usually of a brown colour, and has a soft or deep green pulp, not very sweet, but of a delicate flavour, which dissolves like butter on the tongue, and contains a large quantity of a fixed oil which is sometimes expressed for soapmaking and illuminating purposes. It is called *vegetable butter* in some of the French colonies. It is much esteemed in the West Indies, and often eaten with pepper and salt, or with sugar and lime-juice or spices. The seeds give a black stain, used for marking linen.

Avocet (*Recurvirostra*), a genus of birds, which, although having the feet webbed nearly to the end of the toes, is usually ranked among the Grallæ or Grallatores, on account of the length of the legs, the half-naked thighs, the long, slender, elastic bill, and the general snipe-like habit. They are distinguished from all other birds, except a few species of humming-bird, by the strong upward curvature of the long slender bill, which is much like a thin piece of elastic

The Common Avocet (*Recurvirostra avocetta*).

whalebone, and adapted as a tactile organ for seeking food in the mud, as their webbed feet are for walking upon it, and their long legs for wading in the fens and marshes which they frequent. The wings are long and pointed; the tail short and rounded. They can move quickly along the ground, and fly swiftly and low. Swimming is only resorted to by accident or compulsion. They scoop through the mud with the bill, first to one side, and then to the other, in quest of worms and other small animals; although Audubon also observed the American Avocet taking insects which were swimming on the surface of the water, and expertly catching them in the air, running after them with partially expanded wings. The avocets are found in most parts of the globe.—The Common Avocet (*R. avocetta*), about the size of a lapwing, is sometimes, though very rarely, found in the fenny districts of England; it is a native of the continents of Europe, Asia, and Africa, occurring even at the Cape of Good Hope.—Other species are natives of North America, India, and New Holland.—The American Avocet (*R. americana*) has the bill less recurved than the Common Avocet.

Avoga'dro, AMADEO, was born in 1776, and died, professor of Physics at Turin, in 1856. He formulated his law as to the Atomic Theory (q.v.) in 1811.

Avoidance, in ecclesiastical law, signifies the vacancy of a benefice, or the fact of its being void of an incumbent. See BENEFICE.

Avoirdupois, or AVERDEPOIS, is the name given to the system of weights and measures applied in Great Britain and Ireland to all goods except the precious metals and precious stones and medicines. The word is derived from the old French *avoir de pois* ('goods of weight'), the *du* for *de* being a corruption; the word *avoir* or *avoir* being a noun meaning 'property', 'goods'. The correct spelling is the form *averdepois*, in use in the 17th century.

The grain is the foundation of the avoirdupois system, as well as of the troy. A cubic inch of water, at standard temperature, weighs 252·458 grains. Of the grains so determined, 7000 make a pound avoirdupois, and 5760 a pound troy (see WEIGHTS AND MEASURES).—The avoirdupois pound is divided into 16 ounces, and the ounce into 16 drams. A dram, therefore, contains 27½ grains, and an ounce 437½ grains.

TABLE OF AVOIRDUPOIS WEIGHT.

27½ grains	are 1 dram1 dr.
16 drams or drachms	" 1 ounce1 oz.
16 ounces	" 1 pound1 lb.
28 pounds	" 1 quarter1 qr.
4 quarters	" 1 hundredweight1 cwt.
20 hundredweight	" 1 ton1 ton.

A cubic foot of water weighs 997·14 ounces avoirdupois, or nearly 1000 ounces, which gives an easy rule for determining the weight of a cubic foot of any substance from its specific gravity. Avoirdupois is the weight used in the United States of North America, where, however, a cwt., or *cental*, of only 100 lb. has come into general use, and a ton of 2000 lb.

Avola (*Abolla*), a seaport town on the east coast of Sicily, 13 miles SW. of Syracuse. It was destroyed by earthquake in 1693, but afterwards rebuilt. The famous honey of Hybla comes from this neighbourhood. There is tunny-fishing, a sugar-refinery, and some trade in agricultural produce. Pop. (1881) 12,286.

Avon, a word of Celtic origin, meaning 'river' or 'stream,' which seems allied to Aa (q.v.), and which is the name of several of the smaller British rivers. Of these may be noticed—(1) The Upper or Warwickshire Avon, which rises at Naseby in Northamptonshire, runs south-west through Warwickshire and Worcestershire, passing Rugby, Warwick, Stratford, and Evesham, and joining the Severn at Tewkesbury. It has a course of 96 miles, and receives several tributaries, including the Swift from Lutterworth. Its pretty peaceful course, whose waves rolled Wyclif's ashes towards the sea, and saw the first flights of the 'sweet Swan of Avon,' is finely depicted in twenty-one etchings by Mr Heywood Sumner (Lond. 1881).—(2) The Lower, or Bristol Avon, which rises in North-west Wiltshire, and runs about 70 miles, first south in Wiltshire, and then west and north-west between Gloucestershire and Somersetshire. It traverses an oolitic basin, passing Bradford, Bath, and Bristol, and empties itself into the Bristol Channel. It is navigable for large vessels up to Bristol. It runs generally between deep banks in a rich valley. A canal through the middle of Wiltshire connects it with the Thames.—(3) The Wiltshire and Hampshire, or East Avon, which rises in the middle of Wiltshire, and runs south 70 miles through Wiltshire and Hampshire, passing Amesbury, Salisbury, and Ringwood, and

entering the English Channel at Christchurch. It is navigable up to Salisbury. It abounds in the small delicate loach. In Wales, two rivers named Avon—one rising in Monmouthshire, the other in Glamorganshire—fall into Swansea Bay. In Scotland there are several of the same name, affluents of the Spey, Clyde, and Forth.

Avonmouth, in Gloucestershire, at the mouth of the Avon, 6 miles NW. of Bristol, with which it is connected by the Bristol Port and Pier Railway. Here are a pier and extensive docks (1879), constructed for the railway company at a cost of £600,000.

Avranches (anc. *Abrincatæ*), a French town in the department of Manche, situated on the slope of a hill on the left bank of the Sée, near its mouth in St Michel's Bay, 37 miles E. of St Malo by rail. Till 1801 a bishop's seat, its former cathedral was built in the 18th century on the site of a cathedral consecrated in 1121, in which Henry II. received absolution for Becket's murder. Avranches has manufactures of lace, candles, and salt, and some trade in cider, grain, butter, cattle, &c. Pop. (1881) 7889.

Awe, LOCH, an Argyllshire lake, with Loch Awe station and hotel near its foot, 22 miles E. of Oban. Lying 118 feet above sea-level, it extends 22½ miles north-eastward, varies in breadth between 3 furlongs and 3½ miles, covers 15½ sq. m., and has a maximum depth of 102 feet. The country around consists of mica-slate. The scenery is most striking at the north-east end—originally the head—of the lake, where the water is studded with numerous wooded islets, overshadowed by towering and rugged mountains, prominent among which rises the dark and rocky ridge of Ben Cruachan, 3689 feet high, and 14 miles in circuit. Of the islets, the most noted are Fraoch-Eilean, containing the remains of a castle granted to Gilbert Macnaughton in 1267 by Alexander III.; and Inishail, with its ancient burying-ground, where in 1857 Mr Hamerton fixed his 'painter's camp.' On a rocky peninsula, in the north end of the lake, stands Kilchurn Castle, once a fortress of great strength, built about 1440 by Sir Colin Campbell of Glenorchy. The waters of the lake are carried off at its north-west end by the brawling river Awe, which, after a course of 5 miles, enters Loch Etive at Bunawe. The magnificent 'Pass of Brander,' through which the road and railway run beneath the shoulder of Ben Cruachan, was the scene of a conflict in 1308 between Robert the Bruce and the Macdougals of Lorn, in which that clan was all but exterminated. At the north-east end of the loch it receives the waters of the Orchy and Stræ. Loch Awe contains fine fish, especially trout, *Salmo ferox*, and salmon; and the small villages of Cladich and Port Sonachan are the general resort of anglers. A steamer plies on the loch. From Loch Awe the Campbells took their 'slogan' or war-cry, 'It's a far cry to Lochow.'

AWN (*Arista*), in the flowers of Grasses (q.v.), a solitary pointed bristle, growing either from a glume or a palea. The flowers of some grasses are entirely *awnless*; in many, the glumes alone are *awned*, or only one of them; in others, the glumes are *awnless*, and the palea, or one palea, *awned*. The awn often appears as a terminal prolongation of the midrib of glume or palea; or it may separate below the point, and is then said to be *dorsal*; or may be jointed at the base, and free from the joint onwards. It may be straight or bent like a knee, or even twisted, and liable to change when moist. Sometimes it is rough, or even serrate, at the edges, as in barley; and sometimes feathery, as in feather-grass (*Stipa*),

where it is also remarkable for its great length. The characters of genera and species are often derived from the awn, but it is not always invariable, even in the same species, and the cultivated varieties of wheat and oats differ much in being more or less *bearded*. There appears to be a tendency to the diminution or disappearance of the awn through cultivation. See GRASSES.

AX, a town in the French department of Ariège, lies at the foot of the Pyrenees, at the junction of three picturesque valleys, 74 miles SSE. of Toulouse. Pop. 1700. It is celebrated for its baths, and possesses the hottest sulphur-springs in the Pyrenees, to the number of 80, ranging in temperature from 77° to 172° F.

AXE, an instrument, usually of iron, edged with steel, for hewing timber and chopping wood. The haft or handle is of a length and size suitable for wielding with both hands, and is fitted into a head with an arching edge in the plane of the sweep of the tool—the axe differing in this last respect from the adze, which is found in use amongst some uncivilised peoples that do not use axes at all. Similar instruments of smaller size, for use with one hand, are called hatchets (Fr. *hachette*, diminutive of *hache*, 'an axe'). The usefulness of the implement made it one of the first tools suggested by the needs of man, and, accordingly, among the very earliest archaeological relics we find almost invariably some form of axe. The stone axes of our own country are the same as those still in use in many islands of the South Pacific, and the Tomahawk (q.v.) of America finds a close parallel in the 'francisca,' a hatchet for throwing, at one time the national weapon of the Franks. These, and the bronze axes of England and Mexico, with the rough iron instrument of northern nations, all witness the primitive use of this weapon. The prehistoric axe is distinguished from a 'celt' proper (see CELT), which was a chisel, by a more complex shape, and by being bored or otherwise fitted for a handle. Within historic times, the axe has recovered its early importance with the progress of colonisation, and its importance to settlers has led to the invention of the American axe, which effects speedier results with the smallest expenditure of strength. The head of this axe is

The American Axe.

about nine inches long, and the arched head is somewhat broader than the back, while its sides are also convex. The principal advantage of this formation is that, as only part of the edge strikes the wood, on this spot all the force of the blow is concentrated; moreover, the convexity of the sides prevents the blade being caught fast, and facilitates its withdrawal. The handle, which is generally made of hickory or some other elastic wood, is rendered stronger and more elastic by its shape, resembling a half-strung bow. The manufacture of the axe includes more processes than might be supposed. After being cut to the requisite length, and the eye for the handle punched through it, it is pressed into shape between concave dies. With borax as a flux, the edge-piece of steel is now attached to a groove previously prepared, and several processes must follow, including welding, sharpening, tempering, polishing, and varnishing

with a mixture of turpentine and asphaltum, to prevent rust, before the finished instrument is ready for the market. A large quantity of these implements are manufactured in the United States, one establishment in Connecticut turning out almost 1000 daily. See also **BATTLE-AXE**, **HALBERT**, **LOCHABER AXE**.

Axel, or **ABSALON**, from 1177 Archbishop of Lund, and also minister and general to Valdemar I. and Canute VI. of Denmark, was born in 1128, and died at Sorø in 1201. He distinguished himself as well by wisdom and uprightness in peace, as by valour and address in war. The Wendish pirates were driven from the coasts of Denmark, and he defeated the Pomeranian prince, Bogislav. In the wise legislation of Valdemar and of his son, he had a great part. He favoured and promoted learning and art, and to his encouragement we owe the history of Denmark by Saxo Grammaticus. By building a castle, he laid the foundation of the future great city of Copenhagen, then an insignificant village.

Axestone, a variety of the mineral Jade or Nephrite (q.v.). It is of a greenish, grayish, or grayish-white colour, is more or less translucent, hard, tough, and not easily broken. It occurs in Silesia, in Central Asia and China, and in New Zealand and other islands of the Southern Pacific. It derives its name from the use to which it is put by the natives of these islands for making their hatchets. They also make eardrops of it.

Axholme, **ISLE OF**, a low level tract of North-west Lincolnshire, cut off by the Trent from the rest of the county. Measuring 18 by 5 miles, it was anciently a forest, but afterwards became a marsh, which was drained into the Trent in 1625 and succeeding years by Cornelius Vermuyden, a Dutchman, at a cost of £56,000. The reclaimed land became very fertile under Dutch and French Protestant settlers, but, after much litigation, it was in 1691 divided, the original inhabitants receiving 10,532 acres, and the settlers only 2868. In the *Saturday Review* for August 1, 1885, is a long and interesting account of the Isle of Axholme—the Mowbrays, its ancient lords; the wizard-hermit of Lindholme; and Epworth, the home of the Wesleys.

Axil (*axilla*), in Botany, the angle between the upper side of a leaf and the stem or branch from which it grows. Buds usually grow out from the stem in the axils of leaves, and this position is naturally termed *axillary*.—(2) In anatomical terminology, the axilla is the Armpit (q.v.).

Axim, an important station and port on the Gold Coast, a little to the E. of the mouth of the Ancobrah River. Inland from Axim, in the basin of that river, and in the district between it and the Prah, gold-mining operations have recently been carried on to a large scale. See Burton and Cameron, *To the Gold Coast for Gold* (1882).

Axinomancy (Gr. *axinē*, 'an axe,' and *manteia*, 'divination'), a mode of divination much practised by the ancient Greeks, particularly with the view of discovering the perpetrators of great crimes. An axe was poised upon a stake, and was supposed to move so as to indicate the guilty person; or the names of suspected persons being pronounced, the motion of the axe at a particular name was accepted as a sign of guilt. Another method of axinomancy was by watching the movements of an agate placed upon a red-hot axe. This is only one of a multitude of analogous modes of divination practised in all ages and among all nations. See **DIVINATION**, and **DIVINING-ROD**.

Axiom, a Greek word meaning a 'decision' or 'assumption,' is commonly used to signify a general

proposition which the understanding recognises as true, as soon as the import of the words conveying it is apprehended. Such a proposition is therefore known directly, and does not need to be deduced from any other. Of this kind, for example, are all propositions whose predicate is a property essential to our notion of the subject. Every rational science requires such fundamental propositions, from which all the truths composing it are derived; the whole of geometry, for instance, rests on comparatively a very few axioms. Whether there is, for the whole of human knowledge, any single, absolutely first axiom, from which all else that is known may be deduced, is a question that has given rise to much disputation; but the fact that human knowledge may have various starting-points answers it in the negative. Mathematicians use the word axiom to denote those propositions which they must assume as known from some other source than deductive reasoning, and employ in proving all the other truths of the science. The rigour of method requires that no more be assumed than are absolutely necessary. Every self-evident proposition, therefore, is not an axiom in this sense, though, of course, it is desirable that every axiom be self-evident; thus, Euclid rests the whole of geometry on fifteen assumptions, but he proves propositions that are at least as self-evident as some that he takes for granted. That 'any two sides of a triangle are greater than the third,' is as self-evident as that 'all right angles are equal to one another,' and much more so than his assumption about parallels (see **PARALLELS**). Euclid's assumptions are divided into three 'postulates' or demands, and twelve 'common notions'; the term axiom is of later introduction. The distinction between axioms and postulates is usually stated in this way: an axiom is 'a theorem granted without demonstration'; a postulate is 'a problem granted without construction'—as, To draw a straight line between two given points.

Axis, a genus of deer, abundant on the banks of the Ganges, but found throughout India and in many islands of the Eastern Archipelago. It was known to the ancients by the name Axis. One of its Indian names is Chittra or Cheetal, and by British sportsmen in India it is often called the Spotted Hog-deer, though that name is also given to a rarer species. The axis has a great resemblance in size and colouring to the European fallow-deer; it is generally of a rich fawn colour, beautifully spotted with white, nearly black along the back, the under parts snow-white. The horns, however, differ very much from those of the fallow-deer, being slender, sharp-pointed, little branched, and not at all palmate. The female has no horns, and is lighter in colour than the male. The axis frequents thick jungles in the vicinity of water, and feeds during the night. Its spots facilitate concealment in the interrupted light of jungle life. It is commonly found in herds of 15 or 20, of which 3 or 4 are males. Its sense of smell is remarkably acute, and it is generally very shy and timid, so that sportsmen find it difficult to get within range. The males, however, sometimes exhibit great courage in defence of the young. It is gentle and very easily domesticated, has been frequently imported into Europe, and breeds freely, when kept in parks, in Britain and France.

Axis, in Geometry. The axis of a curved line is formed by a right line dividing the curve into two symmetrical parts, so that the part on one side exactly corresponds with that on the other; as in the parabola, the ellipse, and the hyperbola. The axis of any geometrical solid is the right line which passes through the centre of all the corresponding parallel sections of it: in this sense, we speak of

the axis of a cylinder, a globe, or a spheroid. By the axis of rotation, we understand the right line around which a body revolves.—In physical science, the axis of a *lens* is the right line passing through it in such a manner as to be perpendicular to both sides of it; and the axis of a telescope is a right line which passes through the centres of all the glasses in the tube. The axis of the *eye* is the right line passing through the centres of the pupil and the crystalline lens.

Axis, in Botany, a term applied to the central portion of the higher plants (higher cryptogams as well as phanerogams), which bears the appendages or lateral members arranged upon it. Those plants in which no distinction of axis and appendages can be made out are termed *Thallophytes*, and include algae, lichens, and fungi. The stem is called the *ascending axis*; the root, the *descending axis*. In the germinating seed, these are distinguished as plumule and radicle. The terminal part of an axis bearing the reproductive organs in flowering plants is called the *floral axis*. This is usually a very short portion, but may be elongated, broadened, hollowed, &c. The notion of a flowering plant as simply an axis with more or less modified appendages serving different purposes, as scale, leaf, petal, stamen, carpel, &c., is older than Linnæus, but was first clearly grasped by the embryologist Wolff, and even more systematically at a later date (1790) by the many-sided poet Goethe. In describing animal forms it is customary to define the disposition of the parts in reference to certain axes, lateral, dorso-ventral, radial, &c. (see MORPHOLOGY).—The term *axis* is specially applied in human anatomy to the second vertebra of the neck (see SPINAL COLUMN).

Axminster, a small old town of Devonshire, on the left bank of the Axe, 27 miles E. of Exeter by rail. The parish church, originally cruciform, retains a good Norman doorway. From 1755 till 1835 Axminster was famous for the manufacture of Turkey and Persian carpets (see CARPET). Dr Buckland was a native. Pop. (1881) 2500. See Pulman's *Book of the Axe* (1875).

Axolotl (the Aztec word), an amphibian form occurring abundantly in some Mexican lakes, and found widely distributed in the Western United States. It used to be ranked among the forms which permanently retain their gills (*Perenni-branchiata*), but more complete observation has shown that it develops into a gill-less adult form (*Amblystoma*) like a salamander. Both forms

A, Axolotl; B, Amblystoma.

were known for some time before Dumeril in 1865 observed the passage of the gilled axolotl into the gill-less *Amblystoma*. Maria Chanvin and others have confirmed the discovery. The dry

saline character of the shore of some of the lakes apparently prevents the gilled axolotls in these cases from leaving the water and becoming lung-breathing adults, while in other instances drying up has doubtless acted as a condition forcing them to the adult mode of respiration. Thus the axolotl of Lake Como on the summit of the Rocky Mountains is said to be always transformed into *Amblystoma*, while in other cases the larval form seems to persist if the external conditions be favourable for breathing by gills. The axolotl is plump and short-legged, from 8 to 10 inches in length, of a dark colour with spots, and with the common amphibian character of slightly changing its colour (see CHROMATOPHORES). It bears three feathery gills on each side of its neck. Though in one sense larval, it is nevertheless sexually mature. It is esteemed a delicacy in Mexico. See AMBLYSTOMA.

Axum, once capital of an Ethiopian kingdom, is now in the modern Abyssinian province of Tigré, and lies mainly in ruins. Pop. 2000. The former greatness of the city is testified by yet remaining structures cut in granite, of which the most notable are a church, broken columns, and a great obelisk. Some of the ruins bear inscriptions, from which it appears that the Axumite empire extended over Abyssinia, and even over Yemen and Saba in Arabia, and possessed the command of the Red Sea. This country was the farthest point southward that Greek civilisation reached. Under King Aizanes (4th century), Christianity was introduced into the country from Egypt by the two apostles Frumentius and Aedesius. The new doctrine soon spread over the whole country; Frumentius was made the first Bishop of Axum, and the Axumite form of the language became the ecclesiastical language of Abyssinia. The Axumite empire formed the outermost bulwark of Christianity; and, as such, in its interference in behalf of the Christians in Arabia, it became the natural antagonist of Mohammedanism. The contests in which it soon became involved with that power caused its fall.

Ayacucho, formerly Huamanga or Guamanga, a town in the Peruvian department of the same name, 220 miles ESE. of Lima. Founded by Pizarro in 1539, it is now a handsome and thriving town. Here, on the 9th December 1824, the combined forces of Peru and Colombia—the latter then comprising Ecuador, New Granada, and Venezuela—totally defeated the last Spanish army that ever set foot on the continent. Pop. 9387.—The department of Ayacucho has an area of 24,213 sq. m., and a population of 142,000. It consists of elevated plains and deep valleys; agriculture and bee-keeping are the chief industries.

Ayala, PEDRO LOPEZ DE (*El Viejo*), was born at Murcia in 1332, of one of the first Castilian families. A brave soldier and able statesman, he filled some of the leading offices under several kings of Castile, and died in 1407. But Ayala's truest title to fame is his *Cronicas de los Reyes de Castilla* (best ed. 1780), which contains the history of Castile from the middle to the end of the 14th century. His *Rimado de Palacio*, begun during his captivity in England (1367), is a didactic and satirical poem of some value.—ADELARDO LOPEZ DE AYALA (1829-79) was likewise a poet and statesman.

Ayamon'té, a fortified town of Andalusia, Spain, on the left bank of the Guadiana, and near its mouth. Fishing and silk-weaving are carried on. Pop. 4478.

Ayasaluk, a village on the site of the ancient Ephesus (q.v.).

Aye-aye (*Cheiromys madagascariensis*), a rare and aberrant member of the Lemur family (q.v.).

It inhabits the woods of Madagascar, and was first noted in 1780 by Sonnerat, who was said to have given it the name Aye-aye in reference to the astonished exclamation of some natives when they saw the first specimen of the curious creature

Aye-aye (from Owen).

caught by a European. But more probably the name is onomatopoeic, derived from the cry of the animal, *Hai-hay* (*Hi-hi*). It was for long a puzzle to zoologists; Buffon placed it beside squirrels, and Cuvier was also inclined to regard it as a rodent. It was carefully described by Owen in the *Transactions of the Zoological Society*, 1866, and since the publication of this beautiful and exhaustive memoir, there has been no doubt as to the position of the aye-aye as an aberrant lemur.

It is about the size of a cat, with thick, dark hair; long, bushy, flexible tail; large naked ears, quick to detect the faintest sound; big, well-protected eyes, suited for its exclusively nocturnal and arboreal

Head and Fore-feet of Aye-aye on larger scale.
(From Owen.)

labours; rodent-like front teeth, with which it gnaws the branches in search of boring insects; and above all, a peculiar, spidery, hairy hand, with an extremely slender, almost wire-like, third finger, which looks as if it were paralysed, but is used in detecting and picking out the favourite wood grubs. Other characters of the unique hand will be seen in the figure. Its zoological position may be stated as that of a divergent offshoot from a primitive and generalised lemur type with many rodent affinities. It sleeps all day, wrapped in its bushy tail, and often within a nest in a tree-cleft; it is

very active at night, creeping along the branches with plaintive grunts, holding firm by its hind-feet, and tapping and probing with its fingers every here and there when its quick ear detects the presence of grubs. It also feeds on fruits, bamboo-pith, sugar-cane juice, and the like, and uses its long fingers very dexterously for drinking purposes. The natives of Madagascar regard this curious animal with superstitious reverence; and its peculiar structure and habits make it one of the most interesting of mammals.

Ayeshah (also *Aysha* or *Aisha*), the favourite wife of Mohammed, and daughter of Abu-Bekr, was born at Medina about 610 A.D.; and was only nine years of age when the Prophet married her. She was the only one of Mohammed's wives who accompanied him in his campaigns. Although Ayeshah bore no children to Mohammed, she was tenderly beloved by him. She was accused of adultery, but Mohammed produced a revelation from heaven (now in the Koran) to the effect that she was innocent. Mohammed expired in her arms (632). She now successfully exercised her influence to prevent Ali, the Prophet's son-in-law, from becoming calif, and secured the succession for her father, Abu-Bekr. Again on Othman's death she headed a force to resist the accession of Ali, but the troops under her were in 656 defeated by Ali, and she was taken prisoner. She died at Medina (677 A.D.), highly venerated by all true Mussulmans, and named the *Prophetess* and the *Mother of Believers*.

Aylesbury, the chief town of Buckinghamshire, in a fertile vale, on a rivulet flowing to the Tame, 43½ miles NW. of London. Among its buildings are the cruciform parish church, finely restored by Sir G. G. Scott (1849-67), the corn exchange and markets (1865), and the county infirmary (1862). The inhabitants are engaged in making bone-lace and straw-plait, in brewing, in the preparation of dairy-produce, and in rearing fat ducks to supply the London markets at an early period of the season, when they fetch very high prices. Aylesbury is a very ancient town, having been taken from the Britons by the Saxons in 571. Till 1885 it formed with its hundred a parliamentary borough, returning two members to parliament. Pop. of town (1881) 7795.

Aylesford, a village near the centre of Kent, on the right bank of the Medway, 3¼ miles NW. of Maidstone. Remarkable ancient remains are found here, including the cromlech, called Kite Coity House (q.v.)—a small truncated pyramidal chamber, open in front, and formed of four large rude blocks, three of which are uprights, and the fourth laid on them. Pop. of parish (1881) 2719.

Aylmer, JOHN, Bishop of London, was born in 1521 at Aylmer Hall, Tivetshall St Mary, Norfolk, and in 1541 graduated B.A. of Cambridge. Taking orders, he became tutor to Lady Jane Grey; in 1553 was installed Archdeacon of Stow; in 1562, of Lincoln, having lived abroad during the Marian persecution; and finally, in 1577 was consecrated Bishop of London. Under the designation of 'Morrell,' he is described in Spenser's *Shepherd's Calendar* as the 'proude and ambitious pastoure,'—a fair enough estimate of one who showed equal rigour to Catholics and Puritans, and was always quarrelsome and arbitrary. He died 3d June 1594.

Aymestrey Limestone, a well-marked horizon in the Ludlow group of the Silurian system. It is a somewhat dark-gray concretionary rock, consisting of thin beds which attain a united thickness in places of 150 feet. It is well developed at Aymestrey, in Herefordshire, near Leominster, but thins off entirely at no great distance from that place. One of its most characteristic fossils is *Pentamerus knightii*, a brachiopod.

Aymon, or **HAIMON**, Count of Dordogne, whose sons, Alard, Richard, Guichard, and Renaut, were the chief heroes of one of the finest romances of the Carolingian cycle. The story seems to be originally French, and the first known work in which it is found is the poem, *Regnaut de Montauban*, by Huon de Villeneuve, written before 1200. It occurs in a prose collection of similar stories, published at Lyons about 1480, an English translation of which, most likely by Caxton himself, was printed about 1489 (reprinted from unique imperfect Althorp copy for Early English Text Society, 1884-85). The current German story which Tieck worked up, does not appear to be from the French original, but rather borrowed from a Dutch source. Ariosto's *Roland* has secured the brothers a more certain immortality in the part given to Renaut, the youngest and traditionally the bravest of the four.

Ayr, the county town of Ayrshire, at the mouth of the river Ayr, 40½ miles SSW. of Glasgow by rail. It is a clean and handsome town, the principal streets well built; while to the south, towards the racecourse, many elegant villas have sprung up of recent years. The Town's Buildings, with a spire 226 feet high, were erected in 1823, and greatly enlarged in 1881. The so-called 'Wallace Tower' is a Gothic edifice of 1834, 113 feet high. There are also the County Buildings, modelled after the temple of Isis in Rome, and the Academy (founded 1764; new building, 1880). Three bridges span the river, and connect Ayr proper with Newton-upon-Ayr and Wallacetown—a railway viaduct, and the 'Twa Brigs' of Burns. Of these the narrow four-arched 'Auld Brig' dates probably from the end of the 15th century, and the 'New Brig' (1788) was rebuilt in 1879. There are bronze statues of General Smith Neill and the thirteenth Earl of Eglinton, erected in Wellington Square. Part of the tower of the old church of St John, built in the 12th century, and turned into a fort by Cromwell, is still standing. The harbour is formed by the estuary of the river, and protected by piers and a breakwater; improvements on it, including a wet dock and slip dock, have been carried out since 1874 at a cost of more than £150,000. The trade is a large and growing one, the tonnage of vessels entering the port having increased in ten years from 140,000 to 328,000. The chief export is coal from the Ayrshire collieries. A considerable quantity of grain and timber is imported; and there are manufactures of lace and woollen fabrics, carpets, large saw-mills, &c. A splendid new water-supply, drawn from Loch Finlas, 20 miles distant, was introduced in 1887. At an early date Ayr was a commercial and military place of some importance. William the Lion made it a royal burgh about 1200. During the War of Independence, it formed a regular centre of military operations, and in 1297, while in possession of an English garrison, it was the scene (according to Blind Harry) of the burning by Wallace of the 'Barns of Ayr.' The principal objects of interest near Ayr are connected with the memory of Robert Burns (see ALLOWAY). Ayr unites with Campbeltown, Irvine, Inveraray, and Oban in sending a member to parliament. The municipal burgh was in 1873 rendered conterminous with the parliamentary, so as to take in Newton and Wallacetown, and was again extended in 1885. Pop. of parliamentary burgh (1841) 15,749; (1861) 18,573; (1881) 20,821; (1891) 23,835.

Ayrshire, a large maritime county in the SW. of Scotland, washed on the W. by the Firth of Clyde and the North Channel. Its greatest length is 78 miles; its greatest breadth, 28; and its area is 1149 sq. m., or 735,262 acres, it being seventh in size of the Scottish counties. The

general aspect of the county is undulating and hilly, the land attaining no great elevation, except a small portion in the north, and some considerable tracts in the south and south-east, which are mountainous. None of the eminences exceed 2520 feet, which is the height of Shalloch on Minnoch. Loch Doon (5½ × ¾ mile) is much the largest of several fresh-water lakes; whilst the chief rivers—only 20 to 38 miles long—are the Ayr, with its tributary the Lugar, and the 'bonny' Doon, which flow across the centre of the county; the Garnock and Irvine in the north; and the Girvan and Stinchar in the south. To Ayrshire belong, too, the first 16 miles of the Nith, which passes off into Dumfriesshire. To the south of the Girvan the rocks are chiefly Silurian; to the north of it are patches of old red sandstone and carboniferous strata, with both of which igneous rocks are commonly associated. Ayrshire is rich in valuable minerals, especially coal, ironstone, limestone, and freestone. The other minerals have long been wrought, but it was from 1850 that the iron trade rose to great importance, again to decline since 1880. On the banks of the Ayr is found an excellent species of whetstone, called Water-of-Ayr Stone. The climate of Ayrshire is mild and healthy. The soil along the coast is light and sandy, interspersed with deep loam; the most fertile districts are in the centre of the county, where clay predominates. On the east side are extensive mosses and moorlands. The three ancient divisions of the county are—Carrick, south of the Doon, mostly wild and hilly; Kyle, between the Doon and the Irvine, containing much rich level land, though towards the coast the soil is lighter and less productive; and Cunninghame, comprising all the country north of the Irvine, mostly fertile. Agriculture till 1800 was very backward; but since then extraordinary progress has been made in draining, improved rotation, and road-making; while the condition of the cottars has been much improved. There is a great trade in early potatoes. The percentage of cultivated area is 43·2, that of all Scotland being 23·5; and 22,177 acres are under wood. The farms are generally small. Dairy-husbandry is carried to high perfection in Ayrshire, the breed of milch-cows, of which it rears a greater number than any other Scotch county, being noted as the finest in the kingdom for the quantity and quality of their milk. The Dunlop cheese, so called from the parish of that name, was almost as celebrated as Stilton, but since 1855 has been almost superseded by that made on the Cheddar process. The breed of horses is also excellent. Manufactures, especially woollen and cotton, are carried on to an important extent. There are extensive cotton-works at Catrine; at Kilmarnock, iron-foundries, carpet, bonnet, and tweed factories; dynamite and chemical works near Saltcoats; and at Galston and Newmilns much lace is manufactured. Of the minor manufactures, the most characteristic is that of ornamental wood-work, often bearing tartan designs, which is extensively carried on at Mauchline. Great iron-works exist at Muirkirk, Hurlford, Kilwinning, Kilbirnie, Ardeer, Dalry, and Dalmellington. Ayr and Maybole manufacture shoes and agricultural implements in very large quantities. There are valuable fisheries on the coast, whose headquarters is Ballantrae. Troon, Ardrossan, and Ayr are thriving ports. Pop. (1801) 84,207; (1881) 217,504; (1891) 224,222. Ayrshire returns two members to parliament. The chief towns, besides Ayr, are Kilmarnock, Girvan, Maybole, Dalry, Kilwinning, Beith, Irvine, Stewarton, Old Cumnock, Ardrossan, Saltcoats, Troon, Mauchline, Galston, Newmilns, Kilbirnie, and Largs. Of antiquities, the most interesting are the ruins of Crossraguel and Kilwin-

ning Abbeys; of 'Alloway's haunted kirk,' with the 'auld clay biggin,' Burns's birthplace, hard by; and of the castles of Turnberry (the family seat of Robert the Bruce), Dunure, Loch Doon, Dean, Dundonald, &c. Ayrshire was inhabited in the time of Agricola by the Damnonii, with whom were afterwards mixed the Scots from the opposite coast of Kintyre. It contains the battlefields of Largs and Loudon Hill; and during the religious persecutions of the Stuarts, it was a stronghold of the Covenanters. See James Paterson's *History of Ayrshire* (2 vols. 1847-52), and A. Millar's *Castles and Mansions of Ayrshire* (1885).

Ayrer, JACOB, next to Hans Sachs the most prolific and important German dramatic writer of the 16th century. His history is involved in obscurity; but it is known that he was a citizen of Nuremberg in 1594, and a procurator in the courts of law. His rhyming chronicle of the town of Bamberg was edited by I. Heller in 1838. It was not till after his death, in 1605, that a collected edition of his dramatic pieces was published under the title *Opus theatricum*, consisting of sixty-six tragedies, comedies, and carnival plays (Nurem. 1618). He took his subjects from history, legend, and novels; some pieces are based on English plays. Ayrer has the same garrulous breadth of dialogue as Hans Sachs, but is inferior to him in wit and humour. See K. Schmitt, *Jacob Ayrer* (Marburg, 1851).

Ayton, SIR ROBERT, Scottish poet, was born at Kinaldie, Fife, in 1570, and entering St Leonard's College, St Andrews, in 1584, took his M.A. degree in 1588. For purposes of study he next visited France, whence he addressed, in 1603, an elegant Latin panegyric to King James, on his accession to the throne of England. This poem was the making of Ayton's fortune, for we find him appointed, successively, a gentleman of the bedchamber, private secretary to the queen, and master of requests—posts all continued to him in the following reign. He was knighted in 1612, and employed to convey copies of King James's *Apology for the Oath of Allegiance* to the German courts. Ayton was on terms of familiarity with all the poets, wits, and philosophers of his time—among others, Hobbes and Ben Jonson. He was himself a poet of considerable merit; but, unfortunately, a large number of his effusions being complimentary verses to his friends, are characterised by conceit and extravagant flattery. He was one of the first Scotsmen who wrote in English with any degree of elegance and purity. 'I do confess thou'rt smooth and fair,' and the prototype of 'Auld Lang Syne,' have been ascribed to him, but on scant authority. He died at Whitehall Palace, February 1638. See his *Poems*, with a Memoir by Dr Charles Rogers (1871).

Aytoun, WILLIAM EDMONDSTOUNE, born in Edinburgh, 21st June 1813, was educated at the Academy and the university, and for some months studied German at Aschaffenburg. In 1835 he became, like his father, a Writer to the Signet, and in 1840 was called to the Scottish bar. To his mother he owed his love of ballad-lore and Jacobitism, and, taking early to literary work, he entered in 1836 on his lifelong connection with *Blackwood's*; in 1845 was appointed professor of Rhetoric and Belles-Lettres in Edinburgh University, and in five years increased the number of his hearers fivefold. In 1849 he married a daughter of Professor Wilson; in 1852 was made sheriff of Orkney; and next year received from Oxford the honorary degree of D.C.L. His first two published works—*Poland, Homer, and Other Poems* (1832), and *The Life and Times of Richard I.* (1840), were succeeded in 1848 by *Lays*

of the *Scottish Cavaliers*, which established his reputation as a poet of the school of Sir Walter Scott, and which has run through thirty editions. The *Bon Gaultier Ballads*, a series of capital parodies (1855), were produced conjointly with Theodore Martin, as also were *Poems and Ballads of Goethe* (1858). Other works by him were *Firmilian, a Spasmodic Tragedy* (1854), which is almost too good for a parody; *Bothwell*, a long narrative poem in the measure and manner of Scott; an edition of the *Scottish Ballads* (2 vols. 1858); and *Norman Sinclair* (1861), a semi-autobiographical novel. Aytoun was successful in quite opposite branches of literature—at once as a poet and humorist. His poems exhibit a ballad-like simplicity, and a fiery flow of narration; while his tales possess a certain robust humour and farcical abandonment. His poetical powers appear in their greatest perfection in the *Lays of the Scottish Cavaliers*; the special merits of his humour in *The Glenmutchkin Railway* and *How I became a Yeoman*. As a critic, he took up the knout of 'Christopher North,' which he wielded with no little force and dexterity. He died at Blackhills, near Elgin, 4th August 1865. See his *Life* by Sir Theodore Martin (1867).

Ayuntamiento is the name given in Spain to the councils or governing bodies of towns. Sprung from the institutions of the Romans, and firmly established during the long struggles with the Moors, the ayuntamientos acquired great influence and political power, the nobility being admitted to them without their class privileges. Although this importance was gradually impaired, and under the Bourbons the last shadow of municipal freedom was lost, the remembrance of it continued to be cherished by the people. Accordingly, the cortes, in 1812, adopted the leading features of the former system. On the return of Ferdinand VII., the ayuntamientos were abolished; restored in 1823; after the invasion by France, once more set aside; and again restored in 1837. The ayuntamiento, with the alcalde as president, was appointed by the free choice of the people. The government could provisionally annul its acts, but must afterwards procure the ratification of the cortes. The ayuntamientos were empowered to make up the lists of electors and jurors, to organise the national guards, to command the police within their own bounds, to direct the apportionment and raising of taxes, and to manage the funds of the commune. Subsequently they have been more than once modified, not without opposition, especially after the events of 1843. The municipal law of 1870 deprived them of all political authority, and regulated them as administrative bodies, subject in certain respects to the authorities of the provinces, the law courts, and the cortes.

Ayuthia, the ancient capital of Siam, stands on the Menam, 50 miles N. of Bangkok. It was founded in 1357, and was the capital until 1767, when it was sacked and half destroyed by the Burmese. In the 16th century it was three leagues in circumference, and was till recently the second city of the kingdom. It is now called Krung-Krao, and is mainly built in piles over the water. Some magnificent buildings still remain, now crumbling into ruins and overgrown with luxuriant vegetation; notable amongst them are Buddhist temples, especially the 'Golden Mount,' 400 feet high.

Aza'lea, a genus of the heath order (Ericaceæ), and distinguished from *Rhododendron* (q.v.) chiefly by the flowers having five stamens instead of ten. Most of the species of azalea also differ from the *rhododendrons* in having the leaves thin and deciduous instead of evergreen. Perfectly intermediate

forms have now been discovered, and by classifiers the two genera are therefore united under rhododendron; the distinction, however, remains one of practical convenience. One of the species best deserving of notice is *A. pontica*, a shrub from 3 to 5 feet high, a native of Asia Minor, with lanceolate shining leaves and umbellate yellow flowers, which are externally covered with glutinous hairy glands, and are very fragrant. It may be regarded as, like many of the other Ericaceæ (heaths, &c.), a social plant; and its golden flowers give great brilliancy to the landscape in many parts of the Crimea, the south-east of Poland, the Caucasus, &c. It covers many mountain slopes, but does not ascend to great elevations, giving place to the more alpine *Rhododendron ponticum*. It is common in gardens and shrubberies in Britain, and varies with orange, red, and almost white flowers. The whole plant is narcotic and poisonous, and the honey collected by bees from its flowers, which greatly abound in honey, is said to cause stupefaction and delirium, as happened to Xenophon's soldiers in their famous retreat in Asia.—North America abounds in azaleas as well as in rhododendrons, and some of the species have been long cultivated in Britain, particularly *A. nudiflora* and *A. viscosa*, which, with *A. pontica*,

Flowering branch of Azalea (*Azalea liliiflora*).

have become the parents of many hybrids. Both have nearly white flowers, very beautiful, and of delicious fragrance. *A. viscosa* has the flowers covered with glutinous hairs like *A. pontica*; but the flowers of *A. nudiflora* are nearly destitute of them. Both species abound from Canada to the southern parts of the United States. They are taller shrubs than *A. pontica*. Upon account of its sweet smell, *A. nudiflora* is called in America the Upright Honeysuckle. *A. calendulacea*, a native of the southern parts of the United States, is described as frequently clothing the mountains with a robe of living scarlet.—India and China produce several species of azalea, of which one of the finest is *A. indica*, well known in Britain as a greenhouse shrub. Its leaves are persistent, and its flowers exhibit great brilliancy of colours. Many hybrids exist between the more hardy species and this. Another extremely beautiful species is *A. liliiflora*, an evergreen, which has been introduced into Britain from China, and is said to be quite hardy.

A diminutive, procumbent, evergreen heath, a native of alpine regions in Europe and North America, plentiful on high mountains in Scotland, was long known as *A. procumbens*, but is now called *Loiseleuria procumbens*. The flowers are small, solitary, and rose-coloured. The whole habit of the plant widely differs from that of the ordinary azalea.

Azamgarh, or AZIM'S FORT, a town in the North-west Provinces of India. The town is situated on the river Tons, 81 miles N. of Benares. It was founded in 1665 by Azam Khan, a large landholder in the neighbourhood. The Europeans here were compelled to flee during the Mutiny of 1857; the native infantry murdered their officers, and carried off the treasure to Fyzabad. Pop. of town, 16,000, of whom about 10,000 are Hindus, the rest Mohammedans.—The district of Azamgarh in the Benares division, is low and remarkably level. The soil is fertile, excepting that tracts, amounting to more than a quarter of the whole, are irreclaimably barren, from being impregnated with soda, nitre, and other saline substances. Magnificent crops of rice, sugar-cane, and indigo are produced. Sugar, molasses, indigo, opium, and coarse cloths are the chief exports; the Gogra River forming the principal highway for trade. Area of district, 2147 sq. m.; pop. (1872) 1,531,482; (1881) 1,604,654, or about 747 persons per sq. m., which is a high average. In religion about 1½ millions are Hindus, and 200,000 Mohammedans.

Azazel, a name occurring in Leviticus xvi., in the account of the rites of the Day of Atonement, explained by some as the 'scapegoat' which was led out into the wilderness laden with the sins of the people; by others, with much greater likelihood, as a designation of the being to whom the goat was sent—Satan, according to Hengstenberg, or a demon of the pre-Mosaic religion, according to Ewald.

Azeglio, MASSIMO TAPARELLI, MARCHESE D', famous as an artist, a publicist, a romance-writer, and a statesman, was the descendant of an ancient and noble family of Piedmont. He was born in 1798 at Turin, where his father held a high military position. In his fifteenth year, he followed his father to Rome, where he had been appointed ambassador, and there became passionately devoted to the fine arts; but had to accept an appointment in a Piedmontese cavalry regiment. Here he devoted his leisure with such intensity to scientific pursuits, that he brought on an illness which forced him to quit the service. After some difficulty, he got his father's permission to devote himself entirely to painting. A year had hardly elapsed ere Azeglio had made himself a name in Rome as a landscape-painter. On the death of his father in 1830, he went to Milan, and made the friendship of Alessandro Manzoni, whose daughter he married. He now began to make himself favourably known also in literature, his novels, *Ettore Pieramosco* (1833) and *Niccolò de' Lapi* (1841), having done much to fan the national spirit of the Italians. The political affairs of Italy soon occupied him exclusively; he traversed the provinces, cities, and villages, seeking to stir up the spirit of patriotism, and to conciliate the unhappy party divisions, and was everywhere received with rejoicing and acclamation. Azeglio never belonged to a secret political society, but opposed conspiracies as mischievous, and exhorted the impatient to moderation. While in Florence, he wrote his famous piece, *Degli ultimi casi di Romagna*, in which he lashed the miserable papal government, denounced the vain attempts at insurrection, and proved to the Italian princes the necessity of a national policy. After the election of Pius IX. as pope, he returned to Rome, and to his influence were ascribed the reforms with which Pius began his government. When Charles Albert, after the rising of Lombardy, crossed the Ticino, Azeglio left Rome with the papal troops destined to support the Italian contest. In the battle of Vicenza, where he commanded a legion, he was severely wounded. Scarcely was he recovered,

when with his pen he courageously opposed the republican party, now intoxicated with victory. On the opening of the Sardinian parliament, he was chosen a member of the Chamber of Deputies. After the unfortunate event of the battle of Novara, the young king, Victor-Emmanuel II., appointed him (1849) president of the cabinet, and his influence in this high position was most beneficial. At the close of the war in 1859, Azeglio was for a time military commissioner extraordinary for the Roman States. On his retirement he issued a proclamation to the people, which greatly tended to strengthen their resolution by its noble yet temperate advice. He died 15th January 1866. He wrote many works, mainly on public questions, and his political correspondence and an autobiographical work, *I miei Ricordi*, were published after his death. See the Lives by Pavesio (1871) and Bianchi (1894).

Azerbaijan, or **ADERBAIJAN**, the ancient *Media Atropatene*, is the north-western province of Persia, bounded S. by Persian Kurdistan and Irak, E. by Ghilan, N.E. and N. by Russian territory, and W. by Turkish Kurdistan. It has an area of about 40,100 sq. m., and a pop. of 2,000,000. The surface of Azerbaijan is very mountainous, many of the ranges rising from 7000 to 9000 feet in height. The peak of Savalan (an extinct volcano), near Ardebil, reaches an elevation of over 13,000 feet. Mount Ararat rises on the north-west border. The chief rivers are the Aras or *Arazes*, the Kara Su, and the Kizil-Uzen. The salt lake Urmia (q.v.), the largest in Persia, is situated near the western border of the province. The climate of Azerbaijan is not unhealthy, but it is subject to rapid extremes of heat and cold. In the mountainous districts, the hail-storms are occasionally so violent as to kill cattle. The principal products are rice, barley, wheat, maize, flax, hemp, cotton, tobacco, honey, and saffron; camels, horses, cattle, and sheep are also reared; velvet, silks, stuff, carpets, woollens, and leather are the most important articles of manufacture, and a little is done in hardware. Lead, iron, copper, sulphur, saltpetre, and salt are found in the province. The capital is Tabriz; other towns being Urmia, Maragha, Miana, Khoi, Selmas, and Ardebil.

Azimuth. The azimuth of a heavenly body is the angle measured along the horizon between the north or south point, and the point where a circle, passing through the zenith and the body, cuts the horizon. It is usual to measure the azimuth westward from the point most remote from the elevated pole, beginning at 0°, and returning to it at 360°. Thus, in northern latitudes, where the north pole is elevated, the azimuth is measured from the south point, so that the east point, for instance, has an azimuth of 270° (see **ARMILLARY SPHERE**). The azimuth circles are those which extend from zenith to nadir, cutting the horizon at right angles, or those in which all the points have the same azimuth. The word is from the Arabic.

Azoic (Gr. *a*, 'without,' *zōē*, 'life'), a term applied in geology to rocks which contain no fossils. By those who deny the organic origin of Eozoön (q.v.), the archæan crystalline schists (which underlie the oldest fossiliferous strata) form the azoic system. See **ARCHÆAN SYSTEM**.

Azores, or **WESTERN ISLANDS**, a Portuguese archipelago in the mid-Atlantic, between 36° 55' and 39° 55' N. lat., and between 25° 10' and 31° 16' W. long. Stretching over a distance of 400 miles, their nine islands are divided into three distinct groups—*São Maria* and *São Miguel* in the SE.; *Terceira*, *São Jorge*, *Pico*, *Graciosa*, and *Fayal* in the middle; and *Flores* and *Corvo* in the NW. Of

these, *Flores* lies 1176 miles W. of Cape Roca in Portugal, 1484 SW. of Falmouth, and 1708 ESE. of Halifax. In 1431–53 the Azores were taken possession of by the Portuguese. They were at that time uninhabited; but that they had been visited by the Carthaginians is proved by Punic coins found on *Corvo*. They seem to have been known to the Arabian geographer Edrisi in the 12th century; and they are marked distinctly on a map of 1351. The Portuguese colonists called the whole group Azores, from *azor* or *azor*, a hawk; and they named two individual islands *Corvo* and *São Jorge*, from *Corvi* *Marini* and *San Zorze*, which, according to a map of 1375, had been previously seen in the western ocean. In 1466 Alfonso V. made a life-grant of the island of *Fayal* to his aunt, the Duchess of Burgundy, and from this circumstance many settlers migrated thither from Flanders. For the fight of the *Revenge*, the Azores' best memory for Englishmen, see **GRENVILLE** (**SIR RICHARD**).

The total area of the group is 919 sq. m., and the pop. (1881) 269,401. The area, population, and the maximum altitude of the different islands are as follows: *São Maria* (38 sq. m.; 5880; 1889 feet); *São Miguel* (299 sq. m.; 107,000; 3854 feet); *Terceira* (164 sq. m.; 45,391; 3435 feet); *Graciosa* (24 sq. m.; 8718); *São Jorge* (91 sq. m.; 18,000); *Pico* (173 sq. m.; 27,904; 7613 feet); *Fayal* (69 sq. m.; 26,264); *Flores* (54 sq. m.; 10,700; 3087 feet); *Corvo* (7 sq. m.; 1000). The capital is *Angra*, in *Terceira*; but *Ponta Delgada*, in *São Miguel*, is a larger town. The Azores are of volcanic origin, and with the exception of *Corvo*, *Flores*, and *Graciosa*, are still liable to eruptions and violent earthquakes, the worst of twenty-one shocks since 1444 having been those of 1591, 1638, 1719, and 1841. Hot mineral springs are numerous; and the baths of *Furnas*, in *São Miguel*, are much resorted to by invalids. The coast is generally steep and rugged; the interior abounds in ravines and mountains. As may be presumed from the density of the population, the soil is fertile, and the climate healthy. The islands are also admirably watered. From 80 to 90 per cent. of both fauna and flora are decidedly European; and only of the land molluscs are 60 per cent. indigenous. Oranges are the chief article of export, besides wine, brandy, grain, pulse, pork, beef, cheese, and coarse linens; the imports include woollens, cottons, hardware, iron, glass, cordage, pitch, tar, staves, timber, oil, fish, rum, coffee, sugar, salt, and tea. Perhaps the greatest want of the group is a good harbour. The Azores are regarded as a province, not a colony, of Portugal, and as belonging to Europe. See **Godman's Natural History of the Azores** (1870), and **W. F. Walker's Azores** (1886).

Azo'te (Gr. *a*, 'without,' and *zōē*, 'life') is the name given by French chemists to Nitrogen (q.v.).

Azotised Bodies are those substances which contain azote or nitrogen as one of their constituents, and which form part of the living structure of a plant or animal, or are produced during its natural decay. The principal members of the group are *albumen*, present in white of eggs and the juices of plants and animals; *globulin*, or *crystallin*, a variety of albumen found in the lens of the eye; *vitellin*, another variety of albumen, composing the greater bulk of the yolk of the egg; *paralbumen*, a third variety of albumen found in the animal system during certain diseases; *fibrin*, which occurs largely in the seeds of cereals and in animal muscle; *casein* (or cheese matter), present in all milk; *legumin*, a variety of casein found in pease, beans, and leguminous seeds in general; *gelatin*, which is present in the skin, bones, and

other parts of animals; *chondrin*, a variety of gelatin obtainable from the cornea of the eye and the permanent cartilages; *isinglass*, another variety of gelatin manufactured from the inner membrane of the floating bladder of sturgeons and other fishes; *glue* and *size*, which are secondary forms of gelatin; *urea*, *uric acid*, and *hippuric acid*, which are present in the urine of the higher animals; *kreatin* and *kreatinin*, occurring in the juice of flesh; several forms of *urinary calculi*, which are found as stones in the bladder; and the very large and important class of *alkaloids*, including strychnine, morphine, quinine, &c. The principal members of the series of azotised bodies will be considered under their special headings; and the use of several of them as articles of diet will be noticed under FOOD.

Azo'tus. See ASHDOD.

AZOV, a town in the south of Russia, on the left bank of the Don, 7 miles from its mouth. The sand and mud deposited by the river have choked up the port, so that its trade and shipping have dwindled away, and the inhabitants depend mostly on fish-curing. Pop. (1881) 18,738. Azov was built 9 miles from the site of the ancient Greek colony of *Tanaïs*; and, when in the 13th century it was taken possession of by the Genoese, they altered its name to *Tana*. They were driven out of it by Timur (Tamerlane) in 1392. In 1471 it was taken by the Turks, and in 1696 by Peter the Great; and to Russia it was finally ceded in 1774.

AZOV, SEA OF, named after the town, is a large gulf of the Black Sea, formed by the Crimean peninsula, or rather an inland lake connected with the Black Sea by the Strait of Yenikale or Kertch (anc. *Bosporus Cimmerius*), 28 miles long, and barely 4 wide at the narrowest. The intricate Siwash or Putrid Sea, which is just a succession of swamps, is cut off from the western portion of the Sea of Azov by the long narrow slip of low sandy land called the Peninsula of Arabat. The ancient name of the Sea of Azov was *Palus Mæotis* or 'Mæotic Marsh,' from the Mæotæ dwelling on its shores; by the Turks it is called *Balik-Denghis*, or 'Fish Sea,' from its abundance of fish. The water is almost fresh. The whole sea is shallow, from 3 to 52 feet deep; and measuring 235 by 110 miles, it occupies an area of 14,500 sq. m. The largest river emptying into it is the Don. During the Crimean war, an expedition, having on board 16,500 English, French, and Turks, was sent to this sea in May 1855, which bombarded the ports, and cut off supplies intended for Sebastopol.

Azpeitia, a town in the Spanish province of Guipuzcoa, situated in a fine valley on the Urola, 18 miles SW. of San Sebastian. A mile from it is the famous convent of Loyola, now converted into a museum, built somewhat in the form of an eagle with outspreading wings by the Roman architect, Fontana, in 1683. It comprises a tower of the Santa Casa, in which St Ignatius of Loyola, the

great founder of the Jesuits, was born in 1491. Here every year in July a great festival is held in his honour, to which pilgrims flock from all quarters. Pop. 6386.

Azrael forms in Moslem Mythology, together with Gabriel, Michael, and Israfil, the group of four highest angelic beings who surround the throne of God. Called the 'Angel of Death,' it is he who 'separates men's souls and bodies,' and with his assistants either 'tears them asunder with violence, or draws them apart with gentleness.' He is sent by Allah, and executes his commissions, having been promoted to his high office for his faithfulness and fearlessness. No idea of degradation is attached to him in the Moslem mind—he seems rather to have been identified with Fate, without any special malignant quality inherent in his nature. The Jewish rabbins have added to this awful figure the attributes of an evil genius, and 'the king of terrors,' the last enemy of man, in their conceptions has become almost the supreme embodiment of evil.

Aztecs, the name of the dominant tribe in Mexico at the time of the arrival of the Spaniards. See MEXICO.

Azu'ni, DOMENICO ALBERTO, a distinguished jurist, born at Sassari, in Sardinia, in 1749. He became judge of the Tribunal of Commerce at Nice; and in 1795 published a work in which he endeavoured to reduce maritime laws to fixed principles, and which appeared in French in 1805 under the title of *Droit Maritime de l'Europe*. Napoleon appointed him one of the commissioners for compiling the new commercial code. In 1807 he was appointed president of the Court of Appeal at Genoa. He published other minor works on maritime law, and a book on Sardinia. Ultimately he received a post at Cagliari, where he died 23d January 1827.

Az'ure, a French word technically used in Heraldry to signify blue. In engraving arms, it is always represented by horizontal lines.

Azurine (*Leuciscus cæruleus*), or BLUE ROACH, a fish of the same genus with the roach, chub, dace, minnow, &c., and most nearly resembling the Red-eye (q.v.) or Rudd (*L. erythrophthalmus*), from which it is distinguished by the slate-blue colour of the back, and the whiteness of the abdomen and fins. It is a fresh-water fish. It is very probably only a variety of the latter, very rare in Britain, but not uncommon on the Continent—e.g. in some of the Swiss lakes.

Azurite, a name which has been given to the mineral more commonly called Lazulite (q.v.), and to which, along with Lapis Lazuli (q.v.) or *Azure-stone*, mineral turquoise (see TURQUOISE), &c., the generic name, *Azure Spar*, is sometimes given.—The name azurite is also given by mineralogists to an ore of copper, generally known as *Blue Copper* or *Chessylite* (see COPPER), nearly allied to Malachite (q.v.), and remarkable for its beautiful azure colour.

B

is the second letter of our own alphabet, and a corresponding and related symbol occupies the same place in the Greek, Hebrew, Arabic, and other alphabets. Derived ultimately from the hieroglyphic picture of a crane, it was called, when taken over by the Phœnicians,

beth, 'the house,' whence came the Greek name *beta*, which we retain in the last syllable of the word *alpha-bet*. In the Aramean alphabets the loop of the Phœnician form gradually opened out, and finally disappeared, giving the square Hebrew and the Arabic forms shown in the table on p. 187, article ALPHABET. In the Greek alphabet the tail was bent round, forming a second complete loop, as in our capital B, out of which the Greek minuscule *β* easily arose as a cursive form. Our minuscule *b* comes from the cursive Latin, this form being found as early as the 1st century A.D. scribbled on Pompeian walls. From the Roman cursive it was adopted into the Irish semi-uncial, whence it passed in the 7th century into England, and in the 9th century into the French or Caroline minuscule, thus becoming the source of the Roman *b* of our printed books. It arose through the upper loop of B being left incomplete, as is shown by the intermediate form, *β*. In our *b* the loop of the primitive letter has disappeared, while in the Indian form this loop is all that remains. In the alphabet of ancient Corinth we find a form, *S*, which approaches very closely to that of the Egyptian Hieratic prototype. Phonetically, B may be defined as the soft labial mute.

Owing to physiological causes, *b* may exchange with *m*, *p*, *v*, or *f*. Thus the Greek *brotos* corresponds to the Latin *mortalis*, and the Gaelic *beinn* is the Cymric *pen*. Again, *episcopus* has become *bishop* in English and *évêque* in French, while the English *bear* corresponds to the Latin *ferre*. About the 4th century, *b* in Latin and Greek was very commonly softened down to *v*, which explains how the French *avoir* arose out of *habere*, and the Italian *tavola* out of *tabula*. The physiological causes of these changes will be explained in the article LETTERS.

B, in Music, is the seventh degree of the diatonic scale of C. According to the tempered system of tuning, the ratio of B to the fundamental note C is $\frac{7}{4}$. In the German notation, B is called H, while B flat is called simply B. See MUSIC.

Baader, FRANZ XAVER VON, a distinguished German philosopher and theologian, born at Munich, March 27, 1765. After taking his degree in medicine, he decided to become a mining engineer, and in the course of his studies resided for four years in England. Here he became acquainted with both the mysticism of Boehme and the rationalism of Hume, the latter of which jarred terribly on his deep sense of the reality of religious truths. Indeed, he regarded all modern philosophy as atheistic in its tendencies, and the ethical autonomy of Kant, that man is in himself a rule of

action, was particularly offensive to him. Baader's philosophical and professional researches were prosecuted simultaneously; and having risen to the post of superintendent-general of mines, he retired in 1820, having been ennobled. In 1826 he was appointed professor of Philosophy and Speculative Theology in the new university of Munich; and here he died, May 23, 1841.—Baader's philosophy draws its inspiration from the writings of Jacob Boehme (q.v.), and is essentially a theosophy, of which the notion of God is the fundamental idea, the divine nature its first problem. His system is based largely on the necessary attributes of God, and displays a devout, religious mind. He holds that the true ethical end is not obedience to a moral law, but a realisation of the divine life; and that as man, alienated from God, has lost the power to attain this, therefore no ethical theory which disregards the facts of sin and redemption can be satisfactory. In developing his system he falls into mystical symbolism, and this, along with his obscure aphorisms, renders his writings, which are not systematic, at times very difficult to understand. He is certainly, however, the greatest speculative theologian of modern Catholicism, and in Germany his influence has extended widely beyond his own church. His complete works have been edited by Hoffmann, and others of his followers (16 vols. Leip. 1850-60). See Pfeleiderer's *Philosophy of Religion* (vol. ii. Eng. trans. 1887).

Ba'al, the principal male deity of the Phœnician and Canaanitish nations, as Ashtoreth was the principal female deity. The Bel of Babylon and Assyria has no identity with the Phœnician Baal beyond the fact that they both bore the title of Bel-Ba'ab, 'lord.' Originally Baal was regarded as a personification of the sun, the ruler and vivifier of nature; but later his sovereignty in the moral world also was conceived. The oldest form of his cultus was a nature-worship on the tops of mountains; thus the Midianites and Amalekites worshipped him on Horeb and Sinai, the Moabites on Mount Peor, the Phœnicians particularly on Carmel, the Canaanites of the interior on Hermon. There were no representations of Baal, but his presence was symbolised by upright conical stones, which in earlier times were erected in the open air, but later in temples, and are supposed to have had a phallic significance. In contrast to Baal, the genial and fructifying power of nature, stood Moloch, the god of the sun in his destructive side, and the personification of the sterner side of nature. Later, both conceptions were united together in the person of Melkart, the supreme god of the Phœnicians. Melkart is usually supposed to mean 'king of the city'—i.e. Tyre; others consider it a contraction of two words signifying 'king of the earth'; while the learned Selden explained it as equivalent to 'strong king.' The Greeks confounded Baal or Melkart with their own Hercules; and for the purpose of distinction, termed him the Tyrian Hercules. From the earliest foundation of Tyre, he seems to have been the tutelary god of that city, and his worship apparently extended thence until it was prevalent in all the towns of the Phœnician

confederation, and was established in their remotest colonies, such as Malta, Carthage, and Cadiz. The worship of Baal, with its genial and festive character, had a powerful fascination for the early Israelites before the idea of a pure monotheism had been fully grasped by the popular imagination. Their defection to the worship of Baal-Peor as early as the close of the journey across the desert is related in the Book of Numbers. And after their settlement in Canaan, they returned to it again and again, placing Baal beside Jehovah, and dividing their worship of their own national God with the indigenous god of the country. The influence of King Ahab and his Syrian wife Jezebel spread it over the northern kingdom, spite of the opposition of the lofty-minded Elijah, but the revolution effected by Jehu finally banished it from Israel.

The word Baal enters into the composition of many Hebrew, Chaldee, Phœnician, and Carthaginian personal and place-names, such as Jezebel, Hadrubal, Hannibal, Ethbaal, Baalbek. The word is also frequently found in conjunction with some epithet, and in such cases appears to have denoted a different deity, though it is not impossible that it may have been the same person regarded in another aspect, and as exercising merely a different function. Thus, we have Baal-Berith ('the Covenant Lord'), who was specially worshipped by the people of Shechem; Baal-Peor, the *Priapus* of the Moabites and Midianites; and Beelzebub, or Baalzebub ('the Fly-god'), the idol of the Philistines at Ekron, where he had a temple.—The Celtic deity Beal was often confounded with Baal by the earlier mythologists.

Baalbek, a ruined city of Syria, 35 miles NNW. of Damascus, and 38 SSE. of Tripoli. The name signifies 'City of Baal,' the Sun-god, and was by the Greeks, during the Seleucid dynasty, converted into Heliopolis. Baalbek lies 4500 feet above sea-level, at the opening of a small valley into the plain of El-Buk'a (Cœle-Syria), on the lowest slope of Anti-Lebanon, a well-watered and delightful locality. It was once the most magnificent of Syrian cities, full of palaces, fountains, and beautiful monuments; now it is famous only for the splendour of its ruins, of which three deserve special notice. The most imposing is that of the Great Temple, which

Ruins of the Great Temple at Baalbek, with the Lebanon Range. (From a Photograph by Frith.)

was a rectangular building, 290 feet by 162, having its roof supported by a peristyle of 54 Corinthian columns, 19 at each side, and 10 at each end. Of these, six are yet standing. The circumference of these columns is 22 feet, and the

length of the shaft 55½; with pedestal, capital, and entablature, they measure 88 feet in height. The approach to this temple was through a portico (40 × 248 feet), a hexagonal hall (193 × 255 feet), and a grand quadrangle (411 × 440 feet). Except the columns mentioned, little of the great temple, or of the buildings in front of it, is left standing, but the ground is covered with their ruins. The vast size of the stones used in the Cyclopean substruction or platform (1052 × 318 feet) is remarkable, three of them being more than 60 feet long and about 13 feet square. South of the great temple is a smaller one, known as the Temple of Jupiter. It is similar in form, having its peristyle and the walls of its cella still mostly standing. Its dimensions are 228 feet in length by 124 feet in breadth, being thus larger than the Parthenon at Athens. Both temples, as well as the surrounding structures, are built of limestone, in a richly decorated somewhat fantastic Corinthian style. Besides these, there stands in the village of Baalbek, at the distance of 300 yards from the others, a circular building, supported on 6 granite columns in mixed Ionic and Corinthian style. Down to the 18th century it was used as a Greek church.

The early history of Baalbek is involved in darkness; but it is certain that, from the most distant times, it had been a chief seat of sun-worship, as its name implies. Julius Cæsar made it a Roman colony, and under Augustus it was occupied by a Roman garrison. Baalbek had an oracle held in such high esteem that in the 2d century A.D. it was consulted by the Emperor Trajan prior to his entrance on the second Parthian campaign. Antoninus Pius (138–161 A.D.) built the Great Temple, which the natives nowadays ascribe to Solomon. This temple is said to have contained a golden statue of the sun-god, which on certain annual festivals the chief citizens of Heliopolis bore about on their shoulders. When Christianity had become the dominant religion, the temple was converted by the Emperor Theodosius the Great into a Christian church. In the wars that followed the taking of the city by the Arabs, who sacked it in 748 A.D., the temple was turned into a fortress, the works of which are yet visible. The city was completely pillaged by Timur Beg in 1400. Both city and temple continued to fall more and more into decay under the misery and misrule to which Syria has been subject ever since. Many of the magnificent pillars were overturned by the pashas of Damascus merely for the sake of the iron with which the stones were bound together. What the Arabs, Tartars, and Turks had spared, was destroyed by a terrible earthquake in 1759. Baalbek is now a wretched village, with a population of some few hundreds. See R. Wood and Dawkins's *Ruins of Baalbec* (1757); Cassas, *Voyage Pittoresque de la Syrie* (1799); two articles by J. C. M. Bellew in *Temple Bar* (1861); and Renan's *Mission de Phénicie* (1864).

Baba ('the old'), in Slavonic Mythology, originally a thunder-witch (the devil's grandmother), was represented like Dame Holle as a little, ugly old woman, with a monstrous nose, long teeth, and dishevelled hair, flying through the sky in an iron mortar. By the Czechs she is called now the iron, now the golden Baba.

Baba, a Turkish word signifying 'father,' originating, like our word *papa*, in the first efforts of children to speak. In Persia and Turkey it is prefixed as a title of honour to the names of ecclesiastics of distinction, especially of such as devote themselves to an ascetic life; it is often affixed in courtesy, also, to the names of other persons, as Ali-Baba.

Baba, CAPE, a bold rocky headland near the western point of Anatolia—the *Lectum* of the Greeks—about 12 miles from the northern extremity of Mitylene, the ancient Lesbos. On a shelving point of the cape stands the town of Baba, with a population of about 4000.

Babatag, or BABADAGH, a city with 7000 inhabitants, in a marshy district of the Roumanian Dobrudja, 2½ miles W. of Lake Razim. The importance of the place has declined since the Dobrudja ceased to be Turkish in 1878.

Babbage, CHARLES, born 26th December 1791, at Totnes, Devonshire, entered Trinity College, Cambridge, in 1811, but graduated from Peterhouse in 1814. Two years later he was elected an F.R.S., and from 1828 to 1838 he filled the sinecure of Lucasian professor of Mathematics at Cambridge. He united, in the most happy combination, powers of invention and observation with thorough scientific culture. Foremost among his eighty writings is his extremely correct and well-arranged *Table of Logarithms* (1827), he being the first to make the method of constructing such tables the object of earnest study. As early as 1812 the idea had occurred to him of a Calculating Machine (q.v.); and by 1822 he had constructed a small model of one. Commissioned by government to superintend the construction of a larger and improved machine, after four years' operations he devoted a twelvemonth to visiting a great many workshops and factories on the Continent, in order to become acquainted with all the resources of mechanical art, and thus be in a position to use them in his great undertaking. This survey afforded him the necessary information for his able work *On the Economy of Manufactures and Machinery* (1832)—a book that in three years ran through four editions, and was translated into four languages. In it all mechanical processes are classified from the most scientific point of view, and the most interesting examples of the more important kinds of manufacture are described. Besides his *Comparative View of the Various Life-Insurance Societies* (1826), *Ninth Bridgewater Treatise* (1837), *Decline of Science* (1831), *The Exposition of 1851* (1851), and the autobiographical *Passages from the Life of a Philosopher* (1864), Babbage contributed many very interesting papers to the Transactions of the Royal Societies of London and Edinburgh. His calculating machine, which cost £6000 of his own money, and £17,000 of the nation's, was abandoned by government in 1842, after eight years of circumlocution, and is now preserved in an unfinished state in the South Kensington Museum. In his later years he was chiefly known by his fierce hostility to organ-grinders, in spite of whom he lived till 18th October 1871.

Babel, TOWER OF. According to the story in Genesis xi., the descendants of Noah journeyed from the east till they came to the plain of Shinar (the Hebrew form of the native name Sumir—or Sungir, as it was pronounced in the allied dialect of Accad—the southern half of pre-Semitic Babylonia), and there they impudently began to build a tower of burned bricks and bitumen, whose top might reach unto heaven. But Jehovah confounded the language of the builders, so that they could not understand each other, and scattered them over the face of the earth, wherefore the tower was called *Babel*, or 'confusion,' from the Hebrew *balbel*, 'to confound.' This etymology, however, is an example of the periphrasia so frequent in the Hebrew text of the Old Testament; Babel is really the Assyrian *Bab-ili*, 'the gate of God,' which is merely a Semitic translation of the old Accadian (or rather Sumerian) name of the town Ca-dimira, where Ca

is 'gate,' and *dimira*, 'God.' There appears to be no reference to the story in Berosus, and no certain representation of it has been found on any of the Babylonian gems, but George Smith discovered some fragments of a cuneiform text affording a marvellously close parallel to the account in Genesis. According to this version, certain men under a leader, 'the thought of whose heart was evil,' and who had 'repudiated the father of all the gods,' began to build at Babylon a 'mound' or hill-like tower, but the winds blew down their work, and Anu 'confounded great and small on the mound,' as well as their 'speech,' and 'made strange their counsel.' It is Bel, 'the father of the gods,' whose anger is stirred up against the impious builders; but it is the god Anu who destroyed them, and is accordingly called 'king of the illustrious mound.' The builders of the Tower of Babel intended to scale the sky, like the giants and Titans of Greek mythology, whose assault on heaven and discomfiture by Zeus may be but an echo of the old Babylonian tale—conveyed to Greece by the Phœnicians. Chaldean tradition assigned the building of the tower and the subsequent confusion of languages to the time of the autumnal equinox, and it is possible that the mythical hero Etana of the Izdubar legends, who, according to an obscure fragment, builds a city in defiance of the gods, may have been the leader 'the thought of whose heart was evil.'

With reference to the site of the Tower of Babel, nothing more is certain than that it was somewhere in Babylon. It is usually supposed to be represented by the great pile of Birs Nimroud, which stood in Borsippa, the suburb of Babylon, 8 miles distant, and was dedicated to Nebo and called 'the Temple of the Seven Lights' or planets. Sir Henry Rawlinson discovered that it consisted of seven stages of brickwork on an earthen platform, each stage being of a different colour. Its north-west, south-east, north-east, and south-west sides are 643, 643, 420, and 376 feet long respectively, and its ruins still rise 153 feet above the level of the plain. It had long stood unfinished when Nebuchadnezzar undertook to restore and finish it. Schrader thinks that the long period during which it had remained an unfinished ruin caused the growth of the legend which saw in it a monument of the overthrow of human presumption, the diversity of languages spoken in the plain of Mesopotamia being sufficient to account for the localisation of the story of the confusion of tongues in that country. Another site proposed is at the ruins now called Amram, within the city of Babylon itself. The mound here is 1100 yards in length and 800 in breadth. See Sayce's edition of George Smith's *Chaldean Account of Genesis* (1880); vol. i. (1882) of Lenormant's *Les Origines de l'Histoire d'après la Bible*; and Sayce's *Fresh Light from the Ancient Monuments* (3d ed. 1886).

Bab-el-Mandeb (i.e. 'the gate of tears'), so called from the danger arising to small vessels from strong currents, is the name of the strait between Arabia and the continent of Africa, by which the Red Sea is connected with the Gulf of Aden and the Indian Ocean. The Arabian peninsula here throws out a cape, bearing the same name as the strait, rising to the height of 865 feet. About 20 miles distant from this cape stands the wall-like coast of Africa, rising in Ras es Sean to the height of over 400 feet. Within the straits, but nearer to Arabia, lies the bare rocky island of Perim (q.v.), since 1857 occupied by the British as a fort; its guns command the entrance to the Red Sea. The strait on the east side of this island is called the Little Strait, and that on the west the Great Strait.

Bab'er (Zehir-Eddin Mohammed), the first of the Great Moguls in India, a descendant of Timur, was born in 1483. He was barely 12 years of age when he succeeded his father, Omar Sheikh Mirza, in the sovereignty of the countries lying between Samarkand and the Indus. Driven more than once from his paternal dominions by the usurpation of his uncle and the revolts of his nobles, he made himself master, by prompt and daring movements, of the provinces of Kashgar, Kunduz, Kandahar, and Kabul. Having thus opened the way to India, he made two or three rapid incursions into Hindustan; and finally, about the end of 1525, taking advantage of the feeble government of Ibrahim Lodi, the Afghan emperor of Delhi, he crossed the Attock (the Kabul branch of the Indus), quickly defeated some bodies of troops that opposed him in the Punjab; and at last, in April 1526, on the plain of Panipat, not far from Delhi, encountered and fought a decisive battle with his enemy, whose army was far superior in numbers. The 100,000 men and 1000 elephants of Sultan Ibrahim were dispersed; Ibrahim himself fled; and Baber made his entry into Delhi. In the following month, Agra, the second city of the empire, surrendered. Baber's enjoyment of empire in India was brief; he died in 1530, having had to contend during the five years of his reign with numerous conspiracies and revolts. To the talents of a general and statesman, which he manifested alike in his conquests, his improvements of public roads, measuring of lands, adjustment of taxation, and his postal arrangements, Baber united a taste for science and art. He wrote in the Tartar language the history of his own life and conquests, which was translated into Persian by Abdul Rachim, and from the Persian into English by Leyden and Erskine (1826). Baber was succeeded on the throne of Delhi by the eldest of his four sons, Humayun, and was the founder of the Baber or Great Mogul dynasty. See **MOGUL**.

Babeuf, FRANÇOIS NOEL, a communist of the time of the French Revolution, was born in 1762 or 1764 at St Quentin, in the department of Aisne, France. He was land-surveyor at Roye in Picardy, and on the breaking out of the Revolution in 1789 he became an adherent of the most extreme revolutionary party. We hear of him for the first time in 1790, when he receives honourable mention from Marat in his paper, *The Friend of the People*. As one of the extreme left, he opposed Robespierre during the Reign of Terror. In 1793 Babeuf had started a newspaper, to which in 1794 he gave the name of *Tribune of the People*; and he began to sign himself 'Gracchus Babeuf.' In this paper he advocated the most violent measures; particularly a rigorous system of communism, by which private property should be abolished, and the fruits of the common industry placed in a common magazine, from which they should be distributed with the most scrupulous equality. A secret conspiracy was formed, the aim of which was the destruction of the Directory and the establishment of an extreme democratic and communistic system. The plot was discovered, and Babeuf and other chiefs were brought to trial. Babeuf was condemned to death, and guillotined in 1797. He was an enthusiast, without talent or culture, but has a certain importance as a forerunner of the social revolutionary movement.

Babi, the name of a modern Persian sect, derived from the title, *Bab-ed-Din* ('gate of the faith'), assumed by its founder, Mirza Ali Mohammed, a native of Shiraz, who in 1843, after a pilgrimage to Mecca, undertook to form a new religion from a mixture of Mohammedan, Christian, Jewish, and Parsee elements. His con-

troversies with the *mollahs* shortly led to his confinement to his own house, where he formulated his doctrines, privately instructed his disciples, and increased his pretensions. He now laid aside the title of Báb, assuming that of *Nokteh* ('point'), and claimed to be the focus to which all preceding dispensations converged. He sent out missionaries in various directions, the most famous of whom was a woman, Gurred-ul-Ain ('consolation of the eyes'), remarkable for beauty and intelligence, who preached against polygamy. The sect soon became numerous, and were not molested by the reigning shah; but on the accession of Nasir-ed-Din in 1848, apprehending persecution, they took up arms, proclaiming the advent of the Báb as universal sovereign. Several Persian armies were routed, but finally the insurgents were reduced by famine, and most of them executed (1849-50). The Báb had held aloof from the revolt, but he was arrested and put to death, after a long imprisonment, in 1850. His successor was recognised in the youthful son of the governor of Teheran, who retired to Bagdad, where he afterwards lived quietly. An attempt of three believers to assassinate the shah in 1852 led to a terrible persecution of the sect; numbers were tortured and burned, among them Gurred-ul-Ain. Bábism has nevertheless gained in strength, and is at present widely diffused in Persia; its members live in apparent conformity to orthodox Mohammedanism, but privately holding the Báb's doctrines, which are contained in an Arabic treatise, *Biyan* ('the exposition'), written by the founder himself. They form essentially a system of Pantheism, with Gnostic and Buddhistic additions. All beings are emanations from the Deity, by whom they will ultimately be reabsorbed. Bábism enjoins few prayers, and those only on fixed occasions; encourages hospitality and charity; prohibits polygamy, concubinage, and divorce; discourages asceticism and mendicancy; and directs women to discard the veil, and share as equals in the intercourse of social life. See **SUFISM**, of which it is a healthier and more practical outcome. See also Gobineau's *Religions dans l'Asie Centrale* (Paris, 1865).

Babington, ANTONY, was born of an old Catholic family at Dethick, Derbyshire, in 1561. Young, handsome, rich, left an orphan at ten years of age, he had served for a short time as page to Queen Mary of Scotland, then a prisoner at Sheffield, when in 1586, some seven years after his marriage, he was induced by Ballard and other Catholic emissaries to put himself at the head of a conspiracy that had for its object Elizabeth's murder and Mary's release. Babington reserved the deliverance of Mary for his own share, entered into correspondence with her, and received from her letters approving of the assassination. The plot was betrayed, and after hiding in the depths of St John's Wood and at Harrow, he was taken, and with thirteen others condemned to die. His prayers for mercy, his explanation of the cipher letters, were all in vain, and on 20th September 1586, he followed Ballard to the scaffold.

Babiroussa (*Sus babirusa*), a species of hog, according to some a distinct genus, inhabiting marshy forests in Celebes and some of the smaller islands of the Eastern Archipelago. The canine teeth in the male are very large, the upper ones being curved towards the top of the head, and so like horns at first sight that the animal is often called the horned or deer hog. It is a nimbler animal than the common hog, and has much more slender legs. It swims well and frequently, is fond of eating maize, and is often killed for the sake of its flesh. It is of interest, however, mainly on

account of the extraordinary development of the canines in the male. The teeth, like those of rodents (see **TEETH**), grow from persistent pulps,

Fig. 1.—Babiroussa (*Sus babiroussa*).

and thus admit of that extension which doubtless occurred at first as an abnormal variation, but has now become a constant character in the males. In the wild boar (fig. 2), wart-hog, &c., the upper canines, even in the female in some instances, tend similarly to curve upwards. This variation, rendered possible by the persistent pulp, and by a slight mobility of the teeth in their sockets, seems largely due to some slight displacement preventing the upper

Fig. 2.—Tooth of Wild Boar.

and lower canines from meeting and limiting one another as they ought normally to do. The frequent habit of rubbing the snout and teeth against hard objects would readily account for an initial displacement. What occurs to a slight extent and occasionally in certain hogs, as the result of slight divergence, bringing about failure of apposition, and thus permitting overgrowth, is present in the male babiroussa as a constant and exaggerated feature. The peculiarity is either transmitted by inheritance, or reappears in every male in response to the constant re-occurrence of the same conditions. In specimens kept in captivity, the variation has been known to become even more exaggerated. Mr Sutton discusses this interesting development in his *General Pathology* (1886), and notes a case from the Zoological Gardens in London where the upper canines of a babiroussa, which was fond of

Fig. 3.—Skull of Babiroussa (from Sutton).

rubbing its tusks, exhibited a very marked circular development, and would have penetrated the skull had they not been repeatedly cut (fig. 3). Though it is unreasonable to expect to find a use for

every variation, it cannot be doubted that these exaggerated canines are of use to the males in fighting for the females, and are to some extent at least an outcome of the general characteristics of the sex. See **SEX**.

Baboo (Bengali and Hindustani *Babu*), properly a term of respect, like Master or Mr, in this sense now used only in Lower Bengal. Anglo-Indians often understand it as meaning a superficially cultivated Bengali; and it often means neither more nor less than 'a native clerk who writes English.' English so written, more copious than correct, and delighting in long and learned words often most ingeniously misapplied, is known as Baboo-English. See Sir Henry Yule's *Hobson Jobson* (1886). See **BABA**.

Baboon, or **CYNOCEPHALUS** (i.e. 'dog-headed'), a genus of Old-World monkeys (*Catarrhini*), with numerous species such as mandrill, drill, sphinx, chacma, and hamadryas. They are at home in Africa, but spread into adjacent parts of Asia. Their most striking characters are—the plump form, the prominent snout, the large canine teeth, the capacious cheek-pouches, the ugly callous cushions on which they sit, and the frequent shortness of tail.

Animals so abundant, ferocious, and repulsively ugly as the baboons, could not escape the observation of the ancients. Aristotle was impressed by the pig-like muzzle of the mandrill, to which he gave the expressive name of *Cheropithecus*, or hog-ape, and even the comparative indifference of the next eighteen centuries to zoological facts was repeatedly interrupted by the hideous vision of some baboon. But long before Aristotle, the baboon had been an object of veneration in Egypt, and was especially sacred to, and typical of Thoth, the lord of letters. Egyptian monuments are thus frequently adorned with statues and figures of baboons, and their mummies are still occasionally found. They held a less honourable place in the middle ages as curious pets in any completely equipped fashionable establishment. Nor is it so long since the mandrill, Jerry of the Surrey Gardens, used to be brought to amuse George IV. Their interest for us now is on the one hand theoretical, and concerns such facts as the numerous characters in which these animals show affinity to the carnivores, and on the other hand practical, so far as these mischievous and voracious animals commit devastations on plantations and other property in the regions which they frequent.

Distribution.—Fossil remains seem to show that the baboons had once a much wider distribution than the now living species. They have, however, kept their footing well, being widely distributed throughout Africa. The drill and mandrill frequent the west coast (Guinea); the baboon proper inhabits wilder and more inland regions from Abyssinia and Kordofan inwards; the chacma and sphinx have rocky homes in the south and west respectively; the hamadryas has its seat among the coast mountains of Abyssinia, South Nubia, and Western Arabia; the geladas occur in the highlands of Abyssinia; and the black baboon is found in the island of Celebes.

Structure.—The dog-shaped head, with its long muzzle and almost constantly terminal nostrils; the capacious cheek-pouches, in which a superfluity of food can be temporarily stowed away, and the frequently large and brightly coloured callous cushions on their hips, are the most prominent external characters. Some of the more internal anatomical characters are no less striking. For while the double curve of the back, and some of the relations of the sacral bone which unites the haunches, and other characters, suggest features

perfected for instance in man, the baboons exhibit greater affinity with the carnivora. This is especially marked in the mandrill, where the backbone, the sacrum, the hip-bones, the paw, and other structures, exhibit a suggestive resemblance to those of the carnivores.

Habit.—The baboons are quadrupeds, running swiftly on all fours, climbing with great vigour, fond of sitting on their haunch-pads, and especially at home in mountainous districts. Many of them live in herds, and are therefore formidable both to animals and property. The troops are led by patriarchs, and guarded by sentinels. They fight with rival herds, and have to withstand the attacks of leopards and other carnivores. Playful and amiable when young, the older forms, and especially the males, are notorious for their evil dispositions, and allow their passions to run riot. The *facile princeps* in iniquity is the mandrill. Those brought home to zoological gardens become specially malicious, the result in part of their sensitiveness to cold, and of the irritations of visitors. They are all clever, dexterous animals, with well-developed brains. Their food varies greatly—fruits, roots, seeds, insects, worms, and many other commodities. The anubis baboon lives principally on the stem and roots of the unique welwitschia, so remarkable for its persistent cotyledons, which act as substitutes for the undeveloped foliage leaves.

Different Species.—About a dozen different forms are known. The Baboon proper (*Cynocephalus babuin*) is hardly known except in captivity. It is a large animal, with a yellowish-brown hide, long depressed skull, and uncoloured cheeks. It is equally strong and clever, and is often utilised by Arabian and Egyptian conjurers. A near relative is the Sphinx (*C. sphinx*), with only a stump of a tail. The Pig-tailed Baboon (*C. porcarius*) occurs in troops in South Africa. Its fur and medium-sized tail are almost black; the muzzle is very long; the colour of the naked parts of the skin is violet-blue; the ridges above the eyes are very prominent, and the eye sockets are curiously separated by an upright ridge of bone; the upper canine teeth are extraordinarily long. The Sacred Baboon (*C. hamadryas*), frequenting the Abyssinian highlands,

Sacred Baboon (*Cynocephalus hamadryas*).

stands about 4 feet high, is of a light-gray and dusky-brown colour, with a naked flesh-coloured face, and a much-compressed ugly skull. Formerly sacred to Thoth, and typical of learning, the hamadryads have sunk in modern Egypt to a subordinate position as luxurious curiosities. They are sometimes caught by being intoxicated with liquor purposely exposed near their haunts, fondness for

stimulants being one of their often observed vices. Their bold plundering habits not infrequently lead them into collision with natives and travellers. The Anubis Baboon (*C. anubis*) is common in Angola on the west coast of Africa, where it lives in the dry gullies. A closely related or identical form inhabits the safe tops of rocks farther inland, and does much damage by descending for midnight ravages among the Indian corn plantations. The Gelada Baboon (*C. gelada*), which is somewhat aberrant, owing to the non-terminal position of the nostrils, frequents the hills of Abyssinia up to an elevation of 10,000 to 13,000 feet. For this form a special genus (*Theropithecus*) has been unnecessarily established. The Mandrill (*C. Mormon*), with its short tail-stump, its enormous, brightly coloured cheek swellings, its brushed

The Mandrill (*Cynocephalus Mormon*).

crown of hair, pig-like snout, 'beetled' brows, sunken eyes, immense canines, and decorated posteriors, is well known as the ugliest and most brutal of the monkeys. Its ugliness is in part, however, a secondary sexual character, the colours, &c. being more marked in the males, and apparently attractive to the less brightly coloured females. It has been already noted how carnivore-like many of its structures are. The mandrill, 'Happy Jerry,' of the Surrey Zoological Gardens, was the subject of many observations as to the habits and disposition of these repulsive forms. The Drill (*C. leucophaeus*) is a smaller form, with less striking colouring and ugliness; it frequents rocks and plains on the Guinea coast. The Black Baboon (*C. niger*) is found far from Africa in the island of Celebes, and has been introduced into other islands. It stands about 2 feet high, has long black fur, an upright curl on the crown of its head, and a rudimentary tail. It frequents woods, and its separation from the other species points to some earlier connection of the continents. An able and graphic account of baboons is given by Professor Martin Duncan in Cassell's *Natural History*, vol. i. See MONKEYS.

Babrius, a Greek fabulist, who lived most probably shortly before the age of Augustus, but of whom nothing whatever is known, his very date being put variously from the Alexandrian age to the middle of the third century of our era. He made a considerable collection of Æsopic fables (see ÆSOP), which he turned into choliambic verse, in a natural and popular style. Several prose versions and transformations of these were made during the middle ages, and have come down to us under the name of *Æsop's Fables*. Bentley was the first to recognise in these so-called prose fables of Æsop

traces of versification showing the original work of Babrius. A few fables were added from manuscripts by Furia, Korais, and Schneider, and all that was known at the time was collected by Knoche (Halle, 1835). At last, in 1842, a Greek of the name of Minoides Minas, employed by the French government to explore the convents of the East, discovered at Mount Athos a manuscript with 123 hitherto unknown fables of Babrius, a copy of which he made and brought to Paris, where they were published in 1844. In 1857 he found 95 fables more, the authenticity of which, however, was denied by Conington, Cobet, and other scholars. These were edited by Lewis in 1859, were included by Bergk in his *Anthologia Lyrica* (4th ed. 1883), and were edited, with additions from manuscripts in the Bodleian and Vatican libraries, by Giltbauer (Vienna, 1882). See Lachmann's edition (Berl. 1845), and Rutherford's *Babrius* (1883).

Baby. For the feeding of infants, baby-farming, &c., see INFANT.

Babylon was the name of a fortress in Lower Egypt, on the right bank of the Nile, opposite the pyramids of Ghizeh. Its origin was ascribed to Babylonian deserters, but it first became an important place under the Romans.

Babylonia (*Babilu* in the Assyrian inscriptions, *Babirush* in the Persian) was the name given to the low alluvial plain watered by the lower streams of the Tigris and Euphrates, now forming the modern Arab province of Irak-Arabi. In the Old Testament it bears the various names of Shinar, Babel, and 'the land of the Chaldees.' It is difficult to state the true boundaries of this rich and fertile land, for during the various periods of Babylonian and Assyrian supremacy they varied considerably. The northern boundary, from the region of Naharaim or Mesopotamia, was formed partly by the Euphrates and its tributaries, but chiefly by a line of forts and frontier stations established by mutual arrangement between the Assyrian and Babylonian kings at various periods, this being probably the Median Wall of the classical writers. On the east the Tigris formed the natural boundary, but some portions east of that river and south of the Lower Zab at times were included in the Chaldean empire. These were the provinces of Namri or Kurdistan. The western boundary was the Euphrates, or rather the desert to the east of that stream, for from the earliest period the fertile fringe of land along the river's bank in the neighbourhood of Ur (Mugheir) and Borsippa (Birs Nimrud) was under Babylonian rule. The southern limit was the shores of the Persian Gulf, the waters of which then extended considerably farther inland, the two rivers as late as the time of Sennacherib, 705 B.C., entering the sea by separate mouths. The country has from all time been one of the most fertile spots in the whole of Western Asia, and famed for its rich corn-producing qualities. Indeed Herodotus says that it supplied one-third of the corn produced by the whole Persian empire. The inscriptions afford ample confirmation of this fact, the tithe receipts of the temples showing an enormous yield of cereals. This natural fertility was greatly aided by the splendid system of artificial irrigation by a network of canals spread all over the country, many of which are navigable to the present day. The most important of these was the Nar Malka, which was serviceable as late as the 7th century A.D., and only disused when allowed to fall into decay after the Mohammedan conquest. This important artery joined the Tigris and Euphrates in North Babylonia, passing through the ancient cities of Sippara or Sepharvaim and Akkad, and entering the Tigris about 30 miles below Bagdad.

The lines of its course are marked by the modern Yusifieh and Amram canals. This canal was probably excavated by Khammuragas in the 22d century B.C. Other important inland waterways were the Nar Kuti or river of Kutha, the modern Hables-Sook, which passed through almost the whole length of Central Babylonia—and the Nar Essu or new river, a large canal in the neighbourhood of Babylon excavated by order of Nebuchadnezzar II. (605 B.C.). According to the ancient records, Babylonia was divided into several provinces, the number and extent varying considerably at different periods in the history of the empire. The chief division appears to have been first into two large provinces of Sumir or Shinar (South Babylonia), the region from the Persian Gulf to Babylon, probably at one time, as some critics think, the name of all the lower valley of Mesopotamia, and Akkad or North Babylonia, extending from the boundary of Sumir to the Assyrian and Mesopotamian frontier. The capital of this latter province was, like Babylon, built on both banks of the Euphrates, the larger half being called Sippara of Samas, the sun-god (the modern *Abu Habba*), and the smaller half Akkad or Agade. The latter was afterwards named 'Sippara of the moon-goddess,' whence the scriptural name Sepharvaim, 'the two Sipparas.' Other minor provinces embraced within these two were Gan-Duniyas (the northern part of the Akkad) and the south part of Akkad, Edina or Eden, called also Zeru or Dura, the plain in the immediate vicinity of Babylon; Gambulu, the marsh region, now the modern Afadj; and Mat Kaldu, the land of the Chaldeans, the region bordering on the Persian Gulf and the east bank of the Euphrates.

The natural products of this fertile land were almost unbounded—corn and many other cereals, and also grapes, fruits of several kinds, samsame, vegetables of several kinds, cucumbers, melons, onions, garlic. Stone being extremely rare, having to be obtained from Upper Mesopotamia or the mountains of Elam, the only building material was clay, an ample supply of which was obtainable.

Ethnology.—Babylonia, according to both sacred and classical writers, has always been a land of mixed races and tongues, and the polyglot and heterogeneous character shown by the monuments to have existed in a very remote antiquity. The earliest of the inscriptions has revealed to us the important fact that the first population was a people belonging to the Ugro-Finnic branch of the Turanian family. The linguistic connection has been confirmed by the recent discovery by M. De Sarzec of statues of these primitive inhabitants which present an undoubted Tartar type of features. The skull is dolico-cephalic, with high cheek-bones, curly black hair, the eyes oblique and bright; the type being ethnically related to the Elamites of Susiana and the Turanian Proto-Medes, to whom we find this early race linguistically related. These people, the Sumero-Akkadians, were not aboriginal to the plains of Chaldea, but came, as their traditions indicate, from the mountains to the north-east—whence the name of one branch of the family, the Akkadai or 'mountaineers'—and brought with them the already fairly advanced elements of civilisation which they planted in Chaldea. At a very early period in the history of Babylonia the Semites appear as an element in the population, their type being clearly indicated in the sculptures connecting them with the Hebrew and Northern Arabs, while the same relationship is linguistically established. From time to time, by war or commerce, other elements were introduced into the population, until almost every nation finds its representative in the 'mixed crowd of nations' inhabiting the plains of Chaldea.

The Semites having once obtained a footing in Babylonia, soon assimilated themselves to the more advanced culture of their Sumero-Akkadian masters. They borrowed the cuneiform mode of writing, the religion, mythology, and much of the science of that inventive people, and so rapidly increased in numbers and power, that as early as about 3800 B.C. we find a dynasty of Semitic kings under Sargon of Akkad and his son Naram-Sin, ruling in North Babylonia.

Chronology.—Hitherto students of Babylonia have been almost entirely dependent upon the fragmentary portions of the Canon of Kings drawn up by the Greco-Chaldean priest Berosus about 268 B.C.; but these lists are now confirmed and superseded by Babylonian Canon inscriptions dating from the 6th century before our era. The documents are (1) a Canon of Kings by their dynasties, extending from 2200 B.C. until 647 B.C., partly mutilated, but capable of restoration; (2) Tablet of Synchronous History of Assyria and Babylonia, which gives the names of the Babylonian kings from about 1800 B.C. to 732 B.C.; (3) a Chronicle Tablet giving the chief events in Babylonia, the month and day being given in most cases, from 747 B.C. to 660 B.C.; (4) A collection of dated contract tablets extending from 680 B.C. to 150 B.C. This unequalled series of chronological documents gives an almost complete sequence to Babylonian history, and although there are still *lacunæ*, the basis is now much more sure than when we were dependent solely upon the second-hand statements of Ctesias and Berosus.

Domestic and Social Life.—The few notices in the works of Herodotus and Ctesias and other ancient writers, afford us but a very scanty notion of the highly developed character of the social life of ancient Babylon. The recovery from the libraries and treasuries of the oldest cities of the empire of many thousands of inscribed tablets relating to almost every phase of private daily life, afford us an insight into the sociology of this ancient empire, far more clear than that provided by the records of any other primitive kingdom, excepting perhaps the sister-kingdom of Egypt. The child, immediately after birth, was sealed with the sign of sonship, which was confirmed by witnesses; circumcision followed at the period of eight or ten days. On reaching the age of puberty, the youth was admitted to his portion as a free-born citizen, and his freedom attested to him. The Babylonian legal tablets relating to the laws of marriage certainly do not confirm the statements of Herodotus. The dowry of the woman was secured to her, and was returnable in case of divorce, while marriage was attended by both a religious and civil ceremony. Women, especially married women, occupied an exceptionally favourable position in Babylonia. Offences against the mother were punishable by mutilation and deprivation of civic rights. Women could trade and own slaves and other property in their own right. All free Chaldeans had to be educated and taught tablet-writing. Slaves were protected from cruel treatment, and if injured, had to be supported by their masters. They could own land, and, if able, maintain themselves. Slaves were often apprenticed to learn trades by their masters.

The laws were administered by regular appointed judges, who sat either in the gates of the temple or in the great gate of the city. The supreme judges were called 'the judges of the king.' The decisions were all governed by certain precedents, many of great antiquity, which were drawn up and carefully preserved. The chief punishments were fines, imprisonment, deprivation of civic rights, and in some cases death. The right of appeal to the king could be claimed. The revenues were derived from

a fixed tariff of taxes. The chief taxes were the 'king's tax,' apparently a tithe on all property, the army tax, and the dues levied on certain districts for ships. The local taxes were the temple tithes, called *tenth*s (*esritum*), the first-fruit tax, the corn and date and sheep tax, and the road and canal dues. Numerous documents relating to these dues are now in the British Museum collection. The temples had rich estates attached to them, like the modern Arab Wakif lands, and farmed them or leased them at will. The transfer of land was regulated by fixed laws, and leases had in many cases carefully drawn plans of the estates attached to them. The standard currency was a silver one, the units being the talent, maneh, shekel, and paras. Coined money was introduced in the reign of Darius. The first coins, stamped with the figure of a bird, were perhaps the *tetradrachma* of Athens.

Art and Manufactures.—Babylonian art was until recently represented by a few engraved cylinders and gems; but the recent explorations on the Shat-el-Hie, the site of the ancient city of Sergal or Kulunu, conducted by Mr Rassam at Sippara (*Abu Habba*), and by M. De Sarzec at Tel-lo, have discovered statues which are really good works of

Fig. 1.—Chaldean Cylinder, Marble or Porphyry (New York Museum).

art, differing from all previous examples of Babylonian art, and from the later works of the Assyrian artists. The largest of these statues is nearly life-size, and represents the 'high-priest' Gudea, the viceroy of the city, seated on his throne; the statue is extremely accurate in its anatomy, and carved in the hardest green diorite. The whole of the group is covered with a long inscription in archaic characters, recording the restoration of the temple by this prince in (about) 2700 B.C. Still more remarkable is a fine head carved in red porphyry, which clearly bears the appearance of being a portrait, and is true to the facial characteristics of the Sumero-Akkadian race. These statues bear a close resemblance to the remarkable statues of the early Egyptian king Kephren. The execution of these works of art indicates that the art of sculpture had been long practised, and that tools of the most perfect temper must have been used. Along with these were found several bronze statuettes, showing a knowledge of the art of casting metals. Gem-engraving has always been a special feature of Babylonian art, and numerous hard stone seals have been found, the intaglio workmanship of which shows a high development of the lapidary's art. The subjects upon these are chiefly taken from the legends of Gizdhubar, or from the popular myths, while others relate to the future life. Talismanic gems bearing emblems of the gods and magical formulae are also frequently found. The stones chiefly selected by the Babylonian lapidaries are hematite, green and red jasper, cornelian, chalcedony, crystal, lapis-lazuli, onyx, and sardonyx. Music formed an important feature both in the court and religious ceremonies of the Babylonians at a very early

period, and on the sculptures we find the harp, pipe, and cymbals represented. Among the trades mentioned in the tablets we find the weaver, dyer, potter, smith, builder, and carpenter.

History.—The discoveries of the last few years have given to the history of the ancient Babylonian empire a most surprising retrospective enlargement. It is now evident, from the monuments and inscriptions which have been obtained from the traditionally oldest cities of Chaldea, that the civilisation of the ancient people of Babylonia has an antiquity rivalling that of ancient Egypt. The earliest monument of which we can accurately fix the date is a stone whorl in the British Museum, brought from Sepharvaim by Mr Rassam. It is an oval-shaped stone, inscribed in what is called *line* writing—that is, writing in which the characters are formed more by lines than by the ordinary wedges, a style that goes back to a time when the hieroglyphic or pictorial system of writing was beginning to be discontinued. The king's name inscribed

Fig. 2.—Inscription upon the Sargon Stone.

(From a Drawing by Mr Rylands.)

is that of Sargon I., king of Akkad, who is now universally assigned to the remote antiquity of 3800 B.C., and other inscriptions of this remote period are to be found in other European museums. Older still, in all probability, are the very archaic records found by M. De Sarzec at Tel-lo, in the neighbourhood of Erech, which, written in the ancient agglutinative dialect of the Sumero-Akkadian inhabitants, must precede the Semitic inscriptions of the northern kingdom of Sargon and his successors. These early inscriptions are mostly of a very short character, containing little more than the names and titles of the kings who ruled the cities, but at the same time they afford us information as to the state of civilisation existing in Chaldea nearly 4000 years before the Christian era. The empire had not become one consolidated whole, and polyarchy was the most prevalent form of government, each city being ruled by its local king. Thus, Sargon was king of Akkad, and especially styles himself king of 'the city.' Ur-bahu and Dungi were rulers of Ur, and others held sway in the cities of Eridhu, Larsa, and Babylon. Some of these early rulers claim the titles of king of Sumir (Shinar) and Akkad, a division which in after-time had the geographical signification of N. and S. Babylonia, but which in the earlier ages are certainly rather to be regarded as ethnic than local divisions of this early population. Babylon, though always one of the most important cities of the empire, was not the earliest capital, for the cradle of Chaldean civilisation was in the region of the south. Here all the ancient legends connected with Gizdhubar as Nimrod are located, and find their centre in the city of Uru-ki, the Erech of Genesis, the name of which means 'the city of the land,' or capital. The next most important city in this southern region was Ur, the sacred city of the Moon-god, the ruins of which are marked by the mound of Mugheir, on the west bank of the Euphrates, the city from which Abram came. Larsa (Senkerah), the Ellasar of Gen. xiv., Sergul or Kulunu, the Calneh of Genesis, now marked by the ruins of Tel-lo on the Shat-el-Hie, and Eridhu, the most sacred city of South Babylonia, called frequently the 'Holy City,' were all seats of local rulers. The first ruler who succeeded in combining those various city kingdoms into one consolidated

whole was Ur-bahu, whose reign must be placed about 2700 B.C. This ruler restored temples in nearly all the above-mentioned cities, and appointed 'priest viceroys' to rule in them. He was succeeded by his son Dungi, who has left us a large number of inscriptions. Already Chaldean civilisation had made great progress and was far advanced, and the sciences, especially mathematics and astronomy, were studied; while the ships of Chaldea navigated the Persian Gulf. The first really historical chronicle belongs to this period, and is found on a statue of Gudea, which shows the Babylonians already at war with Elam and the nations to the west. The wars with Elam form the chief features of the history of this period. In 2280 B.C. a powerful confederation of Elamites under Kudur-nakhundi invaded South Chaldea, and sacked the capital, Erech, carrying away the statue of the divine patroness Nana or Istar. This dynasty lasted until about 2120 B.C., and was very powerful, as shown by the numerous inscriptions of the kings found in various parts of Babylon. Of the kings of this period two are specially important—viz., Kudur-mabug, who appears to have been lord-paramount of the confederation of kings, and who claimed the title of 'lord of the west,' or Syria, and his son, Eri-aku, who was ruler of Larsa. This latter ruler is almost universally identified by Assyriologists with the Arioch, king of Ellasar, mentioned in Gen. xiv. This dynasty was overthrown by the powerful usurper, King Khammuragas, who appears not to have been of native Babylonian origin, but rather a Kassite or Cossican who had settled in the land and availed himself of this period of depression to seize the throne. This Kassite dynasty is one of the most important periods in Babylonian history, as great political changes took place at this time. It was at this period that Babylon began to assume its position as the capital of the whole empire. Khammuragas rebuilt the temples of Bel at Babylon, Nebo in Borsippa, and restored several of the sacred edifices in South Babylonia, at Ur, Erech, and Larsa, which had suffered at the hands of the Elamite invaders. His greatest public work, however, was the construction of a canal called the river of Khammuragas, 'joy of men,' which there is little doubt was the Nar Malka or royal river of the classics. This canal crossed North Babylonia, passing through Sippara, and is now represented by the Yusifeh canal, one of the few ancient canals navigable to the present day. This dynasty lasted about 180 years, the founder himself ruling 45. The very numerous collection of inscriptions of this period in the British Museum

Fig. 3.—King Merodach-idin-akhi. (From a Basalt Stele in the British Museum, about the 12th century B.C.)

shows that at this time Babylonia was occupied by a much mixed population, consisting of Sumero-Akkadians, Elamites, Kassites, and a large Semitic element. The Semites appear principally as traders and merchants.

The three succeeding dynasties, extending over a period of about six hundred years, consisted of a mixture of Semitic and non-Semitic princes, who ruled with Babylon as capital. The history of this period is chiefly to be derived from the Tablet of Synchronous History and only a few Babylonian records of the period have been preserved. One of the most important Babylonian inscriptions of this period is the memorial stone of Nebuchadnezzar I., 1150 B.C., a usurper who seized the throne, and waged war against the rising empire of Assyria. In this inscription the king records the result of a campaign against the Elamite chiefs in the region of Namri or Kurdistan and on the banks of the Ulai River, on which the city of Sushan was afterwards built. The description of the campaign undertaken in the hot summer months is extremely graphic for so ancient a document. 'In the month Tammuz he took the road, the rocks were burning and scorched like fire, from the gardens was burned all vegetation, there was no water in the springs, and cut off were the drinking-places, the strength of the great horses wearied, and to the warlike hero his courage returned.' The writer thus describes the battle in which the Babylonians were undoubtedly worsted, and only saved from complete defeat by the aid of the governor of an adjacent city who refused to surrender to the Elamites. In return for this the city has a charter of freedom granted it, declaring it free from taxes and from the usual levy for men in the time of war. The history is after this date chiefly to be derived from Assyrian sources, and it is not until the time of Nabunazir, the Nabonassar of the Canon of Ptolemy, that we have any complete sequence of Babylonian history. Our information is now chiefly derived from the important but unfortunately fragmentary Chronicle tablet already spoken of. Nabonassar, whose reign forms an important epoch in Babylonian history, ascended the throne in 747 B.C., and ruled for fourteen years. During his reign, the country was twice invaded by the Assyrians, and though they claim the victory, they do not seem to have shaken the king on his throne. Nadinu, the Nadinios of Ptolemy, who succeeded to his father's throne in 734 B.C., only ruled for two years, when one of the popular revolts unseated him and placed Ukinziru, the Chimzoros of Ptolemy, on the throne. In the third year the country was invaded by the armies of Tiglath-pileser III., king of Assyria, who drove the Babylonian king from his capital into the marshes of South Babylonia, where he found him and put him to death, ascending his throne under the Babylonian name of Pulu or Pul. This conquest of Babylonia in 729 B.C. was a very important event in the history of the kingdom, for it brought the two courts of the north and south kingdoms once more into close relationship. The death of Sennacherib IV., king of Assyria, and the usurpation of the throne by Sargon the Tartan in 722 B.C., was the opportunity seized by the Babylonians for once more becoming independent under the leadership of a prince of very ancient descent—Merodach-baladan II. This prince was one of the most popular rulers of the middle Babylonian kingdom, and was supported by all classes of the people as well as by the Elamite court, who were the most powerful opponents of Assyria. For twelve years the wars in Syria and other parts of the empire kept the Assyrians from despatching sufficiently strong forces to the south to crush this powerful prince. In 712 B.C. Sargon was purposing to march

into Babylonia, when a counter-action was caused by the Babylonian prince sending an embassy to Hezekiah and the other princes of Syria, and raising a revolt which called the invaders away (2 Kings, xx. 6); but in 710 B.C. the storm broke, and Sargon captured Babylon, proclaiming himself king. On the assassination of Sargon in 705 B.C. Merodach-baladan returned, and after a reign of some nine months was driven from the land by Sennacherib, seeking refuge in the Elamite provinces on the east shore of the Persian Gulf. For some years Babylonia was now ruled by viceroys and princes appointed by the kings of Assyria, although several native princes attempted revolt. In 688 B.C. Sennacherib, after a very severe campaign, in which he defeated the allied Elamites or Babylonians, became sovereign of the two kingdoms. His son and successor, Esar-haddon, attempted to carry out a policy of a more conciliatory kind, and divided his time between the two courts; but the violent opposition of Egypt in Syria weakened his power, and the Elamites and Babylonians constantly harassed. Shortly before his death he appointed his son Sennasirum-yukin, the Sennasirinos of Ptolemy, ruler, which appointment was confirmed by his son and successor Assur-bani-pal. This prince, tempted by the intrigue of the Babylonian priests, revolted against his brother, and was defeated after a terrible war, in which Babylon, Sippara, and Borsippa were besieged, and burned himself in his palace, 647 B.C. Kandalanu, who succeeded him, was little more than a viceroy, depending in every way upon the Ninevite court, although tablets are dated in his reign. On the disruption of the Assyrian empire after the death of Assur-bani-pal, the throne of Babylon was seized by Nabu-ahla-utzar, or Nabopolassar, the general of the Babylonian garrison, who had married a Median princess, and was himself no doubt of collateral descent from the royal line of Babylonian kings. The general disruption of the states of Western Asia which took place in 625 B.C., subsequent upon the inroad of a large mass of Aryan and other invaders from the East, afforded the Babylonians an opportunity for throwing off the hated yoke of Assyria, and Nabopolassar was proclaimed king in 625 B.C. He was succeeded in 604 B.C. by his son Nebuchadnezzar, one of the greatest sovereigns who ever ruled over the ancient empire. During a long reign of forty-three years the prince succeeded in recovering the long-lost provinces of the kingdom, and once more making Babylon queen of nations. He not only restored the empire and rebuilt Babylon, but almost every temple and edifice throughout the land underwent restoration at his hands. It is an astonishing fact that not a single mound throughout Babylonia has as yet been opened by the explorers which has not been found to contain bricks, cylinders, or tablets inscribed with his name. In 599 B.C. he captured Jerusalem, and sent Jehoiakim captive to Babylon, and eleven years later, owing to the still disturbed state of the kingdom (588 B.C.), he destroyed the city, and removed most of the inhabitants to Chaldaea. Nebuchadnezzar was succeeded in 561 B.C. by his son Evil-merodach, who released Jehoiakim, but was murdered by his brother-in-law, Nergal-Sharezer, who was the *rab maku* or 'chief seer' of one of the temples. His reign lasted until 556 B.C., his son Labasi-Kudar, the Laborasorachad of Ptolemy, only ruling a few months. The throne was in 556 B.C. usurped by a powerful and active prince, Nabu-naid or Nabonidus, the son of a 'chief seer,' whose reign is the most important, next to that of Nebuchadnezzar, in later Babylonian history. The inscriptions of this king are found in almost all temples, and some of them contain

important historical facts. In a cylinder found at Sippara, the king records his restoration of the temple at Kharran, which was destroyed by the Seythians, and in his sixth year, 549 B.C., he records the overthrow of Astyages, king of the Medes, and the capture of Ecbatana by Cyrus. In the king's seventeenth year the whole land of Babylonia was in revolt against him for neglecting the duties of court and religion, leaving all to his son Belshazzar. During the summer of this year Cyrus invaded Babylonia, advancing from the neighbourhood of the modern Bagdad, and reaching Sippara on the 14th day of Tammuz (June), which the garrison yielded without fighting. Two days later, Tammuz 16, Babylon is taken in the same manner. Cyrus appointed Gobryas ruler. Three months later Nabonidus, who was a prisoner, died, and after a week's mourning by the people, was buried on the 4th day of Nisan, 538 B.C. Babylonia now became a Persian province, and under the rule of Cyrus (538-29 B.C.) and Cambyses (529-21), it appears to have been peaceful. On the accession to the throne of Darius, son of Hystaspes, the old rebellious spirit once more asserted itself, and for three years (521-19) the city held out against the Persians under Nadinta-Bel, who claimed to be Nebuchadnezzar, son of Nabonidus. Again, in 513 B.C., the city revolted under Arakha, an Armenian.

With the overthrow of the Persian monarchy, Babylonia came under the short-lived dominion of Alexander the Great, who died in that city (323 B.C.). Seleucus I., to whom it had been promised at the conference of Triparadisi, contested and won the possession of it from Antigonus (312 B.C.). About 140 B.C., it was taken from the Syrian monarchs by the Parthians. It came into the hands of the Romans only temporarily, first under Trajan (114 A.D.), under Septimius Severus (193 A.D.), and again, under Julian (363 A.D.). When in 650 the successors of Mohammed put an end to the new Persian monarchy of the Sassanides, the province of Babylonia, where Bagdad was built (762-766), became the seat of the califs till 1258. Since 1638, when the Turks, for the second time, took it from the Persians, it has been under the dominion of Turkey, divided into the pachalics of Bagdad and Basra.

The classic writers represent the civilisation of the ancient Babylonians as of a high stamp. The government was despotic, of a kind to suit a crowded, luxurious, and effeminate population. Arts and commerce were highly flourishing—the last was carried on by caravans with Bactria, Persia, and Media, perhaps as far as India, and by shipping on the Persian Gulf with Arabia. Babylonia was famous for its dyes, its cloths, and embroideries, especially for the manufacture of rich carpets with invoven figures of strange animals and arabesques, such as we yet see on the Nineveh sculptures. The general prosperity was such, that Babylonia and Assyria together were able to pay to Persia, in the time of Darius Hystaspes, a yearly tribute of 1000 talents (upwards of £280,000)—a sum greater than that contributed by any other province.

Literature.—The Babylonians, that is, the old Sumero-Akkadian population, were essentially a literary people, and the scribe caste comprised many of the highest in the land. It is evident from the numerous inscriptions as early as 2000 B.C., which are the work of private persons, that a certain amount of education was bound to be attained by every Babylonian, and that this implied access to the temple schools and libraries is certain from the directions given in certain tablets, which show the student how to ask for the works he required from the libraries. The tablets were all

numbered and arranged in order according to the various sections to which they belonged, and directions were given to order the works by the numbers attached to them. The literature in the Babylonian libraries was, like the religious development in the earlier stages, largely influenced by local schools of thought, and consequently certain branches of literature represent the teachings of certain temple schools. In the most ancient school of Eridhu, the sacred city of Ea, there was established the chief centre of a school of religio-magic, who devoted themselves almost entirely to the study and composition of works on magic and kindred subjects. In this city the series of tablets known as the books of 'spells relating to diseases of the head,' consisting of more than fifty tablet volumes, was composed. These remarkable works, as M. Lenormant has shown, bear a close resemblance to the Atharvaveda or Black Veda of the Aryans. The epic poem of Gizdhubar, with its twelve books arranged according to the signs of the zodiac (see ASSYRIA), was probably the production of the school of Erech, the most ancient capital of the land, but was traditionally attributed to a scribe named *Sin-iki-unini*. Other poems, such as the Sumero-Akkadian version of the war in heaven, which describes the attack of the seven evil spirits on the moon, may be ascribed in all probability to the city of Ur. One of the most perfect specimens of Babylonian literature is the tablet describing the war in heaven between Merodach and the demon Tiamat, which comes from the library of the temple of Nebo at Borsippa. Of this tablet we have both Assyrian and Babylonian versions. This poem describes in most beautiful words the commission of Merodach by the great gods in assembly for the work of crushing the evil demon. The fight of this terrible nature-war, and the conquest of the evil one and his allied spirits of darkness, is all described, and then the tablet closes with a remarkable hymn of praise to the victor. In fact, the literature contained in these libraries comprised every branch of learning known at the time. Historical and mythological documents, religious compositions, legal, geographical, astronomical, and astrological treatises, magic and the arts of divination, poems, fables, and proverbs. In this last branch one of the most curious specimens is the legend of the bird-god Zu, 'the wise one,' who stole the tablets of destiny and the secrets of the gods, and, like Prometheus, brought them down to earth, he himself being driven away to the mountains for his sin. One important distinction between the literatures of Babylonia and Assyria remains to be noticed: in the former the names of the writers are known in most cases, while in the latter all merit is appropriated by the king. Most of the classic works of Chaldea were copied by the Assyrians under Assur-bani-pal, and placed in the library and at Nineveh, and became part of the literature of the northern empire (see ASSYRIA).

Religion.—During the long period over which the monuments and inscriptions extend, numerous changes took place in the religion of Babylonia. The early speculations of the Sumero-Akkadians were a rude fetich-worship or Shamanism, according to which every object in nature was regarded as the abode of an indwelling spirit or life (*Zi*), which controlled its actions and its relationship to man. Round this primitive creed grew up a body, not of priests, but rather of medicine-men, or exorcists, who dealt only with the malevolent spirits of sickness and disease, and the hostile powers of nature injurious to the life of man.

The liturgy of these priests is found in the hymns and magical texts, large numbers of which have been preserved in the libraries of Nineveh and

Babylon. Gradually the vast host of spirits became grouped in a hierarchy of the spirits of the heavens and the earth; and from these came the first gods of the Sumero-Akkadian pantheon. These two great spirits, so frequently invoked in the sentence, 'Oh Spirit of the heavens, exorcise thou! Oh Spirit of earth, exorcise thou!' became no longer spirits, but *Dingri* or 'creators,' a word explained by the Semitic *Ilu*, 'god,' and the parents of all the other gods. Under this new development a number of local gods grew up, and each city had its divine patron, who was worshipped there with a strict henotheistic worship—that is, he alone in his sacred city was supreme among the gods. Thus, in a beautiful litany from Ur of the Chaldees, this phase of the religious life is clearly shown. 'In heaven who is supreme? Thou alone art supreme! On earth who is supreme? Thou alone art supreme!' Yet the same words appear in the local liturgies to Merodach in Babylon, and to Nebo in Borsippa. One of the earliest seats of religious culture in Chaldea appears to have been the city of Eridhu, then on the shore of the Persian Gulf, where was the seat of Ea, 'the lord of the sea.' This strange divinity, whose worship is most ancient, bears the titles of 'lord of the wave,' 'king of the deep,' 'lord of rivers,' and 'the god of boatmen';

the modern Niffer. This great god, whose name means the 'lord of the ghost-land,' was also the ruler of 'earth and mankind,' and, according to one version of the Deluge legend, was the deity who caused the destruction of the wicked men. The wife of the 'lord of the ghost-land' was the goddess Ninkigat or Allat, 'the lady of the great land' of Hades. She was the queen who ruled in the dread 'land of no return,' and 'whose city and palace walls were clothed in dust, the inhabitants thereof wearing robes of feathers like birds.' The child of this dread pair was Namtar, 'the demon of fever and goddess of fate,' who carried out the behests of his parents in spreading disease and death abroad. One of the most holy of the descendants of Mul-lil was the Moon-god, who soon, however, became a greater even than his father, and in his sacred city of Ur, became the centre of a great religious development spreading to Kharran, and Syria, and Arabia. In the city of Ur, 'the dwelling of the moon-god' was worshipped under the name of Nannar or Nanak, both names being preserved to us in the legends of Hellenic Asia. Some of the hymns to this deity are among the most beautiful in the sacred poetry of Chaldea. 'Merciful one, begotten of the universe, who founds his illustrious seat among living creatures. Long-

Fig. 4.—Upper half of 'Sun-god Tablet'—priests and king adoring the sun's disc (British Museum). (From a Photograph by Praetorius.)

also we find him called 'lord of wisdom,' 'he who knows all things,' 'lord of laws,' all of which titles aid us in identifying him with the mysterious fish-divinity, who taught, according to Berosus, the elements of culture to the first inhabitants of Chaldea. The consort of Ea was Dav-kina, 'the lady of the earth,' who personified the earth just as Ea represented the sea. Water and the earth were, according to the ancient theogony of the city of Eridhu, the two elements out of which all the world proceeded. This pair had a son, Tammuz, 'the only begotten one,' who, according to the creed of Babylon, was replaced by Marduk or Merodach. The worship of Tammuz in association with his sister and consort Istar, reached a high development in Babylonia, and spread over the whole of Western Asia. Next in importance among the local deities came the god Mul-lil, the elder Bel of the Semitic creed, whose sacred city was Nipur,

suffering father, full of forgiveness, whose hand upholds the lives of mankind. Lord, thy divinity is as the wide heavens, and fills the sea with its fear.' 'On the surface of the peopled earth he bids the sanctuary be placed—he proclaims their name. The father, the begotten of gods and men, who causes the shrine to be founded, who establishes the offering, who proclaims dominion, who gives the sceptre, who shall fix destiny unto a far-distant day.' In the creed of the ancient population of Babylonia, the moon took precedence of the sun-god, the latter being the son of the former. This was probably due, as Professor Sayce has suggested, to the fact that Mul-lil was lord of the night-sky.

However, under the influence of the Semites, especially those of the northern cities of Sippara and Akkad, Samas the sun-god soon became the head of a special cult which absorbed many of the other older gods, and each city had its local sun-god or solar hero. The old centre of sun-worship in Chaldea was the city of Larsa, 'the dwelling of the sun-god,' where many of the oldest kings restored the great temple. It was, however, in the northern city of 'Sippara of the sun,' and in the most ancient temple of E Bábara, 'the house of lustre,' where this worship attained to its highest development. The spread of the solar worship in Chaldea received a strong impetus from the patronage of the great Semitic ruler, Sargon I. (3800 B.C.), who restored his temple. The tablet, of which a representation is given (fig. 4), was erected by Nebobaladan, king of Babylon, an ardent votary of the worship of the sun-god, about 900 B.C. The god is seated on a square seat, placed inside a porch supported by pillars, and holds in his hand a ring and a short rod. Before the pillar stands a stool with legs, bearing a figure of the disc of the sun, apparently supported by cords which are held in the hands of two attendant spirits from the roof. Of the three figures standing with their faces turned towards the disc,

the first is a priest who holds the stool with his left hand, while with his right he grasps the left hand of the second figure—the king, whose right hand is raised in adoration to the god. The third figure behind the king has both hands raised in adoration. Above the heads of the three figures are the three lines of inscription, 'the image of the sun-god, the mighty lord, the dweller in the temple of Parra (or Bara), which is within Sippara.' Under the god are carvings of two figures, and above are three circles, representing the new moon, the sun, and Istar or Venus. Exactly under these runs another inscription, and two lines run along the roof. Underneath the whole are six columns of Babylonian writing, consisting of hymns to the sun. The rise and spread of the sun-creed in Babylonia mark a great change in the religious life of Chaldea in the meeting and amalgamation of the Semitic and Akkadian religious thought. We have no longer to deal with the dread Mul-lil of the ghost-land, but with a supreme Baal, the head father and creator of the universe, who rapidly absorbed all the other solar deifications in the old Sumero-Akkadian pantheon. Dumzi, or Tammuz of Eridhu, Ningirzu of Sergul, Silikh-mulu-khi of Eridhu and Babylon, all became absorbed in Bel-Merodach or Marduk of Babylon or Samas of Sippara. It is to this age that we must assign the growth and compilation of the great epic of Gizdhubar, the sun-god, which embodies so many solar legends and solar characters. From this religious reformation there grew up the worship of the great Bel-Merodach, once a solar deity, but gradually as the city became the capital of the empire this local deity became the head of the pantheon, and the national god, as Assur became in Assyria. The position which Merodach attains under the religious school of the later empire is a near approach to monotheism, and he visits all neglect of his worship with severe punishment. It was for neglect of his supreme power as lord of Babylon and Babylonia that Nabonidus was visited with the rod of the Persian, and his power was recognised by the conqueror, for Cyrus calls himself the 'servant of Merodach.' Zirpanit, the consort of Merodach, was but a reflex of her lord and master, and as the goddess of wisdom she retains some traces of the former connection between Merodach and his father Ea. It is to this pair that the invocations of the kings of the later Babylonian empire are directed. The temple of Bel-Merodach or the tomb of Belus was one of the wonders of the world. The temple stood on the east side of Babylon, and was certainly as old as 2150 B.C., when Babylon became the capital of a consolidated empire. It bore the Akkadian name of E Sagilla, 'the house of the raising of the head.' Its beautiful entrance-gate, like Solomon's porch in the temple, was called 'the gate of glory,' and just within which was the sacred seat or couch of Zirpanit, the Succoth-benoth of the Scriptures (2 Kings, xvii. 30). In the temple itself was the *papakha* or shrine of Merodach, 'the holy of holies of the gods of destiny,' which was separated from the *ekal* or main nave or holy place by a veil. In the centre of the court rose the great *Ziggurat*, called 'the house of the foundation of heaven and earth.' The ceremonies of the service in this temple present a remarkable resemblance to the Temple of the Jews. The daily morning and evening sacrifice, the meat and drink offering, the free-will offering, the sin-offering, and the show-bread, all formed part of the ritual of this temple. Next in importance to Merodach was the god Nebo, who, with his consort Tasmit, was worshipped in the city of Borsippa (see ASSYRIA). Here he was associated with his goddess Tasmit, and presided at the temple of E Zida, 'the ever-

lasting house,' the chief university of Chaldea. Several of the minor gods and spirits survived in the new and highly developed cult—Ninep or Uras, the god of war and the chase; Nergal, the god of death; Gibil, the fire-god; and many local spirit-demons. In addition to the numerous native gods, the Babylonians incorporated many foreign divinities into the pantheon, especially those of their Kassite rulers, such as Samalia, Suga-Muna, and Kit, the Kassite sun-god.

The City of Babylon.—The accounts that we find in the ancients of the origin, the greatness, and the structure of the city are exceedingly confused. The god Belus is named as its founder, and also Queen Semiramis; how we are to understand the two statements is not explained. Semiramis, according to the account of Diodorus, employed on it two millions of workmen, collected from all parts of her dominions. With the capital of the older kingdom, the accounts of the ancients known to us have, for the most part, nothing to do; they are all to be referred to the resuscitated and adorned residence of Nebuchadnezzar. Herodotus gives a description of the city, as if from his own observation. It stood on both sides of the river, in the form of a square, the length of whose sides is variously given; by Herodotus it is stated at 120 stadia, making the whole circumference 60 miles. It must be remembered, however, that the walls, like those of most oriental towns, inclosed rather populous districts than cities, so that the whole mass of the population might easily find shelter within the space inclosed. It was surrounded by a wall 200 cubits high, and 50 cubits thick, and furnished with 100 brazen gates—the last number is raised by Diodorus to 250. The city was built with extreme regularity, with broad straight streets crossing one another at right angles; and the two parts were connected by a roofed bridge built of hewn stones, fastened together with iron clamps. Of this bridge, not a trace has yet been discovered. The western part of the city is undoubtedly the older, belonging to the early and properly Babylonian dynasty. Here stood, in the middle of the city, as it is described, the famous temple of Belus or Baal, called by the Arabs, Birs Nimrud (see BABEL, TOWER OF). The next important point on the west side is the mass of ruins called Mujellibe, which was probably the royal citadel of the old Babylonian monarchy. On the east side of the river stood the buildings of the Neo-Babylonian period, among which the 'Hanging Gardens' of Semiramis are to be singled out as one of the wonders of the world. Of these gardens Diodorus has left us a detailed description. Their ruins may be recognised in the mound called El-Kaasr. The city suffered greatly from the Persian conquest. When it revolted under Darius I., and, after a siege of two years, was recaptured through the ingenuity of Zopyrus, the outer walls were demolished. Xerxes plundered the temple of Belus, which had been hitherto spared, and Herodotus found it empty. Although the Persian kings made Babylon their residence, nothing was done for the restoration of the city; and Alexander the Great, who, on his entrance, in 331 B.C., had promised the inhabitants to rebuild the ruined temple, was unable even to clear away the rubbish, although he employed 10,000 workmen for two months. After his death in the palace of Nebuchadnezzar, and the foundation of Seleucia on the Tigris by Seleucus Nicator, Babylon went rapidly to decay. This was partly owing to the new city's being built of the materials of the old, and partly to the want of durable materials for monumental buildings. Stones of any size had to be brought from the mountains of Armenia; their place was mostly supplied by burned brick. As early as the

time of Pausanias, there was little to be seen but the ruins of the walls. The older Arabian geographers know, indeed, of a village, Bâbil, but speak more of the great masses of ruins. Since the time of Della Valle, who erroneously looked upon the ruin Mujellibe as the tower of Belus (in which he is followed by Renne), the site of Babylon has been the object of many travels and researches. The greater number of the explorers, among whom Rich is the most distinguished, consider the town of Hillah, with 7000 inhabitants, as the representative of the ancient Babylon. The great masses of ruins, from which we must not, with Renne, exclude the Birs Nimrud, embrace, indeed, an enormous extent, but agree perfectly with the accounts of the ancients in being arranged in the form of a square.

Babylonish Captivity, the deportation, under Nebuchadnezzar, of a large portion of the principal inhabitants of Judah, after the fall of Jerusalem, 586 B.C. It must be carefully distinguished from the carrying into Assyria of a large number of the inhabitants of the northern kingdom—the ten tribes—by Sargon, the successor of Shalmaneser, as early as 721. A large number of the inhabitants of Judah had been already carried off to Babylon in 597, when Zedekiah had become king over the remainder. It was not long before these excited the anger of the powerful Chaldean king, and the second capture of the city and captivity of the inhabitants put an end to the kingdom of Judah. They were carried to Babylon, and there they remained in tolerable comfort for 56 years, though the duration of the Captivity is usually reckoned at 70 years, dating from the earlier captivity. Many of them acquired property, and even riches; some were called to court, and even raised to high offices in the state. They were allowed the free exercise of their religion, and here Ezekiel and the unknown author of the last part of the book of Isaiah gave hope to the spiritual aspirations of the despondent people. When Cyrus overthrew the Babylonian empire (538 B.C.), he allowed the Jews to return to their own country, but only 42,360 of the tribes of Judah, Benjamin, and Levi are said to have returned. They found the depopulated territory occupied with a mixed population from the surrounding tribes and the residue of the Jewish population; and with the religious isolation they had learned in Babylon, refused to recognise these as members of their own community. See JEWS.—The name is frequently applied in church history to the exile of the popes at Avignon from 1309-77.

Babyroussa. See BABIROUSSA.

Bac'carat (Fr. *Baccara*) is one of the most widespread French games of chance, played for money between a banker and several punters. In Britain, as a game of cards other than a game of skill, it is treated as 'unlawful.' See GAMBLING.

Bacchiglion'e, a river of Northern Italy, rising in the Alps, and flowing 90 miles south-eastward, through the plain of Padua, and past the town of Vicenza, till it falls into the Adriatic 3 miles south of Chioggia.

Bacchus, one of the names among the Greeks and the usual name among the Romans for Dionysus, the god of wine. Originally a mere epithet or surname, it does not occur in Greek writers till after the time of Herodotus, and its use is generally confined to the god in his more riotous aspects. The name Dionysus occurs also in Latin, though not in the Augustan poets. His worship was introduced into Rome from Greece, and was amalgamated with the worship of Liber, an old Italian deity who presided over planting and fructification. The Liberalia, celebrated every year on the 17th of March, on which day youths received the manly toga, must be distinguished from the triennial Bacchanalia or Dionysia. The latter, soon after its introduction into Italy, became the cloak for shameful immorality and crime, but was finally prohibited by the senate, 168 B.C. See DIONYSUS.

Baccio'chi, MARIA BONAPARTE, eldest sister of Napoleon Bonaparte, born at Ajaccio, Corsica, 1777, married Felice Bacciocchi, and was created by her brother in 1805 Princess of Lucca, Piombino, Massa, and Carrara, and in 1809 Grand-duchess of Tuscany. She shared her brother's fall, and spent her last years in Austria, dying on her estate near Trieste, August 7, 1820. Her husband died in 1841; her only son, in 1833; and her only daughter, the Countess Camerata, in 1869.

Baccio della Porta. See BARTOLOMEO, FRA.

Bach, JOHANN SEBASTIAN, one of the supremely great musicians of the world, was born at Eisenach in 1685, probably on 21st March, as he was baptised on the 23d of the month. The family, which traced its origin from one Veit Bach, a baker and miller who lived about 1550, and was exceedingly fond of music, had already produced many musicians, among whom two brothers, cousins of Sebastian's father, Ambrosius, were the most eminent. Johann Christoph and Johann Michael Bach wrote several excellent motets, and their writings had considerable influence on their illustrious kinsman. The love of music was so general throughout the family, that at Erfurt, where one branch of the clan was settled for many years, the town-musicians were commonly called 'the Bachs,' even though there might not be any member of the family among them at the time. Before he was ten years old, Sebastian lost his father, and was placed under the care of an elder brother, Johann Christoph, who was organist at Ohrdruf. He undertook the boy's musical education, but apparently in dread of his too rapid progress, kept from him a manuscript volume of organ pieces by various masters. Sebastian managed to obtain possession of the book by drawing it through the lattice of the bookcase in which it was locked away, and to copy its contents, working only by the light of the moon for fear of detection; his sole reward for six months' labour was the confiscation of his copy on its discovery by his brother. In 1700 he entered the choir of St Michael's school at Lüneburg, remaining there, after his beautiful soprano voice had broken, as accompanist on the harpsichord, and also as a violinist. During this period he made several excursions to Hamburg, where a cousin of his, Johann Ernst Bach, was living, in order that he might hear the famous organist Reinken play. In 1703 he was given a court appointment at Weimar, where he had the opportunity of hearing a great deal of Italian instrumental music; in the following

year, while on a visit to some of his many relations at Arnstadt, he was offered the post of organist to the New Church, and it was here that he began to compose in real earnest. Many of his 'church cantatas' were written here, as well as the famous 'Capriccio on the Departure of a Brother,' composed when his brother, Johann Jakob, went to join the Swedish Guard. In October 1705 he obtained four weeks' leave of absence in order to go to Lübeck and hear Buxtehude, the great Danish organist and composer, who was then nearly seventy years old. Bach was so delighted with him and his compositions that he outstayed his leave of absence, and on his return the authorities censured his conduct in this and other matters, such as accompanying the hymns in a manner that did not suit the taste of the congregation. His intimacy with a cousin of his, Maria Barbara Bach, who had lately come to Arnstadt, was also made a ground for reproof; so that he began to look for a new post. This he found at Mühlhausen, where he was installed in June 1707. On 17th October of that year he returned to Arnstadt in order to marry the cousin just mentioned, and settled down to his new work. He only remained at Mühlhausen one year, since a far more congenial sphere of action presented itself at Weimar, where he was now appointed court organist. The nine years spent at the ducal court did much to perfect Bach's style as a composer for the organ, and some of the best of his cantatas were also written there. The works of the great Italian composers of the time were studied in such a manner that Bach soon became complete master of their style of writing, and thus prepared for his own instrumental works which were to be produced later. Many journeys were made from Weimar, the most famous of which is one that resulted in the discomfiture of a French harpsichord player named Marchand. In 1717 Bach went to Dresden, where this man's playing was universally admired; the merits of the two musicians were hotly discussed, and it was determined that Bach should challenge Marchand to a public musical competition. The Frenchman accepted the challenge, but when the day came, was nowhere to be found. He had enough perception to see that the competition could only bring defeat upon himself, and so had beaten a retreat. Soon after this, Prince Leopold of Anhalt-Cöthen offered Bach the post of capellmeister at his court, a situation which he retained till 1723. A journey to Halle, made with the purpose of seeing Handel, who was there at the time, failed of its object, as Bach got there too late; nor was a subsequent attempt to meet his great contemporary more successful. A severe calamity befell him in 1720, when his wife died during his absence with the prince at Carlsbad; he bore her loss, however, manfully, and went on with his accustomed duties, paying another visit to Reinken at Hamburg in the same year. In December 1721 he married Anna Magdalena Wülkens, daughter of the court trumpeter at Weissenfels. She was extremely musical; much of his music exists in copies made by her hand, and many of his works for keyed instruments were written for her use. Most of the well-known 'suites' date from this time, as well as many works for stringed instruments. The first half of the wonderful collection of *Forty-eight Preludes and Fugues*, called in Germany *Das Wohltemperirte Clavier*, was also written at Cöthen, the second half being composed many years afterwards. At the end of the year 1722 the post of Cantor of the Thomas-schule at Leipzig became vacant, and after some difficulties and delays Bach was given the appointment. During his residence at Leipzig, all his greatest works for chorus were written, among

which the most important are the two settings of the history of the Passion, in the versions of St Matthew and St John respectively, many church cantatas, the total number of which, together with those already mentioned, reached nearly three hundred, and the Mass in B minor. Two movements from this latter work were presented to Augustus III. at one of Bach's frequent visits to Dresden, where he received in 1736 the honorary title of Hofcomponist. A more famous visit was that paid to Frederick the Great at Potsdam, in May 1747. His arrival was announced to the king while a state concert was going on; Frederick immediately laid down his flute, and sent for Bach to come to court just as he was. Some pianofortes made by Silbermann were tried by Bach, who subsequently improvised on a theme given to him by the king. This theme he afterwards worked up in many different ways, and presented the result to Frederick under the title of *The Musical Offering*. This, like the *Art of Fugue*, a work begun about this time, and upon which he was engaged at the time of his death, is a monument of contrapuntal ingenuity and theoretical learning. Some two and a half years after this visit, his eyesight began to give way, and he was persuaded to have recourse to an English oculist then resident in Leipzig. The failure of an operation resulted in absolute blindness, and worse than that, the remedies used affected his health. In July 1750 he was struck with apoplexy, and died on the 28th of the month.

No composer who ever lived can be held to surpass Bach either in the ease of his intricate workmanship or in the wealth of invention with which he was endowed. The broad effects which came so easily to Handel, and by which so many thousands have been impressed, did not come within Bach's province; but in his 'B minor mass,' for instance, there are revealed depths of sorrow and heights of ecstatic adoration, which no musician before or since his time has ever attained. That his music appeals less to the untaught than to the cultivated lover of the art, cannot surely be held as a reproach. His greatest compositions for keyed and stringed instruments, taxing as they do the utmost powers of modern artists, must have been far beyond the reach of the executants of his own day. The pianist of the present day owes to Sebastian Bach not only the system of tuning by which he is enabled to play in all keys, but the method of fingering by which all his fingers are brought into requisition. Several other inventions were made by Bach, but none have been proved of lasting value. One of his sons, Carl Philipp Emanuel, holds an important place in the history of music, since he did much to develop the so-called 'sonata-form,' in which all classical compositions of modern times are cast, and moreover became the teacher of Joseph Haydn. Wilhelm Friedmann, Sebastian's eldest son, dissipated his fine musical talents, leaving comparatively few compositions; the youngest son, Johann Christian, has some interest for Englishmen, since he established himself in London, holding positions there of some consideration. The various biographies of the master, by Forkel (1803), Hilgenfeldt (1850), Bitter (2d ed. 1880-81), and others, have been completely superseded by Spitta's exhaustive work (2 vols. 1873-80; Eng. trans. 3 vols. Novello, 1884-85). Among English books on the subject, Mr R. Lane Poole's contribution to the 'Great Musicians' series, and Mr C. H. H. Parry's *Studies of Great Composers*, may be consulted with advantage.

Ba'charach, a small town of Rhenish Prussia, on the left bank of the Rhine, 30 miles S.E. of Coblenz by rail. Pop. (1885) 1840. Its name is said to be a corruption of *Bacchis ara* ('Bacchus'

altar'), and the vine is still largely cultivated in the neighbourhood. Here Blücher crossed the Rhine on January 1, 1814.

Bache, ALEXANDER DALLAS, American physicist, a grandson of Benjamin Franklin, was born at Philadelphia, 19th July 1806, and in 1821 entered West Point military academy. He was appointed professor of Mathematics in the university of Pennsylvania (1827), president of Girard College (1836), and superintendent of the coast survey (1843), in which last capacity he did good service to science. He was author of *Observations at Girard College* (3 vols. 1840-47) and *Lectures on Switzerland* (1870), the latter a posthumous work, as he died at Newport, Rhode Island, 17th February 1867.

Bachelor, a word of uncertain origin, derived, perhaps, with most probability through French from the Low Latin *baccalarius*, 'a farm-servant,' originally 'a cow-herd,' from *bacca*, Low Latin for *vacca*, 'a cow.' Odd though it seem, this will connect fairly with the special meanings of the word given by Ducange. (1) It was used, he says, to indicate a person who cultivated certain portions of church-lands called *baccalaria*, a feu belonging to an inferior vassal. (2) It indicated monks in the first stages of monkhood. (3) It was used by later writers to indicate persons in the probationary stage of knighthood—i.e. not squires simply, but knights who, from poverty and the insufficient number of their retainers or from nonage, had not yet raised their banner in the field. (4) It was adopted to indicate the first grade or step in the career of university life. As an academical title, it was first introduced by Pope Gregory IX. in the 13th century, into the university of Paris, to denote a candidate who had undergone his first academical trials, and was authorised to give lectures, but was not yet admitted to the rank of an independent master or doctor. At a later period, it was introduced into the other faculties as the lowest academical honour, and adopted by the other universities of Europe (see DEGREE, UNIVERSITY), and in this sense the Latin form came to be written, at first through mere word-play, *baccalaureus*, as if connected with *bacca lauri*, 'laurel berry.' (5) It came to be used in its popular meaning of an unmarried man, who was thus regarded as a candidate or probationer for matrimony.

The legislation of almost every country, at some period of its history, has imposed penalties on male celibates or bachelors, on the principle that every citizen is bound to rear up legitimate children to the state. In Sparta, at Athens, and at Rome, various penalties were imposed on celibates, various premiums offered for fruitfulness. In England, there are numerous instances of additional or higher taxes being imposed on bachelors and widowers, but apparently more with a view to the revenue than with any other object. Thus, an act was passed in 1695, which granted to the king certain rates and duties upon marriages, births, and burials, and upon bachelors and widowers for five years, 'for carrying on the war against France with vigour.' Every unmarried male above the age of twenty-five had to pay from 1s. to £12, 10s., according to his status. Another instance may probably be found in the higher charge for the servants of bachelors, first imposed by Pitt in 1785, and continued for a considerable time. In the income-tax of 1799, deductions were made on account of children, 5 per cent. being allowed to a person who had a family, and whose income was above £60 and under £400 a year, with corresponding deductions in other cases.

Bachelor, KNIGHT. See KNIGHT.

Bachelors' Buttons, the popular name of the double-flowered yellow or white varieties of Buttercup (*Ranunculus acris*, &c.), frequently cultivated in gardens. It is an excellent and effective perennial, suitable to the herbaceous border, and gives no trouble in cultivation.

Bacillus (late Lat., 'little rod,' diminutive of *baculus*, 'stick'), properly the name of a distinct genus of Schizomycetes, but popularly used in the same sense as bacterium. See BACTERIA.

Back, SIR GEORGE, Arctic explorer, was born at Stockport in 1796, and entering the navy in 1808, next year was taken prisoner by the French in Spain. With Franklin (q.v.) he had already shared in three Polar expeditions—to the Spitzbergen Seas (1819), the Coppermine River (1819-22), and Mackenzie River (1822-27)—when he volunteered to go in search of Captain Ross, who was supposed to have been lost in his attempt to discover the North-west Passage. His offer having been accepted, he left London in February 1833, and on the 28th June started from a station of the Hudson Bay Company, on his journey north. After passing a terrible winter with his companions near the Great Slave Lake, he discovered, in 1834, Artillery Lake, and the Great Fish River, or Back's River, which he traced to the Frozen Ocean. Hindered by the ice from proceeding along the coast, he returned by the river, and did not reach England till the autumn of 1835, when he was raised to the rank of captain by order in council, an all but unprecedented honour. In 1836 and 1837 he further explored the Arctic shores; and of this, as in the preceding voyage, he published a vivid description. The Geographical Society, in the latter year, bestowed both its medals upon him; and in 1839 he was knighted. He was made admiral in 1857; but the hardships which he had gone through disabled him from further active service. He died 23d June 1878.

Backergunge. See BAKERGANJ.

Backgammon, a game of considerable antiquity in England, where, until the 17th century, it was known by the appellation of 'the tables.' Apparently the word is merely 'back-game,' and may have been given because the two players have to bring their men *back* from their antagonist's tables into their own, or because the pieces are sometimes taken up and obliged to go *back*—i.e. re-enter at the table they came from. The French name is *tric-trac*. Backgammon is played with a board or tables, men or pieces, dice, and dice-boxes. The introduction of dice into the game, and their constant use in determining moves, makes backgammon essentially a game of chance. The backgammon board consists of two parts or tables, each possessing twelve points, six at each end, which points are coloured white and black alternately. The game is played by two parties, and with 30 pieces or men. Each party has 15 men, one set of 15 being black, and the other white. In beginning the game, the men are placed on certain points on the tables, as shown in the following figure. The game is played with two Dice (q.v.) and two dice-boxes. The dice are common to both; but each party uses his own dice-box, and the throws are alternate. If a player throws *doublets*, or both dice of one number, double the number of dots is reckoned; thus, by a throw of two aces, the player does not count 2, but 4. These numbers thrown or accidentally turned up by the dice bear a reference to the points on the tables. In order to understand this connection between the dice and the men, the learner must observe how the men are placed on the points, and the rules by which their shifting from one to another is governed.

The tables are here spread out as if two persons were seated, and about to begin to play. The player owning the white men is seated at W, and the player owning the black men at B. We shall call one player White, and the other Black. White counts round from the ace-point of Black, and Black counts round from the ace-point of White.

W

B

The Backgammon Table.

These ace-points are respectively seen to have two men upon them in opposite corners of the same table. The grand object of the game is for each party to get all his men played round into the table containing the aces, removing them from point to point agreeable to the throws of the dice. In throwing, the number upon each die turned up may be reckoned by itself, or collectively, with the number on the other die. Thus, if 4 be thrown by one die, and 6 by the other, a man can be advanced 4 points, and another 6 points; or one man can be advanced 10 points, always providing that a point is open to suit this movement to it. No point can be moved to if covered by two men belonging to the adversary. If covered by only one man, which is called a *blot*, then that man can be hit, and be removed from the point, and placed on the bar between the tables, his place being taken by the man who has won it. The removal of a man to the bar throws a player considerably behind in the game, because the man must remain out of the play till the dice turn up a number corresponding to an open point on the adversary's table. Being fortunate to get an open point by this means, the man must be entered and wrought round from thence, as in the case of others in the set to which he belongs. The frequent occurrence of this hitting of a blot gives an adversary a great advantage, and allows him to win the gammon. There are two kinds of victory—winning the hit, and winning the gammon. The party who has played all his men round into his own table, and by fortunate throws of the dice has borne or played the men off the points first, wins the *hit*. The gammon may be explained as follows: When you have got all your men round to your own table, covering every point, and your adversary has a man out, then you are enabled to *bear* or *lift* your men away. If you can bear all away, so as to clear your table before the adversary gets his man placed by a throw on your table, you win the gammon. If the adversary has been able to bear one before you have borne all your men, it reduces the victory to a hit. Two hits are reckoned equal to one gammon in playing matches. To win two games out of three is called winning the *rub*, as at whist.

Backhuysen, or BAKHUIZEN, LUDOLF, a famous marine painter of the Dutch school, was born at Emden in Hanover, in 1631, and in 1650 was placed as a clerk in Amsterdam. He, however, resolved to devote himself to painting, and with that object received instruction from Everdingen and Dubbels, in a short time attaining extraordinary skill and readiness in execution. His most famous picture is the sea-piece in the Louvre, which he was commissioned to paint by the magistrates of Amsterdam, and which was in 1665 sent as a present to Louis XIV. In all the utmost truthfulness prevails; his colouring is excellent, though somewhat cold; his earlier are preferred to his latest pictures. He etched on copper, and gave lessons in caligraphy. He died in 1708.

Bacolor, a town of the island of Luzon, Philippines, 10 miles NW. from Manila. Pop. 8737.

Bacon, DELIA, American authoress, born 1811, died 1859. She was eminent in her day as a teacher, and wrote several stories, but is now remembered only as an eloquent advocate of the theory that the plays of Shakespeare were written by Lord Bacon. She herself did not originate the idea, but was the first to give it any currency, in her *Philosophy of the Plays of Shakespeare Unfolded* (1857). The book had the honour of a preface from the pen of Nathaniel Hawthorne, and the theory has been accepted by a few persons in both England and America, who, though more noisy than numerous, have wasted not a little ingenious reasoning in its advocacy. In W. N. Wyman's *Bibliography of the Bacon-Shakespeare Controversy* (Cincinnati, 1884), there are no less than 255 entries, of which as many as 73 are books or pamphlets on the wrong side of this question.

Bacon, SIR NICHOLAS, was born in 1509, most likely at Chislehurst, Kent, and passing from the abbey school at Bury to Corpus College, Cambridge, (1523), was ten years later called to the bar. In 1537 he was appointed solicitor to the Court of Augmentations, and in 1539, on the dissolution of the monasteries, he presented to Henry a reasonable project for applying their revenues to the founding of a college for the study of diplomacy. Unfortunately, the king had already dispersed the forfeited estates. Of these the young lawyer received no small share; and in 1546 he was advanced to the office of attorney of the Court of Wards. During Mary's reign his Protestantism cost him all his public honours and emoluments; but on her death in 1558, he received from Elizabeth the post of lord keeper of the Great Seal. Elizabeth left to him and to Cecil 'the ordering of church matters for the most part;' and Parker chiefly owed to him the see of Canterbury. He was always honestly opposed to Catholics generally, above all, to Mary of Scotland. Elizabeth honoured him with several visits—one of six days in 1577, at his magnificent mansion of Gorhambury, Hertfordshire. He died at York House, his London residence, 20th February 1579. A profound lawyer, and all but a great orator, Sir Nicholas was one of those solid and stately Englishmen to whose sagacity, high principle, and firm demeanour England owed its safety in that critical period when Elizabeth mounted the throne.

Bacon, FRANCIS, Lord Verulam and Viscount St Albans, born at York House, in the Strand, London, 22d January 1561, is usually, but inaccurately, spoken of as Lord Bacon. He was the younger son of Sir Nicholas Bacon (q.v.) by his second wife Ann, second daughter of Sir Anthony Cooke, Edward VI.'s tutor. Bacon passed his boyhood with his elder brother Anthony under the stern discipline of his mother, a woman of powerful will and a zealous Calvinist. When twelve years old (1573), he, with

Anthony, entered Trinity College, Cambridge, where the brothers remained till Christmas 1575. In June 1576 they began to study law as 'ancients' of Gray's Inn. A year later, Bacon went to Paris in attendance on the ambassador Sir Amias Paulet, but his father's death recalled him in 1579. Little property fell to his share, and he applied himself anew to the law, being called to the bar in 1582, and becoming a benchor of his inn in 1586.

From an early age Bacon exhibited extraordinary intellectual capacity. Queen Elizabeth noticed his precocity when he came to court with his father: at Cambridge the youth recognised the barrenness of scholastic philosophy and the need of educational reform, and soon afterwards became conscious of power in himself to apply to science original methods of study, which should extend man's knowledge of nature beyond any limits yet reached. To fulfil this ambition he resolved to adapt his career. Lucrative employment was necessary to supply him with the means of research, and he was twice injudicious enough (1580 and 1592) to assert openly that he subordinated everything to his 'contemplative ends,' when petitioning the powerful minister Burghley, who had married his mother's sister, for place about the court. Burghley declined to aid him, and to advance his worldly interests Bacon added to his legal practice an independent pursuit of politics. He became member of parliament for Melcombe Regis in 1584, for Taunton in 1586, and for Middlesex in 1593; and sought to attract the queen's attention by addressing to her a paper of advice in 1584, in which, with a boldness unique in a barrister of three-and-twenty, he argued for more tolerance in the treatment of recusants, and by writing in 1589 a statesmanlike pamphlet on the controversies in the Anglican Church, in which he pleaded for elasticity in matters of doctrine and discipline. These efforts were overlooked, and in 1593 he offended the queen by opposing in parliament the grant of a subsidy. Meanwhile, in despair of obtaining any favour from Burghley, Bacon attached himself to the brilliant and impulsive Earl of Essex, Burghley's rival at court, through whom he thought to put into effect some of his political schemes. Essex, who also took Bacon's brother Anthony into his service, strove in vain to obtain for Bacon in 1593 the office first of attorney and then of solicitor general, and in 1596 that of master of the rolls. Bacon's disappointments were embittered by want of money, and he gladly accepted from Essex a gift of land at Twickenham. To enable Essex to secure a permanent hold on the queen's favour, Bacon recommended him to employ petty tricks of flattery, which were ill adapted to his frank and impulsive character, and Bacon soon found that he had misunderstood his patron. He advised him in 1598 (although he afterwards denied having done so) to undertake the suppression of Tyrone's great rebellion in Ireland, and when the earl returned thence in disgrace (September 1599) and was tried in June, Bacon, at his own request, acted (in a subordinate capacity) with the prosecuting counsel, in the hope, as he said, of aiding his patron. Essex was dismissed from all offices of state, and released in August. Bacon, like his brother Anthony, seemed anxious for his reinstatement in the queen's favour, but when Essex broke into open rebellion in January 1601, Bacon voluntarily endeavoured to secure his conviction on the capital charge of treason; drew up after the execution the official declaration of Essex's treasons; and apologised in another paper for his own conduct, on the ground that the maintenance of the state is superior to private ties of friendship.

In the last years of Elizabeth's reign, Bacon tried,

in and out of parliament, to act the part of mediator between crown and commons, and recommended a tolerant policy in Ireland. On James I's accession (1603), Bacon sought royal favour by extravagant professions of loyalty; by planning schemes for the union of England and Scotland, and for pacifying the Church of England on comprehensive lines; and by making speeches in parliament, in which he tried to prove that the claims of the king and parliament could be reconciled without degrading either estate. For these services he was knighted (23d July 1603), and was made a commissioner for the union of Scotland and England. In 1604 he received a pension of £60 a year in consideration (as the patent stated) of James's respect for his brother Anthony, who had died in 1601, after proving himself a staunch champion of the Scottish succession. In 1605 Bacon showed how his leisure had been employed, by publishing the *Advancement of Learning*; and on 10th May 1606 he married Alice Barnham, a London alderman's daughter, of whose personal character nothing is known. His public fortune had now changed. On 25th June 1607 he became solicitor-general, after a delay caused partly by the opposition of Burghley's son and successor, Sir Robert Cecil, and partly by Bacon's unwillingness to serve under Sir Edward Coke, a personal enemy, who was attorney-general till 1607.

In the last session of James's first parliament (February 1611) the differences between crown and commons grew very critical, and Bacon assumed his former rôle of mediator, although he confessed his distrust of James's chief-minister, Cecil (now created Lord Salisbury). At the same time he argued in published tracts that reform could best be assured by a liberal use of the king's prerogative. On Salisbury's death in 1612, Bacon informed the king that he was willing to devote himself exclusively to politics, and offered to manage parliament and to obtain supplies without concerting undignified bargains after Salisbury's discredited methods. He was disappointed of the office of master of the wards at this time, but, on 27th October 1613, was promoted to the attorney-generalship. In the 'Addled Parliament' of 1614 Bacon was still sanguine of effecting what he called his policy *e gemino*, according to which the interests of king and people should be made to coincide. A sympathetic atmosphere between the two bodies was to be developed, and mutual concessions were to follow, accurately defined and spontaneously rendered. In October 1615 he pleaded in vain for a new parliament, while re-announcing his sanguine views. By that date Bacon saw that James was as little likely as Essex to adopt his domestic policy, and soon perceived that the bold handling of foreign affairs, which he regarded as essential to the conservation of patriotism, was alien to the nature of a king who delighted in intricate diplomacy. But Bacon craved for personal advancement with increased eagerness, and henceforth he obtained it by suppressing his real opinions, by conventional flattery of all who could serve him, and by systematising petty tricks of conduct in order to circumvent the opposition of those likely to obstruct him.

In 1615 two prosecutions in which he engaged illustrate his servility. In one, Oliver St John was prosecuted for denouncing the illegality of benevolences, and made his submission. In the other, Edmund Peacham, an old Somersetshire clergyman, was charged with having written a sermon, which he had not preached, justifying insurrection under certain circumstances. Torture was applied with Bacon's assent, although not at his suggestion, and Bacon examined the prisoner while undergoing it,

without extracting any information. It was then resolved to prosecute Peacham for treason in the King's Bench, and Bacon undertook to confer separately and privately with each judge of the court, in order to secure a conviction. Three judges yielded to Bacon's advice, but Coke resisted, and at the trial denied that Peacham, who was convicted and died in prison, was guilty of treason. In 1616 Bacon prosecuted Somerset, with whom he was intimate, for the murder of Overbury, and in that and the next year helped to secure Coke's dismissal from the bench, on the grounds, first, that the judge denied the superiority of the Court of Chancery to his own Court of King's Bench, and secondly, that he allowed the king's prerogative to be questioned in an exchequer case.

On 9th June 1616 Bacon became a privy councillor, and on 7th March 1617 Buckingham, whom Bacon had persistently courted, obtained the lord-keepership for him. On 7th January 1618 he became lord chancellor, and on 12th July he was raised to the peerage as Lord Verulam. The title was taken from *Verulamium*, the Latin name of St Albans, near which lay Bacon's estate of Gorbamby. Bacon's obsequiousness was now more marked than ever. He accepted the king's policy of the Spanish marriage, although it was hostile to all his principles, and by exceptional self-abasement averted a quarrel with Buckingham, whose brother's marriage with Coke's daughter Bacon had vindictively opposed. A word from Buckingham influenced his behaviour to suitors in the Court of Chancery, where he worked hard in clearing off arrears. In one case, a Dr Steward complained to Buckingham that Bacon had decided a case against him; Buckingham wrote to Bacon expressing his surprise, whereupon Bacon cancelled his decision, and referred the case anew to arbitrators outside the court. Bacon was on the side of severity in the cases of Raleigh (1618) and of his own friend Sir Henry Yelverton (1619). In 1620 he advised the summoning of a new parliament; on 12th October in that year published his *Novum Organum*; and on 26th January 1621, was created Viscount St Albans. But his fall was now at hand. The Commons, led by Bacon's enemy Coke, first inquired into a recent increase of monopoly-patents, by which Buckingham had enriched his relatives. Bacon had argued for their legality, and parliament was anxious to call him to account for this opinion, but the king refused to sanction the step. Complaint was then made that Bacon was in the habit of taking bribes from suitors in his court, and on 17th March 1621, charges were sent to the House of Lords by the Commons for inquiry. Bacon fell ill. That he took presents from suitors was undeniable, but that he allowed these gifts to influence his judicial decisions has been disputed with some effect. Nevertheless, the Steward case shows that Bacon was guilty, in one instance at least, of polluting justice. On 20th April, a copy of the accusation was sent him, and a week later he submitted himself to the will of his fellow-peers, without offering any defence. It was ordered that he be fined £40,000, be imprisoned during the king's pleasure, and be banished parliament and the court. In June he was released from the Tower, and retired to his family residence at Gorbamby, near St Albans. In September the king pardoned him, but declined to allow him to return to parliament or the court. Bacon employed himself in literary work, completing his *Henry VII.* and his Latin translation of his *Advancement* (*De Augmentis*). In March 1622 he offered to make a digest of the laws, but no further notice was taken of him in spite of the frequent petitions that he addressed to Buckingham, James I., and James's successor, Charles. In

March 1626 he caught cold while stuffing a fowl with snow near Highgate, in order to observe the effect of cold on the preservation of flesh. He was removed to the neighbouring house of Lord Arundel, where he died on 9th April. He was buried in St Michael's Church, St Albans. He was fond of pomp in his domestic arrangements, and died deep in debt.

Bacon's literary work occupied the greater part of his time throughout his life. It is divisible into philosophical, purely literary, and professional writings. To the first the chief importance is to be attached. Bacon's philosophy is to be studied in (1) *The Advancement of Learning* (1605), a review in English of the state of knowledge in his own time, and its chief defects; (2) *De Augmentis Scientiarum* (1623), a Latin expansion of *The Advancement*; and (3) *Novum Organum, or Indications respecting the Interpretations of Nature* (1620), which was intended to form the second book of a never-completed greater treatise, *Instauratio Magna*, a review and encyclopædia of all knowledge. To the *Novum Organum*, preliminary drafts of which are to be found in a number of detached pieces, *Cogitata et Visa*, *Temporis Partus Masculus*, &c., was prefixed a *Distributio Operis*, a plan of the greater work; and in *Historia Ventorum* (1622), *Historia Vitæ et Mortis* (1623), *Historia Densæ et Rari* (1658), and *Sylva Sylvarum* (collection of collections, 1627), materials chiefly consisting of digested facts of natural history, for other portions of the *Instauratio*, are extant.

Bacon's system for interpreting Nature which was to lay the foundations of the natural sciences is exhibited in all these works. He first abandons the deductive logic of Aristotle and the schoolmen, in which preconceived theories were constructed without reference to actual fact, and were syllogistically arranged to lead to elaborate conclusions never tested by observation and experiment. Bacon relied on inductive methods—on the accumulation and systematic analysis of isolated facts to be obtained by observation and experiment. From this assemblage of facts alone were any conclusions to be drawn. The induction was to rest not on a simple enumeration of phenomena, a method familiar to predecessors of Bacon, but on their careful selection and arrangement, with necessary rejections and eliminations. 'Phantoms of the human mind'—'*idols*' (*eidōla*) of the tribe, the cave, the market-place, and the theatre, as Bacon called them—inherited by man, or produced by his environment, were exposed and swept aside. Nothing was to obscure the 'dry light of reason.' Bacon took all knowledge for his province, and his inductive system was to arrive at the causes not only of natural but of all moral and political effects. While developing his new scientific method, Bacon made some shrewd scientific observations. He described heat as a mode of motion, and light as requiring time for transmission, but he was behind the scientific knowledge of his time; knew nothing of Harvey's discovery of the circulation of the blood, or of Kepler's calculations, and rejected the Copernican system of astronomy. His system was never finished. He never reached his examination of metaphysics—of final causes—which was to succeed his treatment of physics.

His greatness consists in his repeated insistence on the facts that man is the servant and interpreter of Nature, that truth is not derived from authority, and that knowledge is the fruit of experience. The impetus which his inductive methods gave to future scientific investigation is indisputable. As he himself described it, he 'rang the bell which called the other wits together.' He was the practical creator of scientific induction, and although

succeeding scientific experimentalists may have been unconscious of their indebtedness to him, their chief results are due to their adoption of his logical method. An attempt has been made to credit Bacon with the parentage of the English philosophy of Hobbes, Locke, and Hume. That Bacon, like these philosophers, was an empiricist or realist is obvious; but that his philosophy was systematic enough to originate a school of thought, in the same sense that Descartes and Hegel founded a philosophic school, is untrue.

As a writer of English prose and a student of human nature, Bacon is seen to best advantage in his Essays, ten of which were first published in 1597; after passing through new editions in 1598, 1604, 1606, and 1612, they reached the final number of 58 in 1625. Full of practical wisdom and keen observation of life, written in concise language of extraordinary pith and dignity, they illustrate the worldly shrewdness of their author, as well as his quickness and accuracy of perception. His *History of Henry VII.* (1622) shows scholarly research, besides a direct and nervous style. In his fanciful *New Atlantis*, Bacon suggests the formation of scientific academies—a suggestion to which the foundation of the Royal Society has been traced. Bacon's *Apophthegms* (1625) are a disappointing collection of witticisms. His religious works included prayers and a verse translation of the Psalms (1625), which display a personal piety difficult to reconcile with his conduct. Bacon's professional works embrace *Maxims of the Law* (1630), *Reading on the Statute of Uses* (1642), pleadings in law cases, and speeches in parliament. Dr Rowley, Bacon's chaplain in 1638, and Isaac Gruter in 1653, at Amsterdam, issued imperfect collected editions of Bacon's works. Others followed in 1730 (by Blackburn), and in 1825–36 (by Basil Montagu). The last was superseded only when Spedding, Ellis, and Heath produced their complete collection (14 vols. 1857–74), seven volumes of which were devoted to the apologetic *Life and Letters* by Mr James Spedding, that great storehouse for Bacon's biography. The fullest description of the Baconian system is given in Kuno Fischer's *Francis Bacon von Verulam* (Leip. 1856; Eng. trans. 1857). Professor Fowler's edition of the *Novum Organum* (Oxford, 1878) is also useful. Macaulay's brilliant attack on Bacon's character, and eulogy of his philosophy (first issued in *Edinburgh Review*, July 1837), lack sobriety in both sections. Mr S. R. Gardiner's account of Bacon in his *History* and in the *Dictionary of National Biography*, where Bacon is represented as a far-seeing politician, Dean Church's monograph in the *Men of Letters Series* (1884), and Dr Abbott's *Life* (1885), form valuable commentaries on Spedding's conclusions.

'For my name and memory,' Bacon wrote in his will, 'I leave it to men's charitable speeches and to foreign nations and the next ages.' An unparalleled belief in himself, which justified to himself his ignoring of all ordinary laws of morality, is the leading feature in his character. He was taught by the example of the Machiavellian politicians who were his father's friends, to disregard elementary notions of right and wrong; in early youth he was conscious from the first of the possession of intellectual power which, if properly applied, could revolutionise man's relations with nature, and as a consequence, he recognised no justice in any moral obstacle which might prevent his attainment of such material wealth and position as would enable him to realise his intellectual ambition. Neither Macaulay's mingled contempt and admiration, nor Pope's popular epigram in his *Essay on Man* (iv. 281–2)—

If parts allure thee, think how Bacon shined;
The wisest, brightest, meanest of mankind—

is an adequate summary of his character. Bacon found it necessary to turn much of his attention to politics in his attempt to gain worldly power, and showed there some of his mental capacity. But he was never absorbed in politics, and always regarded himself (as he phrased it) in great part a stranger in the political sphere; his political principles were not large enough or definite enough to enable him to play a commanding part in the constitutional crisis. He did not make sufficient allowance at any time for the natural dispositions and abilities of the men with whom he worked. He drew up practical rules and sketched out elaborate tricks for the conduct of those who, like himself, were the architects of their own fortunes. But he failed entirely as a manager of men. It is only in scientific and literary work that he was great; but there very few have proved greater.

Bacon, JOHN, sculptor, was born in London, November 24, 1740, and, trained as a modeller and painter on porcelain, in 1769 he received the first gold medal for sculpture awarded by the Royal Academy, of which next year he was made an associate, in recognition of the high merit of his statue of Mars. Among his principal works are the monuments to Lord Chatham in Westminster Abbey and the Guildhall, to Howard and Johnson in St Paul's, and to Blackstone at All Souls' College, Oxford. Bacon's success aroused great jealousy, and his rivals claimed that he was deficient in imagination, and had no refined perception of beauty; but some of his emblematical figures display perfect classical taste. He died 4th August 1799.

Bacon, ROGER, a monkish philosopher of the 13th century, who, through the force of his intellect, raised himself far above his age, made wonderful discoveries in several sciences, and contributed much to extend the then scanty knowledge of nature. Belonging to a well-to-do family, he was born at Ilchester, Somersetshire, about the year 1214. He studied at Oxford, where he seems to have been in orders in 1233, and then proceeded to Paris. About 1250 he returned to Oxford, and may then have entered the order of the Franciscans. Physics seems to have been at that time the chief object of his labours; and liberal friends of science supplied him with the means of pursuing his researches. In exploring the secrets of nature, he made discoveries and invented applications which were looked upon by the ignorant as the work of magic. This prejudice was encouraged by the jealousy and hate with which his brother monks regarded his superiority. About 1257 he was imprisoned at Paris, forbidden all human intercourse, and even all opportunity of writing. Among the few clear-sighted men who admired Bacon's genius and pitied his misfortunes, was Guy de Foulques, sometime papal legate in England. He desired to see Bacon's writings, but the interdiction of the Franciscans prevented a compliance with his wish. On Guy's ascent, however, of the papal throne as Clement IV. in 1265, Bacon wrote to him expressing his readiness to furnish him with whatever he desired, and Clement in reply repeated the request to see his works. Bacon accordingly drew up his *Opus Majus*, which he sent, along with two other works, it is said, to the pope, by his favourite pupil, John of London, and in which he represented the necessity of a reformation in the sciences through a diligent study of the languages and of nature. How Clement received them is not very well known; but they could only have reached him about the time he was seized with his last illness in 1268. The year before, Bacon had regained at least comparative freedom; but in 1278 the general of the Franciscan order, Jerome of Ascoli, declared

himself against Bacon, forbade the reading of his books, and issued an order for his imprisonment, which was sanctioned by Pope Nicholas III. This new imprisonment lasted ten years. When in 1288 Jerome himself became pope, under the name of Nicholas IV., Bacon sent him a treatise on the means of warding off the infirmities of old age, with a view to convince him of the harmlessness and utility of his labours, but in vain. He seems to have at last recovered his freedom about 1292, and two years later to have died at Oxford. A true forerunner of his greater namesake, Bacon in spite of his extraordinary genius could not rid himself of all the prejudices of his time. He believed in the philosopher's stone and in astrology. His chief invention is the magnifying-glass. There are also in his writings other new and ingenious views on optics; for example, on refraction, on the apparent magnitude of objects, on the great increase in the size of the sun and moon in the horizon. On other subjects, again, he fell into the greatest errors. He made several chemical discoveries which were wonders at that time. He knew, for instance, that with sulphur, saltpetre, and charcoal, we may produce explosions. Mathematics applied to observation he considered to be the only means of arriving at a knowledge of nature. He studied several languages, and wrote Latin with great elegance and clearness. Deserving of honourable mention are his discoveries of the errors that prevailed in the calendar, and his proposals and data for remedying them, in which he came very near the truth. He prepared a rectified calendar, of which a copy is preserved in the Oxford library. On account of his extensive knowledge, he received the name of 'Doctor admirabilis.' Six of his works had been printed between 1485 and 1614, when, in 1733, S. Jebb edited the *Opus Majus*. Professor Brewer edited the *Opus Tertium*, *Opus Minus*, and *Compendium Philosophiæ* in 1859, under the title of *Opera Inedita*, with a valuable preface. See also E. Charles, *Bacon, sa Vie, ses Ouvrages, ses Doctrines* (1861); the German works of Siebert (1861), Schneider (1873), Werner (1879), and Held (1881); and, for the popular conception of Bacon as 'Friar Bungay,' Ward's *Old English Drama* (1878).

Bacon, the back and sides of a pig, cured or preserved for eating by salting and drying. The mode of curing will be described under HAMS; and their properties as articles of food, under PORK. The word has come into English through the medium of French, from an old Teutonic root (seen in old Dutch *baken*, 'bacon'), from which also is descended the word *back*.

Bacon Beetle. See DERMESTES.

Bacsanyi, JÁNOS, a Hungarian poet, was born May 11, 1763, at Tapolca. His first work, published in 1785, procured him an appointment in a public office, but a liberal poem cost him this in 1793, as well as his liberty the year after. In 1796 he came to Vienna, and here he married a few years later the German poetess, Gabrielle Baumgarten—an unhappy match. In 1809, Bacsanyi translated Napoleon's proclamation to the Hungarians, and was afterwards obliged to take refuge in Paris. After the peace of Paris, he lived at Linz, and there he died, May 12, 1845. His collected poems appeared at Pesth in 1827.

Bács-Bodrog, a county in the south of Hungary, between the Danube and the Theiss. Area, 4260 sq. m.; pop. (1881) 638,063. The land is low and marshy, and very unhealthy, but of great fertility. It produces the best wheat; and wine, tobacco, and cattle are also exported. The capital is Zombor (q.v.).—Bács is a village of 3000 inhabitants.

Bacteria (plural of late Lat. *bacterium*, Gr. *baktērion*, dimin. of *baktron*, 'stick,' 'staff'). It is a familiar fact that if water which contains or has contained organic matter either of animal or vegetable origin be left to itself, it soon becomes cloudy and covered with a film. If the floating flakes or surface scum be examined with the high power of a microscope, a marvellous exhibition of the lowest forms of life is presented. Representatives of the simplest animals, such as Infusorians, will probably be seen, and in some cases also some of the lowest single-celled plants, but all these will appear as giants amid a crowd of dwarf organisms, most of which are Bacteria. These usually appear as minute spheres, rods, or threads, propelled along by delicate lashes, or quivering together with the usual tremulousness of very small floating particles, or lying more passively entangled in a jelly-like flake. In a short time it will be seen that these bacteria multiply with extraordinary rapidity by cross division; one soon becomes a thousand, and the minute specks which first appear may, if the water contains enough food, soon form a mass filling the vessel. Wherever organic matter is in process of decomposition, in infusions as above indicated, or in disease or death, or within the living and healthy organism, there these bacteria are to be found.

So abundant are they, that in spite of their minuteness they did not escape the enthusiastic observation of the early workers with the microscope. Thus, in the 17th century, and with the comparatively imperfect microscope of those days, Leeuwenhoek described some of these low organisms. In 1773 O. F. Müller established two genera, *Monas* and *Vibrio*. Not much progress was made, however, till about 1838, when Ehrenberg and Dujardin included bacteria in their investigation of minute organisms. They referred the forms which they described to the animal series among Infusorians, and united a large number under the general title *Vibrionia*. Nor was this reference surprising. At that time naturalists had hardly begun to realise that animals had no monopoly of mobility, though it is now a commonplace observation that the simplest plants exhibit a power of locomotion which is almost wholly lost in the higher forms. The argument in favour of the animal nature of bacteria which was once furnished by their movements is thus no longer specially cogent. That was not all, however. It is well known that the vast majority of plants have a characteristic way of feeding—deriving their carbon from the carbonic acid gas mixed with the air or water, and their other food-products from inorganic substances in aqueous solution. They take up the matter necessary for nutrition in a much simpler form than is possible for animals. This they are able to do as regards the carbon through their possessing the power of making a green colouring matter known as chlorophyll, by the aid of which the carbonic anhydride is absorbed and split up in sunlight. Animals, on the other hand, are only able to utilise food-products which have already been lifted up to a comparatively high level, which have in fact been worked up by plants or by other animals into complex compounds known as albuminoids—fats, starch, sugar, and the like. They cannot directly feed on the carbonic anhydride of the surrounding medium, nor on inorganic substances in solution in water. An appreciation of this physiological difference between plants and animals led to some difficulty in regard to the position of forms like bacteria. For in the first place they have no chlorophyll wherewith to utilise carbon at the low level of carbonic acid gas, and in the second place the nature of their occurrence

plainly shows that they feed on the products of decomposition of plants or animals—physiologically speaking, very much as animals do. But as the forms and life-history of the simplest organisms were gradually elucidated, it became evident that such physiological distinctions were not only not hard and fast, but were delusive as a basis of classification. It was seen that though bacteria and other lowly organisms now known as simple fungi did not feed as the majority of plants do, yet they were in structure and development so entirely like unmistakable vegetables—the simple *Algae*—that separation was impossible. To Cohn (1853) is due the merit of having established, on grounds of structure and life-history (morphology and development), the fact that bacteria are plants, and all succeeding research has confirmed his conclusion, which Nägeli (1857) corrected in detail, however, by referring the bacteria or Schizomycetes not to *Algae*, but to the parallel class of *Fungi*.

The bacteria or schizomycetes may thus be defined as extremely small, single-celled fungoid plants without chlorophyll, remaining single or united in loose colonies, reproducing rapidly by cross division or by the formation of spores, often occurring in myriad crowds enveloped in a jelly-like secretion, or separately with the power of energetic movement, and almost always associated with the decomposition of albuminoid substances.

Terminology.—The term micro-organism is convenient as a general word, especially when the position of the form in question is still undetermined. The French word *microbe*, introduced by Sédillot in 1878, has been approved by Littré, and is very widely used. It means a small living organism, and was invented to avoid dispute as to the plant or animal nature of low organisms like bacteria. It is now virtually equivalent to the latter. *Bacterium* is, like *bacillus*, properly the name of a distinct genus of schizomycetes, but the generic titles have both been too indiscriminately bestowed to be of much use, and are better restricted to popular designation. The term *bacteria* will be used throughout this article as equivalent to the technical title *schizomycetes*.

The physiological significance of bacteria in relation to disease and fermentation will be the special subject of the article *GERM THEORY*. The present article has to do with the following points only—(1) distribution; (2) form and structure; (3) life-history; (4) general classification; (5) more important forms; and (6) the methods of research. For further details as to position and classification, see *SCHIZOMYCETES*.

I. Distribution.—Bacteria are found practically everywhere—in air, water, and soil; in the mouths of men as well as on the walls of their houses; on the hair of the head and the toes of the feet; in chalk and coal; in food and drink; but especially where there is disease, death, or decomposition. To speak of the 'omnipresent bacillus' is hardly an exaggeration.

(a) *Air*.—In the observatory of Montsouris, in Paris, M. Miquel has charge of a special laboratory for investigating the times and seasons of atmospheric germs. In Britain also, some attention has recently been directed to the prevalence of micro-organisms in the air of various regions—lodging-houses, school-rooms, sewers, &c. In a cubic metre of Montsouris air there are on an average eighty bacteria. The maximum abundance is in autumn, the minimum in winter. The number rises in drought, and is reduced by heavy rainfall. Winds from crowded quarters, hospitals, slaughter-houses, &c., float a large number of microbes to the observatory, but pure air from lofty regions was found to contain hardly any. Sunlight is probably the most effective antagonist of these subtle enemies.

Some bacteria can only live in presence of atmospheric oxygen, and these are termed by Pasteur *aerobic*; others derive their oxygen from the organisms or decomposing media in which they live, and these are known as *anaerobic*.

(b) *Water*.—Even pure water contains many bacteria, and always more than occur in air. The minimum occurs in condensed water-vapour (900 to the litre), the maximum (80 millions per litre, 1½ pint) of course in sewer water, especially if there be the least stagnation. If there be a proper flow of water, however, the germs never become dry enough to be floated in the air, and are not therefore dangerous. The sulphurous springs of the Pyrenees contain an abundant bacterium (*Beggiatoa*), which accumulates sulphur in its cell, and is especially abundant in the floating scum known as *glairine* or *barégine* (see *BARÉGINE*). Some bacteria, often called *chromogenic* (or colour-making) on account of their bright pigment, occur in water under certain conditions, and have given rise to superstitious accounts of 'blood-rain.' The red colour of stagnant pools in autumn has been known for fifty years as the result of a micro-organism, described by Ehrenberg as *Ophidomonas sanguinea*, but now known as a species of *Spirillum*. It rapidly changes from green to red, and if a waterspout draw up and re-discharge the bacterium-laden water, a shower of 'blood-rain' is no longer mysterious. Snow is sometimes coloured in a varied way by the presence of a similar organism (*Micrococcus*); which is not, however, to be confounded with the much larger *Protococcus* of 'red snow.'

(c) *Soil*.—Nor is soil free from bacteria. Spring-water fresh from the source carries a cargo of these micro-organisms. Pasteur found that the germ of splenic fever (*Bacillus anthracis*) occurred in great abundance in the earth round about the pits in which diseased cattle had been buried. He also found bacteria in the earthy excrement of worms. Some refer the origin of most epidemic diseases to the ascent of these deadly germs from the soil, and if this be in any way true, the danger of drying marshes, of narrowed river beds, and of dust generally, is obvious enough. Some striking researches by M. Béchamp go to show that bacteria may lie dormant in soil for an incalculable period. A fresh piece of chalk taken from the quarry, with due care to exclude extrinsic germs, gave rise to abundant bacteria. He also discovered their presence in coal, but was unable to bring the sleeping germs into life again. Micro-organisms of modern date have also been found abundantly by M. Parize in the bricks of walls, and others have been found in association with the formation of saltpetre in the soil.

(d) *Food, &c.*—The rancidity of butter, the putrefaction of cheese, the game-flavour and high odour of meat, the yellowness and blueness of milk kept in imperfectly scalded vessels, the excessive staleness of bread, and a crowd of other unhealthy conditions in food, are largely due to the presence of bacteria. Bloody stains on bread, meat, paste, &c., have also been traced to the presence of a brightly coloured micrococcus. In the same way the bitterness, ropiness, &c. of bad wine are due to the same organisms.

(e) *Decomposition and Disease*.—A large number of bacteria are known to occur in direct association with pathological processes of decomposition in plants and animals, without apparently having any direct connection with the decomposition. These are *Saprophytes* (q.v.), like fungi generally. Others, however, have been proved in many cases to be the causes of pathological conditions in men and animals, a profound fact fundamental to the Germ Theory (q.v.) of disease. In contrast to the sapro-

phytic bacteria, these are conveniently described as pathogenic. It must not be supposed, however, that the presence of a bacterium in an organism is necessarily associated with abnormal decomposition or with disease, since some occur quite normally, and without any evil influence.

II. *Form and Structure*.—As regards the shape of the individual units, four principal forms may be distinguished—viz. spherical, elliptical, rod-like,

Fig. 1.—Different Forms of Bacteria (after Zopf):

a, Micrococcus; b, Macrococcus; c, Bacterium; d, Bacillus; e, Clostridium; f, g, h, i, ciliated phases; k, Spirochaeta; l, Leptothrix; m, Spirillum.

and spirally curved. It must be noted, however, that a bacterium may, as Lister and others have shown, pass from one form to another in response to different physiological conditions, that a species spherical in its young stages may be elliptical or cylindrical afterwards, or that a rod-like form, such as *Bacterium lactis*, which causes lactic acid fermentation, may become thread-like or spiral when sown in urine.

Bacteria do not, however, remain single, but reproduce by division, and the results of division may remain loosely united. (1) The spherical micrococcus and the elliptical or cylindrical bacterium always divide in one direction, and the resulting couple may remain temporarily united, or continue multiplying to form a myriad colony embedded in a jelly (zoogloea). (2) In *Bacillus*, *Leptothrix*, and *Beggiatoa*, the cells may form long cylindrical threads, and this is varied in *Vibrio*, *Spirillum*, and *Spirochaeta* by the development of spiral or wavy curvature. (3) In *Sarcina*, again, the division takes place in three planes, and the result is obviously the formation, not of long chains, but of cubical clumps. Just as among simple

Fig. 2.—Multiplication of Bacteria (after Zopf):

algae, so here the results of division form—(1) isolated spheres; (2) longitudinal or even branching filaments; and (3) planar expansions, always, however, extremely minute.

Structure.—The unit mass of protoplasm which forms the bacterium individual is always inclosed in a membrane, which sometimes consists of the cellulose characteristic of the cell-walls of plants, but more frequently of a peculiar albuminoid substance which has been designated mycoprotein. This membrane may be stiff or flexible, colourless or brightly pigmented, and undergoes uniform increase in thickness. The contained protoplasm

consists largely of the above-mentioned mycoprotein, and may include fat-like granules, particles of pure sulphur, grains of starchy material, and dissolved pigment often of a brilliant colour. No nucleus has yet been detected. In all bacteria, except those which form long filaments, locomotor organs are present at some stage or other, as delicate lashes or cilia always situated terminally. These have been oftenest observed in the young swarm spores, and 1-4 may be present. In the adult forms they apparently arise when the protoplasm is needing oxygen, like the long tongues in a dying flame, and they serve to hurry the bacterium to the surface or to some position where oxygen is more abundant.

III. *Life-history*.—It is convenient to distinguish in the life-history three important events or processes—(a) increase in size and modification of form; (b) reproduction; (c) the assumption of the resting form known as zoogloea.

(a) *Increase in Size and Modification of Form*.—As the result of abundant nutrition, the bacterium unit increases in size, and this growth necessitates division, and is associated with change of form. The minute spherical cocci usually grow into rod-like or cylindrical shapes, and these little rods divide rapidly, ranging themselves in rows to form filaments. In those filaments the original distinctness of the component units is often lost. Nutritive and other conditions, however, affect the form, both of the separate rods and of the composite filaments. Both exhibit a tendency to be more or less spirally curved. Thus wavy forms arise from the straight, and their history shows that the longer forms arising from rows of straight rods are really multicellular, whether they appear to be so or not. This modification of form is technically known as the pleomorphism of bacteria. The various forms—filamentous, incipiently branched, and plane—which are exhibited as the results of multiplication, have been already referred to. One other fact must be noticed, that the composite chain of bacterium units never remains perfectly uniform throughout. The parts of the chain are not all in exactly the same physiological conditions, and variations therefore occur abundantly. The end of the thread may become much enlarged, or here and there individual masses may preponderate in size over their neighbours. These variations offer interesting parallels to those occurring in filamentous algae.

(b) *Reproduction*.—The more complete the degree of parasitism in fungi, the more probable is the absence of sexuality. In bacteria, the multiplication is an entirely asexual process. The absence of anything of the nature of sexual union may perhaps in part explain the infinitesimal minuteness of the individuals; and again, since the bacteria live to a certain extent bathed in waste products, the stimulating character of the medium has been regarded as a physiological substitute for the stimulus to division usually supplied by fertilisation. The process of multiplication which invariably occurs is by means of division. The coccus or rod-like form becomes somewhat elongated, a double partition wall is developed in the middle, and the two daughter cells are thus formed. If the results remain united, and if the lines of division be all in the same direction, the filaments above mentioned must arise. The resulting forms recall species of *Nostoc* and other Algae. When the division occurs in more than one plane, the result is the formation of plates as in *Bacterium marismopedioides*, or of packets as in *Sarcina ventriculi*, or of discs as in *Crenothrix*.

Besides this external and successive fission, another process is frequently observed in which the divisions occur in a less definite way. Spiral or

other forms are seen to divide rapidly into fragments, either at once externally, or at first only internally. The rupture of the flexible filament occurs in the more passive middle portion, and each half again splits, and so on. The liberated fragments grow again to the adult size.

But in addition to these entirely vegetative processes, bacteria also reproduce by means of special cells—the spores. The contents of the units contract, become rounded off, and surrounded by a

Fig. 3.—Formation of Spores (after Zopf):

a, b, c, *Clostridium*, spore at free end, or at both ends; d, spores forming at certain points in chain, e.g. *Leuconostoc*; e, *Bacillus anthracis*, spores in one stretch of the filament; f, g, ciliated swarm spores.

membrane. It is a special case of internal (endogenous) division, and has been observed in cocci, rods, and spiral forms. In some cases, such as *Clostridium butyricum*, of butyric acid fermentation, the cells which will give rise to spores can be distinguished from the others before the spores have begun to appear. Spore-formation appears to set in as a response to insufficient nutrition, as is the case in very many instances of reproductive activity. The liberated spores germinate and develop into the adult forms. Often ciliated in their young stages, they become more quiescent with increasing size.

(c) *Formation of Zoogloea*.—Wherever bacteria have been allowed to flourish unmolested, jelly-like flakes or clumps are found. These were formerly regarded as distinct forms and called zoogloea, but they are now recognised as a phase in the life-history. Such gelatinous clumps are often conspicuous both in size and colour; thus that of *Clostridium polymyxa* may measure more than an inch across, while the 'frog-spawn' zoogloea occurring not unfrequently in the beetroot juice used in sugar manufacture, may attain a size of more than a foot. These zoogloea consist of myriad colonies of bacteria embedded in a jelly. Their formation is due on the one hand to the aggregation of resting bacteria, arising from one mother cell or from several, and on the other hand to the thickening and gelatinisation of the individual membranes. The same habit of aggregation is not uncommonly exhibited by simple unicellular organisms, and also by the cells of higher animals, though in these cases the individual units fuse more or less completely to form a composite mass or plasmodium. Nor is the gelatinous degeneration of the membrane in any way unique, but is exhibited both by algae and fungi.

IV. *Classification*.—A thorough classification of bacteria has yet to be elaborated. The multitude of forms differing in comparatively trivial points of structure, the insufficient state of our knowledge of the life-history of many genera, the difficulties involved by the abundant pleomorphism, the existence of weighty physiological differences between forms which seem otherwise absolutely alike, make a dogmatic classification at present quite impossible. In 1838 Ehrenberg distinguished four genera—(1) *Bacterium*—straight and rigid; (2) *Vibrio*—snake-like and flexible; (3) *Spirillum*—spiral and rigid; (4) *Spirochæte*—spiral and flexible; while Dujardin united the two last into one genus. In 1872 Cohn, to whom so much progress in bacteriology has been due, distinguished four dis-

tinct tribes—(1) Sphærobacteria—globules (*Micrococcus*); (2) Microbacteria—short rods (*Bacterium*); (3) Desmobacteria—long rods (*Bacillus* and *Vibrio*); Spirobacteria—spirals (*Spirochæte* and *Spirillum*). This classification held ground for a few years, but has been abandoned for a reason which must already be obvious. In 1873 Lister was the first to hint at the fact of pleomorphism. He showed that certain forms referred to different genera and groups were really phases in one and the same life-cycle. The mistake had been made of separating young and adult stages, and of regarding as permanent and fundamental shapes and habits which were only temporary and transitional. Till the life-history of all the forms is completely known, the same mistake in this, as in other departments, is sure in some degree to persist. What Lister suggested was in the same year even more conclusively demonstrated by Lankester. Forms belonging to different groups of Cohn's

Fig. 4.—Different Phases of one Form—*Cladotrix dichotoma* (after Zopf):

a, branched form; b, one twig of the same; c, a small portion of a twig; d, this breaking up; e, f, g, progressive division into little rods, and then into cocci.

classification were shown to be successive chapters in the life-history of one species. The researches of Billroth (1874), Klebs (1875), Nägeli (1877), Warming, and others, but most of all, perhaps, of Zopf, have established the prevalence of pleomorphism, and have made this fact at least certain, that whatever the final classification is to be, it must be one which takes account, not of specific facts of form, but of the whole round of the life-history, and of the sum-total of morphological and physiological properties. Any classification especially of lowly organisms, where the range of differentiation is always comparatively slight, ought to take account particularly of the two planes of development—vegetative and reproductive (see ALGÆ). But as we have seen, the range of vegetative modification is very limited in bacteria, and the same is true of what of the reproductive processes is now known. De Bary has, however, suggested the distinction of two great groups—those which form spores (endospores), and those which become divided into segments which are equivalent to spores, but are not internally formed (arthrospores). With further knowledge of the reproductive processes, the classification will be gradually elaborated. Two other points must not be overlooked. Recent studies on fungi and algæ, which differ so markedly in the respective absence and presence of chlorophyll, tend increasingly to emphasise the close correspondence in structure and life-history between different groups in these two classes of plants. Instead of there being two separate

branches in the genealogical tree, one representing fungoid, and the other algoid forms, it has been repeatedly suggested that the various subdivisions of the fungi are to be regarded as the chlorophyll-less representatives of parallel subdivisions among algae. This must be kept in view in regard to bacteria. Before proceeding to note the most familiar classification and some of the more interesting forms, it must be again observed that a few of the generic titles have come to be used in very vague and ambiguous ways. This is so conspicuous in regard to the terms *Bacterium* and *Vibrio*, which have been used so widely that some authorities incline almost altogether to suppress them as accurate generic designations. The provisional classification now most commonly adopted is that of Zopf, as expressed in the following table. He distinguishes four groups—(1) *Coccaceæ*; (2) *Bacteriaceæ*; (3) *Leptotrichææ*; (4) *Cladotrichææ*.

(1) *Coccaceæ*.—Only cocci, singly or in contact. Division in one or more directions.

(2) *Bacteriaceæ*.—Mostly with cocci, and also rods (straight or bent), and thread-forms (straight or spiral), without distinction between base and apex. Division in one direction.

(3) *Leptotrichææ*.—Cocci, rods, and thread-forms (straight or spiral), with distinction between base and apex.

(4) *Cladotrichææ*.—Cocci, rods, threads, and spirals. Thread-forms with false branches.

V. *Important Forms*.—(1) *Coccaceæ*.—*Streptococcus* is a genus with numerous species, some associated with disease in men and animals—e.g. with diphtheria, yellow-fever, foot-and-mouth disease, others merely feeding on the results of pathological processes, and a few entirely unassociated with diseases of animal life. Cubes or packets of *Sarcina* are found forming coloured patches in various situations. *Micrococcus* has been observed in cases of scarlatina, measles, whooping-cough, typhus, &c., but their precise rôle is not certainly determined. *Hydrophobia* is believed by many to be due to the presence of a micro-organism, and *micrococcus* has been observed in this connection.

Fig. 5.—Different kinds of Bacteria (mostly after Koch): A. Micrococci, in drinking-water; B. in splenic fever; C. in cholera (Koch); D. from surface of water; E. in splenic fever (in thread-form, and with incipient spores); F. *Spirillum*, from putrefaction; G. *Spirochete*, from the teeth; H. in relapsing fever, from blood; I, different forms of cholera microbe (Koch).

The researches of M. Pasteur have thrown light on this problem. Many micrococci are apparently

simply saprophytic, following and not causing pathological processes. *M. amylovorus* has been described as the cause of 'fire-blight' on pear-trees and other plants. Many of these forms are brightly coloured, as, for instance, that species which causes the blood-red sweat in the human armpit and elsewhere.

(2) *Bacteriaceæ*.—Species of bacterium have been found associated with pneumonic disease, diphtheria, &c.; others cause fowl-cholera, pebrine of silkworms, and other diseases of animals; and a large number have been described apart from any directly pathological connection. *Bacterium prodigiosum* forms blood-red zoogloea, and occurs on bread, paste, milk, and such commodities. Its appearance has given rise to superstitious anecdotes about 'blood-rain,' and the like. In 1843 this fungus was so prevalent in Paris that it caused a sort of bread-plague, especially in the military bakehouses. *B. aceti* oxidises the alcohol of wine and other fruit-juices into vinegar. *B. termo*, which is so often described as an almost omnipresent organism, is apparently only a phase in the life-history of many different forms. A species of *Spirillum* is believed to be the cause of relapsing fever, and Koch has described another form—the *Comma bacillus*—which he has found associated with Asiatic cholera. A large number of species are known apart from disease. The frog-spawn fungus, otherwise known as *Leuconostoc mesenteroides*, is of some importance, since it sometimes invades and corrupts the beet-root juice and molasses used in sugar manufacture. *Bacillus* is a large genus with numerous formidable species associated with the diseases of men and animals. Such are the bacillus of leprosy, syphilis, and typhoid fever, tuberculosis, splenic fever, glanders, swine fever, &c. The bacillus of 'blue milk,' of hay-infusion, and *Bacillus septicus* of putrid albuminous fluids, may be noted as examples of forms unassociated with disease. A species of *Clostridium* is the cause of the disease of cattle known as 'black leg' or 'quarter-evil'.

(3) *Leptotrichææ*.—A species of *Crenothrix* with long filaments is sometimes abundant enough to stop up narrow water-pipes. *Beggiatoa* occurs in various forms in sulphur springs, on sea-water, on the surface of marshes, &c. The best-known species has a peach-blossom red colour. *Leptothrix buccalis* occurs abundantly in the mouth, and is apparently associated with the decay of teeth.

(4) *Cladotrichææ*.—As a representative of this last group of bacteria, *Cladotrich dichotoma* must be noted, a form with false branches, occurring more abundantly than any other in water containing organic matter.

VI. *Methods of Research*.—Besides the usual apparatus of any well-equipped laboratory for the study of minute structures and organisms, a number of special appliances are required for the successful investigation of bacteria. Thus, since the intrusion of germs other than those which are the specific object of research is a constant danger, there must be some means for sterilising the tubes, tools, media, &c. This is generally done by means of a steam or hot-air steriliser, in which all the extrinsic germs are killed off. Incubators are also used for purposes of cultivation. The bacteria obtained in endless ways may be examined as they are, or stained with reagents to bring out the individual structure, or since the life-history is all-important, left to grow, and watched at their successive stages. They used to be left in some sterilised fluid, such as broth, blood-serum, urine, milk, or Pasteur's fluid, and allowed to grow in test-tubes, or other vessels, plugged with cotton-wool. It is, however, exceedingly difficult to get a perfectly pure fluid medium, nor was it possible in such cases to isolate

the different kinds of bacterium which might be present. In view of this, Koch has recently introduced the method of cultivation on sterile solid media. Sterile nutrient gelatine, or some such substance, is liquefied in a tube and inoculated with the bacteria in question. These are distributed through the fluid, which is then poured out on a plate of glass and left to solidify. The various bacteria can no longer move about and mingle with one another, but are fixed to one spot, where they develop. The resulting fixed colonies can thus be studied without confusion. Slices of sterilised potatoes are also very frequently used as solid media for the cultivation of bacteria. Finally to elucidate the relation of a micro-organism to a given disease, it is necessary not only to have obtained it from an organism suffering from the said disease, but it is imperative that some of a pure cultivation be introduced into a healthy organism, to see whether it does or does not cause the disease. The inoculation may be brought about by inhalation, or along with the food, or by injection in some form or other.

How such methods have, in the hands of investigators like Pasteur and Koch, resulted in discoveries of profound importance, not only to a scientific theory, but to the practical amelioration of life, will be discussed in other articles.

See ALGÆ, ANTISEPTICS, FERMENTATION, FUNGI, GERM THEORY, INFECTION, SCHIZOMYCETES, &c.; also Zopf's monograph on *Bacteria, Die Spaltpilze* (Braunschweig, 1885); De Bary's *Lectures on Bacteria*, (2d ed. Leip. 1887); Klein's *Micro-organisms and Disease* (Macmillan, 1886); Trouessart's *Microbes, Ferments, and Moulds*, Int. Sc. Ser. (1886); Löffler's *History of Bacteriology*; Crookshank's *Manual of Bacteriology* (Lewis, Lond. 1887). Abundant references will be found in the last-mentioned.

Bactria, a province of the ancient Persian empire, lying north of the Paropamisus (Hindu Kush) Mountains, on the Upper Oxus. A northern branch of the same range separated it from the Sacæ, and it had Sogdiana on the north and Ariana on the south. It thus corresponded pretty nearly with the modern Balkh. Here many scholars locate the original home of the Aryan or Indo-European family of nations (see ARYANS). Its capital, Bactra or Zariaspa, was also the cradle of the Zoroastrian religion. Originally a powerful kingdom, it maintained its independence until its subjugation by the great Cyrus about 540 B.C., when it became a satrapy of the Persian empire. It was included in the conquests of Alexander, and formed a part of the kingdom of the Seleucids until the foundation, about 256 B.C., by Diodotus, of the Greek kingdom of Bactria, which extended to the Indus, and which after a long struggle was overthrown by the Parthians. Numerous coins with Greek legends have been found in the *topes* or burial-places to the north-east of Kabul. See also ASOKA, and ALPHABET, p. 188.

Bactrites, a genus of fossil Ammonitidæ, with a straight shell, and indented but not ramified septa. The genus ranges from the Lower Silurian to the Devonian.

Baculites, a genus of the family of Ammonitidæ, differing from the true Ammonites (q.v.) in the perfectly straight form of the shell, which tapers to a point, and is either round or compressed. The species, like the other Ammonitidæ, are all fossil. Baculites are characteristic of

Baculite. the chalk, and appear to have existed only towards the expiry of the period over which the existence of the Ammonitidæ extended.

Ba'cup, a rapidly increasing and very prosperous town of Lancashire, on the Spodden rivulet,

19½ miles N. by E. of Manchester by rail. Besides many churches of all denominations, the oldest dating from 1788, it has a mechanics' institute (1846, enlarged 1870), a market-hall (1867), a very large co-operative store that cost £22,000, &c. Ba'cup was constituted a municipal borough in 1882. Cotton-spinning and powerloom-weaving are the staple industries; and there are also dye-works, brass and iron foundries, and vast stone quarries. Coal-mines are worked in the neighbourhood. Pop. (1798) 1426; (1861) 10,935; (1871) 17,199; (1881) 25,033.

Badagry, a small British port on the Slave Coast, Upper Guinea. At one time it carried on a large slave-trade, and had 10,000 inhabitants. It was from this place that in 1825 Clapperton and Lander started on their expeditions to explore the African interior.

Badajoz, capital of the Spanish province of the same name, is built on a slight hill crowned by a Moorish castle, on the left bank of the Guadiana, crossed here by a stone bridge of 28 arches. It is but 5 miles from the Portuguese frontier, and is 174 miles from Lisbon, and 315 from Madrid by rail. Badajoz is a fortress of the first rank, and the see of a bishop, and has an old cathedral built like a fortress, with a splendid organ, and paintings by Cerezo and Morales. Its monasteries have been secularised, and some of its nunneries closed. Its chief articles of manufacture are hats, soap, coarse woollens, leather, and pottery. It has also a large trade in cattle. Pop. (1884) 22,376. Badajoz was the *Pax Augusta* of the Romans, the *Baz Augos*, *Bathaljus* of the Moors. As one of the keys of Portugal, it has often been a place of importance in war. It was besieged in vain by the Portuguese in 1660, and again by the allies, in the Spanish War of Succession, in 1706. During the Peninsular war, Badajoz was besieged by the French in 1808, and in 1809, and again in 1811, when it surrendered, March 11, to Soult. It was thrice besieged by the English under Wellington; first on April 20, 1811, next in May and June of the same year, and thirdly in the spring of 1812, when he captured the city by storm, on the night of April 6, after a murderous contest, and a loss during the twenty days' siege of 72 officers and 963 men killed, and 306 officers and 3483 men wounded. The province of Badajoz has an area of 8687 sq. m., and a population of (1884) 457,365. See ESTREMADURA.

Badakhshan, a territory of Central Asia, lying between 36° and 38° N. lat., and 69° and 72° E. long., with the chain of the Hindu Kush on the S., and the Oxus, or Amu Darya, on the N. It is drained by the Kokcha, a head-stream of that river, and is famous throughout the East as a picturesque hill-country diversified with woods, rich pasture, and fertile, well-cultivated valleys, its surface varying from 500 to 15,600 feet above sea-level. Eastern travellers speak with rapture of its orchards, its fruits, flowers, and nightingales. It is rich too in mineral wealth—iron, rubies, and lapis-lazuli. Marco Polo was here in 1272-73; and Captain John Wood in the winter of 1837-38. Matveyeff saw part of the country in 1878. Faizabad (q.v.) is the capital. The inhabitants are largely Tajiks, an Aryan race speaking Persian. They are Mohammedans—Shiites in the mountains, and Sunnites in the plains. Their number is estimated at 100,000. The people of Badakhshan seem to have been always under the immediate rule of their own chiefs, at the head of whom is the Amir. They have generally, however, formed part of some great Asiatic empire. Thus, in the 18th century, Badakhshan belonged to the empire of Nadir Shah, after whose death it became subject to the Afghans. In 1923, however, the Uzbeks,

under Murad Beg, taking advantage of the disturbed state of Afghanistan, defeated the tribes of Badakhshan in a pitched battle; and two years after, their subjection was completed. The conquerors treated them most harshly, demolishing their towns, and either selling them as slaves, or carrying them off to people the unhealthy swamps of Kunduz. On Murad's death in 1845, Badakhshan passed to another Uzbek. The Afghans, however, soon reasserted their claims, and in 1859 were about to annex Badakhshan, when the Amir agreed to pay an annual tribute. In 1863 Jahander Shah, the Amir of Badakhshan, was superseded by Mahommed Shah. This gave rise to a struggle which ended in Jahander's nephews acquiring dominion by means of Afghan help. In 1873 England and Russia discussed and agreed upon a frontier between Badakhshan and Afghanistan. In September 1887 the Amir strictly prohibited Russians from entering the country. Badakhshan is sometimes made to include Wakhan, on the Upper Oxus, between Badakhshan proper and the Pamir Steppe (see *PAMIR*, and the map at *AFGHANISTAN*). See Yule's *Marco Polo* (1871); Wood's *Journey to the Source of the Oxus* (new ed. 1872); and Vambéry's *Central Asia* (1874).

Badalona, a seaport in the Spanish province of Barcelona, 5 miles N.E. of that town by rail. The fertile plain around is covered with gardens and orange-groves; the town has shipbuilding and a large glass-work. Pop. (1878) 13,749.

Badderlocks, also sometimes *HONEYWARE* or *HENWARE* (*Alaria esculenta*), an olive-coloured seaweed belonging to the *Phaeosporae* (see *SEAWEED*), and allied to the common *Laminaria*, which grows on rocks in deep water on the shores of Britain, Iceland, and the northern parts of Europe. It has a short cylindrical stem with lateral spore-bearing processes, and a membranous olive-green frond of 2-12 feet long, with a stout midrib. This midrib, together with the 'fruits,' is eaten by the inhabitants of the sea-coasts of Iceland, Denmark, Scotland, Ireland, &c., and is said to be the best of the esculent algae. The name is supposed to be a corruption of Balder-locks. See *BALDER*.

Baden, THE GRAND-DUCHY OF, is situated in the south-western corner of the German empire between Alsace-Lorraine and Württemberg, and is separated from Switzerland by the Rhine. Its area is 5824 sq. m.—considerably less than that of Yorkshire.

Surface and Hydrography.—Physically, Baden falls into two divisions—the western plain, lying along the right bank of the Rhine, and the eastern highlands; the former occupying about a sixth of the whole duchy. Of the mountain districts, the Schwarzwald, or Black Forest (q.v.), is the most important, and attains a maximum altitude of 4903 feet. The Neckar highlands are lower, and north of the Neckar Valley the Odenwald begins. Southward rise the extensive plateaus of the German Jura. Being drained by the Rhine and the Danube, Baden belongs to the basins of two opposite seas; the sources of the Danube, however, drain only some 350 sq. m. From Basel to below Mannheim, the Rhine is the sole and the natural boundary. Its chief tributaries on the Baden side are the Neckar, the Murg, and the Elz. On the north-east the Baden territories are bounded by the Maine. Except a part of the Lake of Constance, Baden has no lake of importance.

Produce.—As the difference between the highest and lowest points of Baden amounts to something like 4500 feet, there is naturally a great variety of temperature. The Rhine Valley of Baden is one of the warmest and most fruitful districts, not only of Germany, but of Europe. Grain, vegetables of all

sorts, tobacco, hemp, rape, opium, &c. are grown, and a large quantity of wine is produced. The rearing of cattle is carried on to a large extent. Honey is also an important product.

Minerals.—The principal minerals are the products of the limestone quarries and of the clay and gravel pits, and gypsum, largely used for pavements. Coal, zinc, and manganese are found, and the production of salt and soda is important. Iron, lead, silver, and nickel were formerly wrought in the Black Forest, but the industry has become almost unprofitable, and now receives little attention. Baden is rich in mineral springs; as many as sixty are enumerated, and there are a great number of much-frequented watering-places, as Baden-Baden, Badenweiler, and others.

Manufactures, &c.—The manufactures of Baden include ribbons and cotton fabrics, paper, leather, rubber goods, chemicals, machinery, tobacco, chicory, sugar, beer, trinkets, mirrors, wooden clocks, and straw-plaiting; the last two are characteristic of the Black Forest, and known all over the world. Of clocks alone over 700,000 are made annually. The manufactures of jewelry in Pforzheim are the most important in Germany. The chief articles of export are wine and timber.

Population, Religion, Education.—The population of Baden in 1880 amounted to 1,570,196, and in 1885 it had increased to 1,600,839. The Roman Catholics in 1885 numbered 1,005,704. Protestants numbered 564,871; Dissenters and Mennonites, 3212; and Jews, 27,052. The school-system of Baden is excellent; it also possesses a Protestant university at Heidelberg and the Catholic university of Freiburg.

Government.—The sovereign is limited by a parliamentary constitution. The parliament consists of two chambers, the second chamber being made up of 63 representatives chosen for four years. The highest deliberative and executive body in the country is the council of state. The general debt of Baden in 1886 amounted to £522,000; that on the railways to £16,586,000. The military affairs of Baden are now exclusively regulated by the imperial power; the troops of Baden form the major part of the fourteenth corps d'armée of the empire. The effective war strength of the army is 45,000; peace, 15,000. Karlsruhe is the residence of the sovereign; the capitals of the four 'circles' are Constance, Freiburg, Karlsruhe, and Mannheim; and besides, there are four towns each with a population above 20,000.

History.—The earliest inhabitants of Baden known to history were the Alemanni. These fell under the dominion of the Franks, and the dukedom of the Alemanni was abolished in 748 by Pepin the Little. In the 11th century, a Duke Berthold built the castle of Zähringen in Breisgau, and a descendant of his second son took the title of Margrave of Baden, and became the ancestor of the still flourishing House of Baden. He died in 1130. The present capital, Karlsruhe, was built in 1715 by the then margrave, Charles III. It is to his grandson, Charles Frederick, who succeeded in 1746, that Baden owes considerable accessions of territory and political importance. By favouring the policy of Napoleon, and joining the Confederation of the Rhine, he doubled his possessions in extent and population, and acquired successively the dignity of elector and the title of grand-duke. In 1811 he was succeeded by his grandson, who, after the battle of Leipzig, seceded from the Confederation of the Rhine, and (1815) joined the German Confederation, in which Baden held the seventh rank.

The Grand-duke Charles granted (1818) the charter which forms the basis of the present constitution. Charles was succeeded in the same year

by his uncle Ludwig, who was inclined to absolutism, and who, dying childless (1830), was succeeded by his brother Leopold. The known liberal tendencies of this prince promised at first a new life to constitutional rule; but the tide of reaction soon seized the government, and a fluctuating contest between a reactionary cabinet and a growing opposition was carried on till 1846, when the constitutional Bekk was made minister of the interior, and liberalism thus placed at the helm. The ninth parliament met (December 1847) under the most friendly and promising auspices; when the French revolution (February 1848) suddenly called the radical party into the most violent activity. Not satisfied with a multitude of liberal measures passed by the legislature, the revolutionary leaders, Hecker and Struve, aimed at establishing a republic, and stirred up an insurrection. The troops having sided with the insurgents, the grand-duke fled, and a Constituent Assembly was called (May 1849). The duke had recourse to Prussian aid, and after several battles, was reinstated on his throne (July 1849); but the reactionary tendency was less marked in Baden than in most other German states. In 1859 a great conflict between the state authorities and the Catholic hierarchy ended in favour of the latter; two years later a definite settlement recognised the complete independence of the church, a privilege extended also to the Protestant Church of Baden. In 1864 liberal reforms reorganised the administrative and judicial systems of the country. In the conflict between Prussia and Austria in 1866, Baden took her place with the enemies of Prussia, and her troops fought in two ineffective battles against the Prussians. At the peace, Baden had to pay a heavy war indemnity, reorganise her army on the Prussian model, and in 1867, enter the North German Confederation. In 1870-71 the troops of Baden fought with distinction in the French campaign, and the grand-duchy became a part of the restored German empire. The Old Catholics have since been recognised, and elementary education has been secularised. The present grand-duke is Friedrich I. (b. 1826; suc. 1852). See GERMANY.

Baden, a town and fashionable watering-place in the Swiss canton of Aargau, on the left bank of the Limmat, 14 miles NW. of Zürich by rail. It has a pop. (1880) of 3692, and its sulphur-baths, which were known to the Romans as *Thermæ Helveticæ*, yearly attract some 20,000 visitors. Their temperature is as high as 117° F. Baden, from the 15th to the beginning of the 18th century, was the seat of the Swiss diet.

Baden-Baden, a town in the grand-duchy of Baden, situated in the pleasant valley of the Oos, at the edge of the Black Forest, 8 miles from the Rhine, and 23 SSW. of Karlsruhe by rail. Pop. (1885) 12,782; but its visitors during the season, which is at its height in July and August, are often four times the number of the settled population. It is chiefly celebrated for its medicinal springs, which were known in the time of the Romans, Baden-Baden claiming to have been founded by Hadrian in the 2d century A.D. Numerous Roman antiquities have been found in the neighbourhood, and are preserved in a museum here, and remains of a vapour-bath and dungeons of the same period were discovered in laying the foundations of the new castle. Its 13 hot springs have a temperature of 115° to 150° F., are impregnated with iron, magnesia, and lime, with sulphuric and carbonic acids, and are especially recommended in chronic cutaneous diseases, gout, rheumatism, and stomach complaints. The chief spring (*Ursprung*) discharges in 24 hours about 4200 cubic feet of water. The reputation of Baden-Baden as a

bad received an increase from the visit of a number of French emigrants in the end of the 18th century, and since 1804 the grand-ducal family have done everything possible to make the place more popular. So early as 1815 the annual guests numbered about 2500, and since then its fame as a fashionable resort has yearly assembled not only so many, but so good a class of guests from all parts of the world, that in wealth, gaiety, and luxury, Baden-Baden may vie with the capitals of Europe. The number of visitors reached in 1883 to over 50,000. The season lasts from May to September. Even the winter season, which was started in 1872, keeps quite a number of strangers there. The beauty of Baden-Baden has been largely due to its gaming-tables, once the most renowned in Europe, but closed with the rest of the licensed German gaming-houses in 1872; besides paying a rent of over £14,000, they used to devote a like sum yearly to the beautifying of the promenades and public gardens. To the tables was devoted part of the *Conversationshaus* (1824), now the principal resort of visitors, including magnificently decorated concert and ball rooms, and a restaurant. All around are carefully kept pleasure-grounds, leading on one side to the new *Trinkhalle* (1842), or pump-room, which contains some large frescoes by Götzenberger, representing legends of the Black Forest. The theatre (1862), the Friedrichsbad (1877), and the Villa Lembourg, occupied by Queen Victoria in 1872 and 1876, may also be noticed. The drives and walks around the town are beautiful. The picturesque ruins of the 'old castle' still crown the summit of the Schlossberg, and command a magnificent view of the Rhine valley from Spire to Strasburg. Lower down the hill, and directly overlooking the town, is the 'new castle' (1479), destroyed, like the old, by the French in 1689, but restored, and now the summer residence of the grand-duke. There is an English church in the town, built in 1863, and a Greek chapel for Russian visitors since 1882. See German works by Seeßels (1872), Biermann (1872), Heiligenthal (1877); and Schnars (10th ed. 1884); and *The Mineral Waters of Europe*, by Tichbourne and Prosser James (1883).

Baden bei Wien (i.e. 'Baden near Vienna'), a much-frequented watering-place of Austria, on the Schwechat, 16½ miles S. by W. of Vienna by rail. It was the *Aquæ Pannonicæ* of the Romans, and is still famous for its warm mineral springs, which are visited during the season by upwards of 10,000 persons. The springs are sulphurous, with much carbonic acid gas, have a temperature of 79° to 104° F., and are good for skin diseases, gout, and rheumatism. Fine bathing establishments were erected between 1848 and 1877. Pop. (1880) 9645.

Badenoch, a Highland district in the south-east part of Inverness-shire, 45 miles long by 19 broad, bounded by Lochaber, Athole, Braemar, and Moray, and traversed by the Spey. It is much covered with forest, and is chiefly composed of gneiss rock, with a little granite. It was a lordship, held from 1230 by the eldest branch of the great house of Comyn, on whose forfeiture in 1306 Bruce bestowed it on his nephew Randolph. In 1371 King Robert II. gave it to his son, 'the Wolf of Badenoch,' on the failure of whose descendants it reverted to the crown, which, in 1452, granted it to the Earl of Huntly.

Badge (etymology unknown, sometimes given from Lat. *bajulo*, 'I carry'; more probably connected with *badger*), a figure or emblem used, either with or without a motto, as the distinctive cognisance of a family. Family badges, which originated in the infancy of heraldry, and continued in high favour down to the 15th century or later, were sometimes taken from a

bearing in the family coat, and sometimes bore allusion to the owner's name, estate, or office. While the banner, shield, and jupon of the knight displayed his armorial coat, and the crest surmounted his helmet, the badge glittered on his standard and penoncelle, and on the sleeve, breast, or back of his retainer, and occasionally helped to decorate his armorial seal. Devices, otherwise analogous to badges, differed from them as belonging to individuals, not families. The *fleur-de-lis*, as the badge of the kings of France, dates as far back as the reign of Louis VII. (1137-1180). Of the English royal badges, which have varied much, a few may be enumerated. A star between the horns of a crescent appears on the great seals of Richard I., John, and Henry III., and a castle (allusive to his descent from the house of Castile) on that of Edward II. An ostrich feather was used by Edward III.; and the same cognisance was borne argent by the Black Prince, and ermine by John of Gaunt. None of the sovereigns of the house of Plantagenet were in the habit of using the *planta genista*, commonly known as the badge of that house; but a livery collar of broom pods with a white hart pendant appears in the portrait of Richard II. at Wilton. Of the famous rival cognisances of the houses of York and Lancaster, the red rose was first adopted by Henry IV. and the white by Edward IV. The Tudor sovereigns used the red and white roses variously united, per pale, quarterly, and one within the other. The thistle, as the badge of Scotland, seems to have been first used by James III.; and on the union of the crowns, the rose and thistle were used dimidiated and crowned. The royal badges of the United Kingdom as now in use (settled by sign-manual in 1801) are—a white rose within a red, crowned, for England; a thistle proper, crowned, for Scotland; a harp or, stringed argent, and a trefoil vert, for Ireland; and, on a mount vert, a dragon passant, wings expanded, and endorsed gules, for Wales. Among the best known badges of the English nobility are the crescent of the Percies, the buckle of the Pelhams, the bear and ragged staff of the Earls of Warwick, and certain intertwined cords known as knots, the forms of which have sometimes been suggested by the initial letter of the name or title of the bearer. In the Wake and

It has been the usage of the Highland clans to appropriate certain plants, chiefly native, as their badges, common heath being the badge of the Macdonalds, bell-heather of the Macdonalds, holly of the Mackenzies and Macleans, box of the Macintoshes and Macphersons, fern of the Chisholms, fir clubmoss or wild myrtle of the Campbells, &c.

The term badge is also applied to the distinctive decoration of an order of knighthood. Badges of this description are noticed in the separate articles relating to the different knightly orders; those of baronets in the article BARONET.

Marks of distinction used in party warfare, and devices adopted by clubs or associations, are sometimes in loose popular language called badges. Cockades are the subject of a separate article. See also DEVICE, CREST, HERALDRY.

Badger (*Meles*), a genus of carnivores of the *Mustelidæ* or Weasel and Otter family. The Skunks (*Mephites*), Sand-bears (*Arctonyx*), American Badgers (*Taxidea*), Ratels (*Mellivora*), &c., are closely related genera in the same sub-family as the Badger (*Melidæ*). Badgers, like the rest of the family to which they belong, are almost quite plantigrade—i.e. they walk on the whole

Badger (*Meles vulgaris*).

sole of the foot, and not merely on the fore part of it. The body is thus brought nearer to the ground than it otherwise would be from their length of limb. The lower jaw is locked into its socket in a very remarkable way, which explains their tenacious grip. The head is long, with a pointed muzzle; the tail short; the skin very thick, loose, and tough; the hair long. Both ears and eyes are small. The gait is slow, the habits nocturnal and solitary. There are five toes on each both of the fore and hind feet, and the feet are peculiarly adapted for digging and burrowing. A peculiar characteristic of the badgers is the possession of a bag beneath the tail, for the secretion of a peculiar substance, of a disagreeable odour, which is supposed to be of use in directing the sexes to each other in their solitary wanderings.—The Common Badger (*M. taxus* or *M. vulgaris*) is the only bear-like quadruped now found in the British Islands, and that only rarely. It is widely diffused over Europe and the middle parts of Asia. The colour is grayish brown, verging to red above and black beneath; the head white, with a longitudinal black band on each side; the body long but robust, in size about equal to that of a small fox, the hair coarse and reaching to the ground as the animal walks. The average length is 2 feet 6 inches, and the height at the shoulder 11 inches. It haunts the gloomy recesses of woods, or thick plantations on the sides of hills, and digs for itself 'a deep and well-formed domicile, consisting of more than one apartment, the single entrance to which is by a deep, oblique,

1, Wake and Ormond knot; 2, Lacy knot; 3, Bowen knot; 4, Heneage knot; 5, Dacre badge.

Ormond knot (fig. 1), it is not difficult to trace a *W* and two *O*s. The Bouchier knot, as seen on the tomb of Archbishop Bouchier at Canterbury, bears a resemblance to two *B*s, and the Stafford knot to two *S*s. The Lacy knot (fig. 2) contains within it a rebus on the four letters of the name 'Lacy.' As examples of the badges of two different families entwined by a knot and used by the descendants of both, are the badge of the Dacres (fig. 5), combining their own escallop-shell with the ragged staff of Neville; and that of Edward, Lord Hastings, uniting the garbe of the Peverells with the sickle of the Hungerfords.

and even tortuous excavation.' In such an excavation as this, the animal sleeps during the day and through the winter. It uses its nose in digging, and scrapes with the fore-paws, flinging the earth as far back as possible, and when the accumulation is considerable, pushing it away by means of the hind-feet. The habits of the badger are extremely cleanly. It is one of the most perfectly omnivorous of animals, in a wild state as well as in confinement; fruits, roots, beech-mast, eggs, young birds, small quadrupeds, frogs, snails, worms, and insects, equally constitute its natural food. For the sake of the larvae of wasps and wild bees, it even ventures to dig up their nests, its hide being impervious to their stings. It is often caught by digging, or by placing a sack in the mouth of its hole, when it is out at night. Dogs sent into the hole are often foiled by the earth which the animal throws back upon them, to block up their way, nor is it easy for a dog to contend with it, owing to the great strength of its legs and jaws. A barbarous sport, called badger-baiting, or *drawing the badger*, was formerly common, but has been prohibited by act of parliament since 1850. A badger kept in a barrel was assailed by dogs, and at last, yielding to superior numbers, was dragged out, upon which it was released, and allowed to go back to its den, to recover itself, and be baited again, which happened several times daily, when the badger was kept as an attraction to a public-house of the lowest sort. The verb *badger*, expressive of persevering annoyance by numerous assailants, was originally employed with reference to this practice. The flesh of the badger is said to be very agreeable, particularly when cured like hams. It is usually fat, like that of most sluggish heavy animals. In China it is much used for food. The badger is easily domesticated when taken young, and becomes very tame. In Scotland and the north of England, a badger is still called a *Brock*, its Anglo-Saxon name, preserved in the name of some places; in some parts of England it is termed a *Grey*. The Indian *Bhalú-soor* (i.e. Bear-pig), or *Sand-bear* (*Arctonyx collaris*), closely resembles the badger, but is taller, and has a more hog-like muzzle, and a longer tail. Its habits and its food are very similar, and when attacked, it likewise defends itself with great vigour. It is chiefly found in hilly districts.—The American Badger, or *Taxel* (*Taxidea americana*), is a distinct, more carnivorous genus, differing in dentition and in some features of the skull. It chiefly preys on small animals, such as marmots, which it pursues into their holes in the sandy plains near the Missouri and the Rocky Mountains. In its pursuit of the smaller quadrupeds upon which it feeds, it enlarges their burrows, and renders some parts of the plains dangerous to persons on horseback. Its prevailing colour is hoary gray in winter, yellowish brown in summer, and under parts generally yellowish white; a white stripe runs from the nose over the forehead to the neck. The hair becomes not only very long but woolly in winter.—The burrowing powers of this animal are extraordinary. It sometimes makes burrows 6 or 7 feet deep, running under ground to a length of 30 feet.

Badger Dog. See DACHSHUND.

Badghis, a region north of Herat, comprising the country between the Murghab and the Hari-rud rivers, as far northward as the edge of the desert. It lies just to the south of the boundary line between Afghanistan and the Russian territories, as defined in 1887.

Badí'a-y-Lablich, DOMINGO, an enterprising traveller, born at Barcelona in 1766. Early smitten with the love of travel and adventure, in 1801 he

crossed to Africa, disguised as a Mussulman, under the name Ali-Bei. From his youth he had been a devoted student of Arabic, and his knowledge of the manners and customs of the people was so intimate that he could escape detection, while to make his conformity complete, he had even circumcised himself. His tact and talents gained for him such esteem that he was invited to the court of the emperor of Morocco. After a two years' residence in Morocco, he set out on a pilgrimage to Mecca, and travelled through Barbary, Greece, Egypt, and Syria, meeting everywhere a kind reception. At the holy city of the Moslems he took his part duly in all the solemn rites, and has the distinction of being the first Christian that had visited it since the institution of Islam. In 1807 he returned to Spain, attached himself to King Joseph, and was appointed in 1812 Prefect of Cordova; but on the fall of Napoleon's power two years later, he was compelled to leave the country. He went to Paris, where in 1814 he published an account of his travels under the title *Voyage d'Ali-Bei en Afrique et en Asie*. His work was translated into most of the European languages. Four years after the publication, he set off on another journey to the East, but died in Syria on his way to Damascus, 30th August 1818.

Badminton, the seat of the Duke of Beaufort (q.v.), in the south of Gloucestershire, 7 miles E. of Yate Junction. It is a stately Palladian edifice of 1682, with a fine park. From it have been named a kind of claret cup, and a game, a predecessor of lawn tennis, played with a shuttlecock instead of a ball.

Badrinath, a peak of the main Himalayan range, Garhwal district, North-western Provinces, India, 22,901 feet above the sea. A shrine of Vishnu stands on one of its shoulders at a height of 10,400 feet, about 56 miles NE. of Srinagar. This temple overhangs a sacred tank, which is supplied from a thermal spring in the neighbourhood. As ablution in these waters is held to cleanse from all past sins, Badrinath is a grand resort of pilgrims, every year bringing large numbers; but every twelfth year, when a periodical festival is celebrated, collecting fully 50,000.

Baedeker, KARL, a German publisher, born in 1801 at Essen, where since 1797 his father had carried on the business of printer and bookseller. He himself started in business in 1827 at Coblenz, where he died, October 4, 1859. He is best and everywhere known as the originator of a series of admirable guidebooks. With Murray's 'Hand-books' for their pattern, the German works, in the course of successive editions, have been so improved and entirely rewritten, that they have come in most essentials to equal, and in some to surpass their models; and now the guides are published in the principal languages of Europe. The business was removed in 1872 to Leipzig, carried on under the son of the founder. The first guidebook published by Karl Baedeker was a small book on the Rhine, of which in 1839 he produced a third edition entirely rewritten by himself (21st. ed. 1881). Between that time and 1888, when an excellent guide to Great Britain was published, the word Baedeker has become almost a synonym for guidebook.

Bael, or BHEL. See ÆGLE.

Bañna, a Spanish town 25 miles SSE. of Cordova, with a trade in grain and oil. In the castle here, Pedro the Cruel murdered the Moorish king of Granada with all his train. Pop. (1878) 13,336.

Baer, KARL ERNST VON, a distinguished Russian naturalist, who contributed very largely

to the progress of natural science, especially of embryology, was born February 29, 1792, in Esthonia. During 1810-14 he studied medicine at the university of Dorpat, but in 1814 studied comparative anatomy in Würzburg. In 1817 he went to Königsberg, where, two years after, he was appointed professor of Zoology, and charged with the organisation of the zoological museum. In 1834 he was called to St Petersburg, and was soon known as one of the most active members of the Academy. In 1837 he visited Nova Zembla; and in 1851-56 he devoted much time and study to the fisheries on Lake Peipus, the Baltic, and the Caspian Sea, publishing a large work thereon, and suggesting many improved methods. He specially applied himself to embryology; and to his laborious investigations we owe most valuable discoveries in regard to the development of animal life. Beginning with his *Epistola de Ovi Mammalium et Hominis Genesi* (Leip. 1827), he still further elucidated this subject in a great work on development of animal life from its first germ (*Entwickelungs-geschichte*, 1828-27), and one on the development of fishes (1835). In 1864 the fiftieth year of his doctorate was celebrated by the Esthonian nobility, at whose expense a splendid volume was published, containing Baer's autobiography. He died November 28, 1876. His works are distinguished by lucidity as well as keen observation and brilliant speculation; they include, besides those above named, a work on two-bodied monsters. His *Eeden und Kleine Aufsätze* appeared in 1864-75; the *Beiträge zur Kenntniss des Russischen Reichs* (by him and Helmersen, in 26 vols.) in 1864-75.

Baeza, a handsome old town of Spain, in the province of Jaen, 9 miles from a station of its own name, this being 160 miles S. of Madrid. The *Baetia* of the Romans, and the seat of Moorish califs and kings, with 150,000 inhabitants, it never fairly recovered from its sack by the Castilians in 1228. Its principal buildings are the quondam university (1533) and the oratory of St Philip de Neri. Pop. (1878) 14,377.

Baffa. See PAPHOS.

Baffin, WILLIAM, navigator and discoverer, is believed to have been born in London about 1584; but the earliest known fact regarding him is that he sailed in 1612 as pilot of the *Patience* from Hull, on a voyage of discovery to Greenland. In 1613-14 he served in the Spitzbergen whale-fishery, and he wrote an account of this and his previous voyage. In 1615 he took service with a company as pilot of the *Discovery* in search of a North-west Passage, and made a careful examination of Hudson Strait; his recorded latitudes and notes of the tides are in remarkable agreement with those of a later date. In the following year, with Captain Bylot, he discovered, charted, and named Smith's Sound, and several others, and explored the large inlet now associated with his name. Later investigation has confirmed his descriptions. His latest voyages, 1616-21, were to the East. At the siege of Ormuz, which the English were helping the Shah of Persia to recover from the Portuguese, he was killed by a shot, 23d January 1622. See *Voyages of William Baffin, 1612-22*, edited by C. R. Markham (1880).

Baffin Bay, a gulf, or rather sea, on the NE. coast of North America, extending between Greenland and the great islands NE. of Hudson Bay (one of which is called Baffin Island), in 69° to 78° N. lat. It is about 800 miles long, with an average breadth of 280. The shores are for the most part lofty and precipitous, backed by ranges of snow-clad mountains. Baffin Bay communicates with the Atlantic Ocean by Davis Strait; and with the Arctic Ocean by Smith Sound on the north, and Lancaster Sound on

the west. Baffin Bay, discovered in 1562, was first explored in 1615 by William Baffin, pilot of an expedition commanded by Bylot. Whale and seal fishing are prosecuted to a large extent in Baffin Bay, which, on account of ice, is only navigable for some four months in summer.

Bagameyo, a village on the east coast of Equatorial Africa, opposite the island of Zanzibar. From this point caravans often start for the interior.

Bagnasse, also called Cane-straw or Cane-trash, is the refuse left after the expression of the saccharine matter from the cane in the manufacture of sugar. See SUGAR.

Bagatelle (Fr., 'a trifle'), a game somewhat resembling billiards. A bagatelle-board is usually about 7 feet long and 21 inches broad; it is of slate, and is lined with cloth and cushioned; and a game is played on it with nine small ivory balls and a cue or mace. The player's object is to put the balls down in nine numbered holes at the further semicircular end of the board. The game is as old at least as 1819.

Bagdad, the capital of the province of the same name in the SE. of Asiatic Turkey, is situated on both banks of the Tigris, about 500 miles from its mouth, in 33° 20' N. lat., and 44° 23' E. long., in a flat, treeless plain of considerable extent, which is dotted with the ruins of ancient buildings. The entire city is surrounded by a brick wall, 5 miles in circumference and 40 feet high, but in some places broken down, and by a deep dry ditch; the two parts are connected by a bridge of boats, 220 yards long, and the communication is guarded by a citadel. There are four gates, the finest of which, bearing date 1220, has remained closed since 1638. It has an extremely picturesque appearance from the outside, being encircled and interspersed with groves of date-trees, through which one may catch the gleam of domes and minarets; but it does not improve on closer inspection. The streets are narrow, crooked, unpaved, and dirty, full of ruts, and strewn with garbage, which, however, is for the most part removed by dogs, the only public scavengers in the East. The houses have, in general, no windows towards the front, and are built of old, yellowish-red brick; but their interior is often very gorgeously decorated. The vaulted ceilings, rich mouldings, inlaid mirrors, and massive gilding, bring back to the recollection of the traveller 'the golden prime of good Haroun Al-Raschid.' Bagdad contains upwards of 100 mosques, though barely 30 of them are in use; and a large general hospital has recently been erected. These, together with the khans, bazaars, baths, and the palace of the governor, are the only noticeable buildings in the city, whose public edifices, indeed, are meaner than those of any other oriental town of a like size. The domes and minarets, the earliest dating from 1235, are ornamented with glazed tiles and painting, in green and white.

The bazaars exhibit the produce of both Turkish and European markets; but commerce has greatly decreased since Persia began to trade with Europe by way of Trebizond on the north, and by the Persian Gulf on the south. Nevertheless, though no longer the chief emporium of merchandise between East and West Asia, Bagdad still carries on a considerable traffic with Aleppo and Damascus, and has manufactures of red and yellow leather, silks, and cotton stuffs. Of late years many European houses have settled agents in the town, and Britain, France, and Russia have also consuls there. Dates, wool, grain, and *timbac* (a substitute for tobacco) are exported, and a number of horses are sent into India. Of the population, variously estimated at from 60,000 to 180,000, the greatest part are Turks and Arabs;

the remainder are native Christians, Jews, Armenians, Hindus, Afghans, and Persians. In summer, the heat is oppressive, ranging from 75° at sunrise to 122° F.; rain does not fall on more than twenty or thirty days throughout the whole year; but when the snows melt on the Armenian hills, the Tigris becomes a majestic, and often a destructive river. In 1831 an inundation destroyed one-half of the town, and several thousand lives. Cholera visits it periodically; in 1831, 4000 people perished daily for several days from its ravages. In 1870-71 Bagdad also suffered severely from famine. Since 1836, British steamers have plied on the Tigris between Bagdad and Basra; and here is one of the chief stations of the Anglo-Indian telegraph.

Bagdad was generally believed to have been founded by the Abbaside calif Almansur, 764 A.D., but Rawlinson, in 1848, discovered below the normal river-level walls of brickwork, each brick bearing the name and titles of Nebuchadnezzar. In the 9th century it was greatly enlarged by Haroun Al-Raschid, who erected numerous edifices on the east side of the Tigris, and connected its two banks by a bridge of boats, and under his son, Al-Mamun, it became the great seat of Arabic learning and literature. A hundred years later, Bagdad was ravaged by the Turks. In 1277 the grandson of Genghis Khan, Hulaku, put an end to the old califate; but the descendants of this Tartar conqueror were expelled by Timur, who took the city in 1393. After several vicissitudes, it remained in the possession of a Turkoman chief, whose dynasty governed until 1477. In the beginning of the 16th century, Shah Ismael, the founder of the Saffide dynasty in Persia, made himself master of it; since which period it has repeatedly been a bone of contention between Turks and Persians. After a memorably obstinate siege, it was conquered by the sultan, Murad IV., in 1638. Nadir Shah vainly essayed to retake it in the 18th century, and ever since it has been under the sway of the Porte.

The province of Bagdad, lying between Arabia and Persia, comprises the greater portion of the basin of the Lower Euphrates and Tigris, and is estimated to have a population of 4,000,000. The part between the two rivers, including ancient Mesopotamia and Babylonia, though now mostly a barren wilderness, was in ancient times luxuriantly fertile, the seat of mighty empires, and inhabited by industrious populations. The inhabitants are composed of Turkomans, Armenians, Turks, Jews, Arabs, and Kurds; the last of which races are notorious for their open and audacious depredations. For a description of the cities which in ancient times adorned this region, see ASSYRIA, BABYLON, CTESIPHON, NINEVEH, SELEUCIA.

Baghot, WALTER, English economist and journalist, was born at Langport in Somersetshire, in 1826. He attended school at Bristol, and in 1842 went to University College, London, where he graduated in 1848; afterwards studied law, and was called to the bar in 1852, but joined his father in his business of banker and shipowner at Langport. In 1858 he married a daughter of the Right Hon. James Wilson, founder of the *Economist* newspaper; and from 1860 till 24th March 1877, when he died in his native town, he was the editor of that important journal. Baghot's literary activity began in 1851, when he was in Paris at the time of the *coup d'état*, and wrote seven letters to a London paper, justifying the policy of Napoleon. These letters were published after his death in the first volume of his *Literary Studies*. Besides some other works of minor importance, there appeared during his lifetime: *The English Constitution*, a book of great value, translated into several modern languages; *Physics and Politics*, a treatise published in the International Scientific Series, which

applied to the discussion of politics the theory of evolution; and *Lombard Street*, an able work on the money-market. Among his posthumous publications may be mentioned his *Literary Studies*, in 2 vols., and his *Economic Studies*, in 1 vol. Baghot was a vigorous and brilliant writer, and a thinker of great acuteness and suggestiveness. While adhering to the current English type of thought, both in politics and economics, he was thoroughly independent in the formation and expression of his views, and was readier than most of his contemporaries to give weight to the historical and evolutionary side of things. In particular he recognised the limitations of the Ricardian economics, and considered political economy as a science not of rigorous laws, but of tendencies.

Baggesen, JENS, a well-known Danish poet, but who also has a place in German literature, was born at Korsør, in the island of Zealand, February 15, 1764. While still a student at Copenhagen, he made a reputation as a poet by his lyrics and *Comic Tales* (1785). He made a lengthened tour through Germany, Switzerland, and France, and from this time German was to him a second mother-tongue. In 1811 he was appointed professor of Danish Language and Literature at Kiel; but three years after he removed to Copenhagen, where he became involved in an unseemly strife with Oehlenschläger, and in 1820 he left Denmark, never to return, for he died at Hamburg, October 3, 1826, whilst on his homeward way. His most important work is his idyllic epic, *Parthenais oder die Alpenreise* (1804), which contains single passages of great beauty. Baggesen possessed little lyrical genius, though many of the poems are admirable. He was strong in satire, and maintained a powerful polemic against the extravagances of the German romantic poets. The sphere in which he shone most conspicuously was the serio-comic. His so-called 'humorous epic' of *Adam and Eve*, published shortly after his death, is a singular mixture of humour, pathos, and levity. His style is excellent, and in this respect the Danish language owes much to him. His German works fill 5 vols. (1836); his Danish, 12 (new ed. 1845-48). See his *Life* by his son (4 vols. 1849-56); and Arentzen, *Baggesen og Oehlenschläger* (8 vols. Cop. 1870-78).

Baghal, BAGUL, or BHAGUL, one of the Punjab hill-states in North-west India, on the south or left bank of the Sutlej, with an area of 124 sq. m. Pop. (1881) 20,633.

Baghelkhand, the name of five native states, under the political superintendence of the governor-general's agent for Central India, lying to the south of the districts of Mirzapur and Allahabad. The total area is 11,324 sq. m.; pop. (1881) 1,512,595. The following are the states included in the agency, which up till 1871 was under Bundelkhand: (1) Rewah, in the east, by far the largest and most important, with a pop. of (1881) 1,305,124. It is rich in minerals and forests. The capital and residence of the political agent is Rewah, 131 miles SW. of Allahabad. Sutna is the chief railway station. (2) Nagode, on the eastern border of Rewah, is traversed by the East India Railway; the capital, of same name, is a British cantonment. Pop. (1881) 79,629. (3) Maihar, north of Jabalpur district; pop. 71,709. (4) Sohawal, north of Nagode; pop. 37,747. (5) Kothi; pop. 18,386.

Bagheria, or BAGARIA, a town of Sicily, 8 miles E. by S. of Palermo by rail. It is beautifully situated at the base of the isthmus which separates the Bay of Palermo from that of Termini, and is surrounded by groups of palatial villas of the Sicilian nobility. Pop. 12,650.

Baghistan. See BEHISTUN.

Bagimont's Roll, the name given to a valuation according to which the ecclesiastical benefices of Scotland were taxed from the end of the 13th century to the Reformation. It took its name from an Italian churchman, Boiamond (or Bajimont) of Vicci, a canon of the cathedral of Asti in Piedmont, who was sent by the pope to Scotland in 1274 to collect the tithe or tenth part of all the church livings, for a crusade. Hitherto, the Scotch clergy had been taxed according to a conventional valuation called the *Antiqua Taxatio*; but Boiamond set this aside. The clergy protested, and in a provincial council held at Perth in August 1275, they prevailed upon Boiamond, by promises and money, to return to Rome, there to entreat the pope to modify the subsidy. But the pope refused. Boiamond returned to Scotland to complete a valuation roll of its benefices; but he died before the tax itself was wholly collected. No complete copy of Bagimont's Roll in its original shape is now known to exist. A contemporary manuscript of so much of the Roll as applies to the archdeaconry of Lothian is preserved at Durham. A copy of Bagimont's Roll, as it appears to have existed in the reign of King James V. (1513-42), is preserved in the Advocates' Library at Edinburgh, in a hand of the beginning of the 17th century. It is full of inaccuracies; and it omits all livings of less than 40 marks a year. It was printed in *Archæologia*, vol. xvii. (1813). See J. Robertson's *Concilia Scotiæ* (Ban. Club), I. lxx.

Bagirmi, or BAGHERMI, a country in Central Africa, bounded on the W. by Bornu and a portion of Lake Chad, and with the powerful sultanate of Wadai to the NE. Its area is estimated at nearly 71,000 sq. m. The surface is flat, with a gentle rise towards the north—its general elevation being about 1000 feet above sea-level. It is traversed and watered by the Shari and its affluents. The soil yields durra and millet, which the natives barter for tobacco, pearls, and cowry shells. The total population is about a million and a half. Mohammedanism has been introduced among them, but gross superstitions still prevail. Dr Nachtigal describes the natives as of the Sonrhay type, of low stature, and not of pleasant features. Though they wear almost no clothing, they are in many respects semi-civilised, having a regular government in the capital Maseña, as well as a military system. The sultan of Wadai took the capital in 1871, reducing the sultan of Bagirmi to a more complete state of vassalage to him. The country was first visited by Dr Barth in 1852, afterwards by Dr Nachtigal in 1872. See vol. ii. of Nachtigal's *Sahara und Sudan* (Berlin, 1881).

Bagli'vi, GIORGIO, an illustrious Italian physician, born at Ragusa in September 1669. He studied at Salerno, Padua, and Bologna, and in 1692 went to Rome. Here, through the influence of his friend Malpighi, he was appointed professor of Anatomy at the college of La Sapienza, where he died in 1707. His work, *De Fibra Motrice*, is the foundation of the theory of medicine known as 'solidism,' which refers all diseases to changes in the solid parts of the body, and which claims that solids alone possess vital properties and can be the seat of pathological phenomena.

Bagnacavallo, an old town of Italy, still walled, and formerly noted for its strong castle, 11 miles W. of Ravenna. It contains a beautiful cathedral. Bartolommeo Ramenghi (1484-1542), the Bolognese painter, who is generally known as Il Bagnacavallo, was a native. Pop. 3843.

Bagna'ra, an Italian town, on the Gulf of Gioja, 16 miles NE. of Reggio. Excellent wine is produced in the neighbourhood. Pop. 6749.

Bagnères, the name of two towns in the Pyrenees, France, both well known as watering-places.—BAGNÈRES DE BIGORRE, on the Adour, in the department of Hautes Pyrénées, is situated 1820 feet above sea-level, at the base of Montalivet, and at the entrance to the romantic valley of Campan, 13 miles SE. of Tarbes by rail. Besides its extensive bathing-houses, it has a college, a theatre, a Pyrenean museum, a trades-hall; and contains a pop. of 7634. By the Romans it was known as *Vicus Aquensis Balneariæ* or *Aquæ Biggerorum*. It was destroyed by the Goths, but the fame of its waters survived, and is now so great that it is visited by about 20,000 strangers yearly. It has fourteen baths, the chief Les Thermes and Villa Théas, and above fifty springs (90° to 135° F.), recommended for catarrhal and nervous diseases. Woollens, linens, and *Barèges* (q.v.) are manufactured here.—BAGNÈRES DE LUCHON is situated in the department of Haute Garonne, in the beautiful valley of Luchon, 43 miles by road SE. of Bagnères de Bigorre, and 22 by rail S. of Montrejeau Junction. Its cold, tepid, and hot sulphurous waters (up to 130° F.) are recommended in rheumatism, gout, cutaneous diseases, and paralysis, and attract some 10,000 visitors annually. Pop. 3982.

Bagnes, the convict prisons of France. The name is from the Italian *bagno*, used originally of a bath in the Seraglio at Constantinople, and then apparently of a prison for slaves in it or adjoining it. The bagnes superseded in 1748 the old punishment of the Galleys (q.v.); but in 1852 they were themselves abolished, the imperial government substituting for them deportation to Guiana. The latest existing bagnes were those at Toulon, Brest, and Rochefort.

Bagni di Lucca, a bathing-place of Italy, 17 miles N. of Lucca. Pop. 900. It is situated in the fine valley of the river Lima, a branch of the Serchio, and has hot springs of various temperature from 96° to 136° F.

Bagno a Ripoli, an Italian village, 5 miles distant from Florence, containing baths, around which wealthy Florentines have built palaces and villas.

Bagno in Romagna, an Italian bathing-place, 35 miles E. by N. of Florence, on the right bank of the Savio, not far from its source. It has hot springs of temperature 108°-110° F., in which Natron (q.v.) is present. Pop. (1881) 1875.

Bagpipe, a wind-instrument, whose fixed characteristic has always been two or more reed-pipes attached to and sounded by a wind-chest or bag; which bag has in turn been supplied either by the lungs of the performer or a bellows. Some such instrument seems to have been generally known, at least throughout Europe and Asia, from a very early period. It was known to the Hebrews, Greeks, and Romans, and appears on their sculptures and coins—e.g. a coin of the Emperor Nero, who is said to have been a performer upon it. An ancient terra-cotta, excavated at Tarsus in Asia Minor, by Mr W. Burekhardt Barker, and supposed to date from about 200 B.C., represents a wind-chest with vertical rows of reed-pipes firmly fixed to the body of a performer. Sir William Ouseley met with it in Persia, where it is called 'reed-bag.' It is known in China and in some parts of India, and still continues in use in many countries of Europe, including Italy, the south of France, and Britain. In the 15th and 16th centuries it was common in Germany and England; carvings occur of it in churches at Boston, Great Yarmouth, and Hull; as also at Melrose. It is mentioned by Chaucer and Spenser, and several times by Shakespeare. Fuller in his *Worthies* describes the Lincolnshire bagpipe, and it

was played at Manton in that county not long before 1850. At what time it was introduced to Scotland is uncertain. The earliest extant specimen is probably an instrument bearing the date 1409, and in 1887 in the possession of Messrs Glen of Edinburgh. Except that it wants the large drone, which was introduced only at the beginning of the 18th century, it is in all respects similar to the Highland bagpipe of the present day.

Highland Bagpipe.

first been used in war by the Highlanders at the beginning of the 15th century, superseding the war-song of the bards. It has left its traces very distinctly in music, many popular national airs of different countries being evidently founded upon its drone bass and imperfect scale; while imitations of its effect are to be found in the works of many of the great modern composers. The Scotch Highland bagpipe is the only form of the instrument which is keeping its ground in Britain. It consists of an air-tight leathern bag, inflated by the breath of the player through a valved tube; and from this bag the sound proceeds, through three wooden pipes containing reeds of fixed tone called *drones*, which furnish a continuous bass, and another reeded pipe of conical bore with holes in it, which produces the melody, and is termed the *chanter* (see fig.). The drones have reeds somewhat like those of the organ, the two smaller producing a note in unison with the lowest A of the chanter, the larger one A an octave lower. The chanter has a double reed like that of the oboe or bassoon, and has seven holes in front for the fingers, and one behind for the thumb of the left hand. The compass is only nine notes, from G in the treble clef to A above it; these, however, do not form a diatonic scale, not being all accurately tuned to each other; the general effect of the music approximates to the key of A, but with the sevenths flat. This imperfection of scale, together with its somewhat harsh tone, is the cause of its unpleasant effect upon the accurately sensitive ears of those accustomed to music in the natural diatonic scale; but from the same cause results its semi-barbarous, exciting stimulus upon the Highlander in the battlefield. In playing, the drones are thrown over the left shoulder, the bag tucked under the left arm, the blowpipe taken in the lips, and the chanter held with the

fingers. In the Highlands, the 'skirl' of the bagpipe is equally esteemed in the 'lament' or at the merrymaking. The piper usually walks up and down while playing. The very abundant music for the instrument comprehends reels, strathspeys, marches, and pibrochs, a special peculiarity being the use of frequent and sometimes largely extended groups of ornamental passing notes, termed *warblers*. First-rate pipers have been known to introduce warblers of eleven notes between the last up beat, and the first down beat of a bar. Warblers of seven notes are common, and five usual, but their effect can only be understood from hearing the performance of a really good piper. That many of the older airs are written in the so-called pentatonic scale, omitting the fourth and seventh, is probably to be accounted for by the already-mentioned fact that several of the intervals on the instrument are not in perfect tune, and would naturally be avoided. Until recently bagpipe music was taught and even written in a notation of its own; but there are now several large collections of the music printed in ordinary notation. In music printed for the Highland pipes, no signatures are required, its nine notes being invariable. Each burgh in Scotland had formerly one or more pipers, and they formed also a regular part of the retinue of the Highland chieftains, the office being in both instances frequently hereditary. The most famous performers were the MacCrimmons, who for several generations were hereditary pipers to the MacLeods of MacLeod, and the last of whom died in 1822. Next to them the MacArthurs, pipers to the MacDonalds of the Isles, were held in esteem. Among burgh pipers the family of Hasties were hereditary pipers of Jedburgh for upwards of 300 years; the last of them died at the beginning of the 19th century. The clan piper still takes a prominent part in Highland festivities, funerals, and other celebrations; and a piper forms one of the royal establishment at Balmoral. Pipers are attached to all the Highland regiments (see *BAND, MILITARY*), and bagpipe performances and contests form a feature at Highland gatherings, at home or abroad, when prizes are offered to the best players of pibrochs, reels, &c.

The Scottish burgh pipers, above alluded to, are supposed to have played on a variety of bagpipe called the Lowland pipe. It was smaller than the Highland pipe, and played with a bellows instead of by the mouth, otherwise, however, being exactly similar in principle; as was also the old form of the

Irish Bagpipe.

Northumbrian pipe. A newer form of the latter is still played. It is also a bellows instrument, and has several keys on the chanter, giving it a chromatic scale. A peculiarity of its fingering is that only one hole is uncovered at a time, and the end of the chanter is closed. The Irish bagpipe is a much more complete instrument than the Highland, as its chanter possesses a nearly full chromatic

scale with a compass from D below the stave to D above the stave. The drones, which are all fixed on one stock, also possess keys, which are played with the wrist of the right hand, giving an harmonious bass which is very effective in the hands of a good player. Some of the drones are of great length, winding as many as three times the length of the apparent tube. The general arrangement may be seen from the figure. The player is seated, with one side of the bellows tied firmly to his body, the other to his right arm; the bag under the left arm, the drones resting over his leg, and the end of the chanter resting on a pad of leather on the knee, on which it is 'tipped' for the purpose of articulating many of the notes. From the softness of the reeds used, the Irish pipe is a very sweet instrument, but its use is rapidly dying out. The Italian bagpipe, familiar in Britain through the wandering *pifferari*, is a very rude instrument, consisting of a goat's skin with an enormous drone, on which the player performs by means of a mouth-tube; another player playing the melody on a separate chanter.

Bagrat'idæ, an Armenian royal dynasty, ruling from the 9th to the 11th century. See ARMENIA.

Bagration, PETER IVANOVICH, PRINCE, a distinguished Russian general, descended from the royal family of the Bagratidæ of Georgia and Armenia, was born in 1765. He entered the Russian service in 1783, and was trained under Suvorof. In 1788 he was engaged at the storming of Okzakof; fought in 1792 and 1794 against the Poles; in 1799, in Italy and Switzerland; and distinguished himself in the Austro-Russian war of 1805 against the French, especially in the sanguinary engagement of November 16 of that year, when, with only 6000 troops, he bravely stood during six hours against a force of 30,000 under Murat. Subsequently, he was engaged in the battles of Austerlitz, Eylau, and Friedland, and took a part in the Russian campaign against the Turks, especially in the siege of Silistria, 1809. In the campaign of 1812 he commanded the second Russian army of the west, and had the misfortune to fail in his attack on Davout near Mohilev; but succeeded in forming a junction with the main army at Smolensk. He was, however, mortally wounded in the battle of Borodino (q.v.), and died October 7, 1812.

Bagshot Sands, a series of strata overlying the London clay; the name being derived from Bagshot Heath, near Windlesham, Surrey, where they were first examined. See Eocene.

Bahamas, or LUCAYOS (Span. *Los Cayos*), a chain of British West Indian islands, stretching nearly 600 miles in a north-westerly direction from the neighbourhood of the north coast of Hayti, to that of the east coast of Florida. From Florida they are separated by the channel through which flows the Gulf Stream (q.v.); and from Cuba, by the Old Bahama Channel. These are the principal passages between the open ocean and the Gulf of Mexico. The chain extends in N. lat. from 21° 42' to 27° 34', and in W. long. from 72° 40' to 79° 5'; and it rests mainly on two shoals—the Great Bank to the south, and the Little Bank to the north. There are 20 larger islands, 653 islets or *cays*, and 2387 reefs. The chief members of the group, if reckoned from the NW., are these: Great Bahama, Abaco, Eleuthera, New Providence, Andros, Cat Island, San Salvador or Watling's Island, Exuma, Long Island, Crooked Island, Acklin, Mariguana, Inagua, Little Inagua. The Caicos (q.v.) and Turk's Island, which geographically belong to the Bahamas, have since 1848 been politically annexed to Jamaica.

The area is 5390 sq. m.; and in 1881 the popula-

tion was 43,521, of whom about 6500 are Europeans. Of coralline formation, the islands generally are of reef-like shape, long, narrow, and low, the highest hill not exceeding 250 feet. With very little appearance of soil, they derive considerable fertility from the tendency of the porous rock to retain moisture. Besides excellent pasturage, they yield Guinea-corn, maize, cotton, pine-apples, lemons, oranges, tamarinds, olives, pimento, cocoa-nuts, and a species of cinnamon. Sponges are largely found round the shores. Cotton cultivation received a great impulse during the American civil war. The sugar-cane, too, is grown more largely than formerly; but the salt manufacture has ceased to be remunerative. The temperature ranges from 57° to 113° F.; but in the winter the climate is so delightfully temperate as to be often prescribed in the United States for pulmonary complaints. The annual rainfall is from 43 to 45 inches, being heaviest from May to October, but pretty equally distributed over the other months. On 1st October 1866, and 8th September 1883, the Bahamas were visited by a furious and destructive cyclone.

The Bahamas were Columbus's earliest discovery (1492). But the precise spot of his first landing is still debated. Cat Island was generally believed to be the Guanahari or San Salvador of Columbus; but recent investigators transfer the honour to Watling's Island, situated a little farther to the east. The Bahamas, having been depopulated, but not again colonised by the Spaniards, were occupied by the English in 1629—to whom, after various vicissitudes of fortune in the wars with Spain and France, they were ultimately secured by the peace of Versailles (1763). Nassau, in New Providence, is the seat of government, and has recently been greatly improved both as town and port. During the American civil war, Nassau became the station for blockade-runners, and thence derived unexampled prosperity; the value of imports and exports rising from £234,029 and £157,350 in 1860, to £5,346,112 and £4,672,398 in 1864. They have greatly declined since; their present annual value, on a four years' average, being £192,710 and £136,310. So far, however, as agriculture is concerned, the impulse then received has been maintained by the Bahamas. Both Baptists and Wesleyans are nearly twice as numerous as members of the Church of England, which was disestablished in 1869; there are but few Presbyterians, and still fewer Catholics. The constitution consists of a governor, aided by an executive council of nine members, a legislative assembly of nine, and a representative assembly of twenty-nine. See Bacot's *Bahamas* (2d ed. Lond. 1871).

Bahar. See BEHAR.

Bahawalpur, capital of an Indian native state in political connection with the Punjab, lies near the left bank of the Sutlej, which here is crossed by the fine 'Empress Bridge' of the Indus Valley Railway. It has a circuit of four miles—part, however, of the inclosed space being occupied by groves of trees. Bahawalpur has manufactures of scarfs and turbans, silks, chintzes and other cottons, and the immediate neighbourhood is remarkably fertile in grain, sugar, indigo, tobacco, and butter. Pop. (1881) 13,635.—The surface of the state is remarkably level; but only about one-sixth, skirting the Sutlej and Indus, is capable of cultivation. From 1866 till 1879 the state was under British management, during the young Nawab's minority, and it prospered greatly, waste lands being cultivated, canals increased, the army organised, and the railway carried through a large section of the territory. The great majority of the inhabitants are Mohammedans. Area, 15,000 sq. m.; pop. (1881) 573,494.

Bahia, capital of the Brazilian province of the same name, next to Rio de Janeiro the largest city of the empire, on a range of hills stretching along the seashore. It is otherwise called São Salvador—the more usual term being taken from *Bahia de Todos os Santos*, or *Bay of All Saints*, on the east shore of which it is situated. The bay, which is one of the finest in America, is defended by forts, with the island of Itaparica (pop. 16,000) sheltering the entrance. It is built partly on the shore and partly on high ground; the lower town is dirty, with narrow paths. Street railways connect the city with its suburbs, and flights of steps and a hydraulic elevator aid the communication between the upper and lower town. Bahia has a university, an exchange, arsenal, and imperial dockyard, over sixty churches, and many public institutions; is the seat of an archbishop, who is primate of Brazil; and is the point of departure for a railway line to the interior. It is connected by submarine telegraph with Pernambuco, Para, and Rio. The value of imports and exports each exceeds £1,000,000 annually. The chief exports of Bahia are sugar, cotton, coffee, tobacco, rice, rum, dye-stuffs, fancy woods, cocoa-nuts, horns, hides, diamonds, and bullion; and it imports manufactured goods, provisions, flour, salt, iron, glass, and wines. Bahia is the oldest city in Brazil, and till 1763 was the capital of the colony. The bay was discovered by Amerigo Vespucci in 1503, and the city was founded by a Portuguese navigator named Correa in 1510. As a port, Bahia is unrivalled, and flags of all nations may be seen in the harbour. Unfortunately it is very unhealthy, and yellow fever and other epidemics find many victims here annually. Bahia contained, in 1883, 140,000 inhabitants, pretty equally divided between whites, blacks, and mulattoes.

BAHIA, a province of Brazil, about the middle of the coast, taking its name from its chief city. It extends in S. lat. from 10° to 16°, and in W. long. from 37° to 44°. Area 164,502 sq. m.; pop. (1883) 1,655,403. Its mineral deposits are in great measure lost for want of good roads, and have only been partially explored. The districts of Serra da Chapada and Serra da Sincorá have been famous for diamonds since 1844. The Brazil wood found in its primeval forests equals that of Pernambuco; its cotton, tobacco, and rice are all of superior quality; and the province exports more sugar than all the rest of Brazil. The interior contains lofty and dry sierras; but the maritime districts are fertile, being well watered by the Itapicuru, Contas, and other rivers, and form the most thickly populated part of Brazil. Besides the streams that flow through Bahia, the San Francisco, a vastly larger river, forms about half of the inland boundary, dividing this province from that of Pernambuco.

Bahia Honda, a harbour on the north coast of Cuba, 60 miles WSW. of Havana, protected by a fort. Pop. about 1500. Copper and coal are worked in the neighbourhood, and the sulphur-springs of Aguacate lie a short distance south.

Bahr, an Arabic word signifying a large body of water, is applied both to lakes and rivers.—*Bahr-el-Abiad* (the White River), and *Bahr-el-Azrak* (the Blue River), are the chief branches of the Nile (q.v.).—*Bahr-el-Ghazal* is the name of the upper branch of the Nile, constituted by the *Bahr-el-Arab* and many other tributaries, which flows sluggishly eastward to join the *Bahr-el-Jebel* and so form the *Bahr-el-Abiad*. The *Bahr-el-Ghazal* gives name to a province of what was the Egyptian Sudan, bravely held for years by the governor, Frank Lupton (see Lupton Bey's paper in the *Proc. Geog. Soc.* for 1884).—*Bahr-el-Yemen* is the Red

Sea (q.v.), and *Bahr-Lút* (Sea of Lot) the Dead Sea (q.v.).

Bähr, JOHANN CHRISTIAN FELIX, classical scholar, was born at Darmstadt in 1798, and educated at Heidelberg gymnasium and university, of which last he became ordinary professor of Classical Philology in 1823. His chief work is his *Geschichte der römischen Litteratur* (1828; 4th ed. 1868-70), which is noted for its clearness and comprehensiveness. Three supplements to this work deal with the Christian Poets and Historians of Rome (1836), the Christian-Roman Theology (1837), and the History of Roman Literature in the Carolingian Period (1840). His edition of Herodotus (2d ed. 1855-61) is also noteworthy. He died 27th November 1872.

Bahraich, a town of Oudh, India, near the old bed of the Gogra, 70 miles N.E. of Lucknow. It is an old town, with some local trade in piece goods and copper utensils. To the shrine of Masūd, a warrior and Mussulman saint, there is a great concourse of pilgrims annually in the month of May. Pop. (1881) 20,000. The area of the district of Bahraich is 2741 sq. m., and the population, 878,048.

Bahrdt, KARL FRIEDRICH, a German theologian and freethinker, was born in 1741 at Bischofswerda, in Saxony, and studied at Leipzig, where he became professor of Biblical Philology in 1766. Two years later he had to leave Leipzig for his immoral conduct. At Erfurt he was placed in the chair of Biblical Antiquities. Here he wrote two works whose heterodoxy involved him in controversies. In 1771 he was called to the chair of Theology at Giessen, and here also he preached with approbation for a few years, until he found it necessary to resign. Being inhibited from teaching by the government, he betook himself to Halle in 1779, and here he subsisted for ten years by keeping a public-house. Two political pamphlets brought him a year's imprisonment at Magdeburg, and gave him leisure to write the memoirs of his shifty life, published at Berlin in 1790. He died at Halle, April 23, 1792. His numerous theological writings are not of any value. See his *Life* by Leyser (2d ed. 1870).

Bahrein Islands, or **AVÄL ISLANDS**, a group of islands lying in the Persian Gulf. The most important of these is Bahrein (pop. 40,000), about 33 miles long and 10 broad. It is hilly in the centre, but the soil generally is fertile. Manama, the capital, has a good harbour. The Bahrein Islands are chiefly remarkable for their pearl-fisheries, which were known in ancient times, and which employ, during the season, from 1000 to 2000 boats, each manned with from 8 to 20 men. The annual value of the pearls is estimated at upwards of £300,000. The islands are inhabited by Arabs, and since 1861 have been under English protection. Pop. about 70,000.

Baiæ, a small town of antiquity, on the coast of Campania, 10 miles W. of Naples and opposite Puteoli, where the present castle of Baja stands. When the Roman empire was in its greatest splendour, the beauty of its situation, the fineness of the surrounding scenery, and the excellence of its mineral springs, made Baiæ such a favourite resort of the Roman nobles, that for want of space for their baths and villas they built out into the sea. Julius Cæsar, Piso, Pompey, Marius, Julia Mammæa, and others, had country-houses at Baiæ. Horace preferred Baiæ to all other places in the world. The ruins, still standing on the desolate coast, or visible beneath the clear waters of the sea, are now the only evidence of the former magnificence of Baiæ. The ruins of three supposed temples, as well as the remains of a few *thermæ*, or warm

baths, still attract the attention of archæologists. The harbour, one of the largest belonging to the Romans, is now small and poor. The surrounding country is covered with the ruins of Roman villas, sepulchral monuments, and other buildings.

Baikal (in Turkish, *Bei-kul*—i.e. 'rich lake') is, after the Caspian Sea and the Sea of Aral, the largest lake of Asia, with an area of some 13,500 sq. m. It is a fresh-water lake, and is situated in the south of Siberia, in the government of Irkutsk, in 51° 20' to 55° 30' N. lat., and 103° to 110° E. long., and somewhat resembles a sickle in shape. Its length is 330 miles, and its breadth 9½ to 40 miles; height above the sea, 1360 feet; mean depth 850 feet, but in some places as much as 4500 feet, more than 3000 feet below sea-level! The volume of water is calculated accordingly to be more than double that of Lake Michigan, which has a very much larger area. Its waters are a deep blue, and remarkably clear. The Baikal Mountains, a spur of the Altai, inclose the lake, which is fed by numerous streams, the chief of which are the Selenga and Bargusin. Its outlet is by the Lower Angara, a chief tributary of the Yenisei; but the river is inconsiderable in size compared with those which flow into the lake. It has several islands, the largest of which, Olkhon, has a length of 32 miles. There are numerous hot springs on its shores, and earthquakes are frequent. Formerly the lake seems to have been much more extensive; its level has fallen 20 feet within recent years (see ASIA). It is known that a subaqueous ridge divides Baikal into two great basins. The lake, which forms an important link in the chain of communication between Russia and China, has two commercial ports, and since 1846, steamboats have given a considerable impetus to its trade. The annual value of its fisheries is estimated at 200,000 roubles. Salmon and sturgeon are abundant, the former coming up the Yenisei from the Arctic Ocean, and large quantities of a fish resembling herring are also caught in it. It is one of the few lakes containing fresh-water seals, the capture of which employs most of the Russian settlers throughout the summer. A peculiar fish, called the golomyka (*Callionymus baicalensis*), which is almost one mass of fat, yielding admirable oil, was at one time found in immense numbers cast up on the beach after a storm, but it is now much scarcer. The surface of the lake is frozen from November to May, but the traffic is carried on over the ice. Besides the Russians in the town of Kultuk at the SW. end (with a harbour and lighthouse), the shores of Lake Baikal are also inhabited by tribes of the Buriats and Tunguses, who are now organised by the Russian government. See ASIA.

Baikie, WILLIAM BALFOUR, traveller, naturalist, and philologist, was born at Kirkwall, Orkney, 27th August 1825, and having studied medicine in Edinburgh, entered the royal navy as assistant-surgeon in 1848. He served in the Mediterranean, and from 1851 to 1854 acted as assistant-surgeon at Haslar Hospital. He was appointed surgeon and naturalist to the Niger expedition of 1854, and succeeding through the captain's death to the command of the *Pleiad*, in his first voyage he penetrated 250 miles higher than any previous traveller; but in his second expedition of 1857 the *Pleiad* was wrecked, and he was left by his fellow-explorers to continue his work alone. He founded a native settlement called Lukoja, at the junction of the Quorra and Benue, and within five years he had opened the navigation of the Niger, constructed roads, collected a native vocabulary, and translated parts of the Bible and Prayer-book into Hausa. He died while on leave of absence at Sierra Leone, 12th December

1864. The cathedral of St Magnus, Kirkwall, contains a monument to his memory. He published *List of Books and Manuscripts relating to Orkney* (Zetland, 1847); along with R. Heddle, *Historia Naturalis Orcadenis: Zoology* (Part I. 1848); and *Observations on the Hausa and Fulfude Languages* (1861).

Bail, as generally understood, means the security given that a person charged with a crime or offence shall appear for trial, he obtaining liberation from prison in the meantime. The laws of England and Scotland differ on this subject. In England the committing magistrate may in all cases, except treason, admit to bail, and in nearly all of those minor offences, which are in England called misdemeanours as distinguished from felonies, he must admit to bail. In cases of treason, the Queen's Bench Division may admit to bail. The magistrate must judge of the sufficiency of the person tendered as bail, and must fix at his discretion the amount of bail to be paid if the accused fails to appear. If the accused seek to leave the country, the bail may have him apprehended. In Scotland, the law was that in capital cases (i.e. according to the old law of punishment—serious theft being capital) the magistrate was not entitled to accept bail, but that in all other cases the accused had a right to bail, which by a statute of 1799 was fixed at certain amounts for the various classes of society; £300 for a burgess or householder, and £80 for an inferior person. This arrangement was, however, found to work badly, and by the Bail Act of 1888 the law was altered so that all crimes and offences except murder and treason became bailable; the fixing of the amount was given to the magistrate granting bail, an appeal to the High Court being allowed both to the applicant and to the public prosecutor. The application for bail must be disposed of within twenty-four hours, failing which the accused must be forthwith liberated. The right of the High Court and of the Lord Advocate to admit to bail was not affected by the act. When an accused person fails to appear, sentence of outlawry is pronounced, and the bail-bonds are forfeited. In civil procedure in England, bail is used also as the technical name of securities given for the release of an arrested ship, or the loosing of a foreign attachment, and in some other cases.

In the United States, the practice with regard to bail is very much the same as in England both in civil and criminal cases. Bail is admitted upon all arrests in criminal cases when this offence is not punishable with death; in cases of treason against the government it may be admitted in the discretion of the court. When the punishment is death, bail can be taken only by the supreme or circuit court, or by a judge of the district court of the United States. The bail on commercial contracts is not discharged by death; bail for appearance in court is discharged in that event. The enforcement of recognisance is generally similar to that under the common law.

Bailen, or BAYLEN, a town of Andalusia, Spain, 22 miles N. of Jaen. It has manufactures of glass, bricks, tiles, &c. Pop. 10,000. Here the Spaniards won their first and only victory over the French, 19th July 1808, when about 18,000 French soldiers laid down their arms.

Bailey, NATHAN or NATHANIEL, an early English lexicographer, whose work appeared in 1721 under the title, *An Universal Etymological English Dictionary*, to which a supplementary volume was added in 1727. In 1802 it had reached its thirtieth edition. An interleaved copy was the foundation of Johnson's more famous work. Lord Chatham is said to have read it through twice, and it

was one of the sources from which Chatterton drew his pseudo Old English words. In 1730 appeared the *Dictionary Britannicum*, by several hands, under the supervision of Bailey. This busy author wrote several other books, now of but slight importance. Of his life very little is known, save that he was a 'Seventh-day Baptist' and kept a boarding-school at Stepney, where he died, June 27, 1742. The English Dialect Society reprinted, in 1883, the 18th-century dialect words preserved in Bailey's Dictionary.

Bailey, PHILIP JAMES, poet, was born at Basford, Nottingham, 22d April 1816, and after studying at Glasgow University, was called to the English bar in 1840, but never practised. *Fastus*, the poem by which he is best known, was published in 1839, and reached an 11th edition in 1887, having in the course of these various editions received a large amount of new matter. It attracted considerable notice in England, and in America was hailed with a perfect tornado of applause. Before the enthusiasm had cooled, its author was in certain quarters mentioned in the same breath with Shakespeare, Milton, and Goethe. And by so great a poet as Rossetti it was, says his brother, under date 1843 'enormously relished, read again and yet again.' In 1850 appeared the *Angel World*, possessing on a reduced scale all the faults and beauties of the former work, with which it is now incorporated. Subsequent writings have been the *Mystic*, the *Age*, and the *Universal Hymn* (1867).

Bailey, SAMUEL, an industrious writer on political and mental philosophy, was born in 1791 in Sheffield, where afterwards he became a banker. He twice contested his native city as a 'philosophical radical' without success, and died there, after a remarkably busy but unusually quiet and uneventful life, January 18, 1870, leaving £80,000 as a bequest to the town. His first work was a really striking volume of *Essays on the Formation and Publication of Opinions* (1821), in which he ably defended the proposition that a man's opinions are independent of his will. His *Essays on the Pursuit of Truth and on the Progress of Knowledge* (1829) are only less valuable. His many controversial books on questions of political economy are already almost forgotten, though these, as well as his pamphlets and treatises on political representation, primogeniture, and the like, are characterised alike by terse exposition and vigorous style. Not less interesting but of less value, because to some extent the fruit of insufficient knowledge, are his *Review of Berkeley's Theory of Vision* (1842), *Theory of Reasoning* (1851), and *Letters on the Philosophy of the Human Mind* (1855-63). The third series of the last contains an able defence of utilitarianism, in which the author avows himself a thorough determinist. His conjectural emendations of the text of Shakespeare, published 1862-66, are of little value.

Bailey (probably derived from the middle Lat. *ballium*, frequently confused with *baillie*; 'the jurisdiction of a *baillie* or *bailiff*'), the whole space inclosed within the external walls of a castle, with the exception of that covered by the keep. This space was variously disposed of, and, of course, differed greatly in extent. Sometimes it consisted of several courts, which were divided from each other by embattled walls, so as to form a series of fortifications. When these courts were two in number, they were known as the outer and inner bailey. The entrance to the bailey was generally by a drawbridge over the ditch, and through a strong machicolated and embattled gate. It was often of great extent, containing the barracks for the soldiers, lodgings for workmen and artificers,

magazines, wells, chapels, and sometimes even a monastery. The word has survived in some proper names, as the *Old Bailey*, the seat of the Central Criminal Court in London, so called from the ancient *bailey* or *ballium* of the city wall between Ludgate and Newgate, within which it was situated. From the supposed license of vituperation supposed to characterise its proceedings, the well-known phrase 'Old Bailey style' has arisen. In Durham, also, the *bailey* is now a street, with the old name retained. The term is also applied to the outer wall or first line of defence, as well as generally to any of the circuits of walls which surrounded the keep.

Baillie, a Scottish term, with several legal applications, but originally a mere doublet of *bailiff*. It popularly signifies a superior officer or magistrate of a municipal corporation in Scotland, with judicial and administrative authority within the city or burgh. The civil and criminal jurisdiction of the Burgh Court, however, is not extensive. In royal burghs, the office is in some respects analogous to that of Alderman in England. The chief-magistrate of a Scots corporation, called the *Provost* (q.v.), and often one or more of the *baillies*, are, in virtue of their office, in the commission of the peace; and *baillies* are exempted from serving on juries. There are also *Baillies of Regality* and *Barony*, who are appointed by the *Superior* or over-lord of the Manor (q.v.), with limited powers fixed by the Heritable Jurisdications Act, 1747. There were also *baillies* of the four bailleries—viz. Carrick, Kyle Stewart, Cunningham, and Lauderdale. There is a *baillie* for the Sanctuary or Abbey of Holyrood, appointed by the Duke of Hamilton as hereditary keeper, and having jurisdiction within the precincts (see *SANCTUARY*). The word *Baillie* was also formerly a term in the practice of Scots conveyancing, and signified an officer who represented the seller, and who, as such, gave *seisin* or *Sasine* (q.v.), or delivery of the lands sold to the buyer or his attorney, the sheriff being *baillie* in crown land; but by the changes and simplifications effected by recent legislation, the office of *baillie* in this sense has been abolished.

Bailiff (Scotch *baillie*, Fr. *bailli*, Ital. *balio*; all from late Lat. *bajulivus*, an adj. from *bajulus*, 'a carrier,' then 'a manager'), an officer with public authority in a certain district. In England it was applied formerly to the king's officers generally, and it is still the formal title of the chief-magistrate of certain towns, as the 'Bailiff of Dover Castle.' The name *bajulos* was given at the Greek imperial court in Constantinople to the chief tutor of the imperial children, afterwards to the Venetian superintendent of the foreign merchants there, and in the form *Balio* to the Venetian ambassadors themselves. The title *Ballivus* was introduced by the Knights of St John into the south and west of Europe, as the eight members of their chapter were called *Ballivi conventuales*. In England the name was introduced after the conquest, and applied loosely to several officials; thus the sheriff was spoken of as the 'king's bailiff,' his shrievalty as his 'bailiwick.' Later, the word became applied to elective functionaries, but gradually to definite offices, as the presiding magistrate of a town—the English reeve, but unlike that officer, nominated by the over-lord instead of the citizens—as the bailiff of Beverley, by the Archbishop of York. By the end of the 13th century, the mayor had supplanted the bailiff almost everywhere.

BAILIFF, in English law, is a legal officer, and may be described as the keeper, protector, or superintendent of some duty or charge legally imposed on him. As officers of the law, bailiffs put in force

arresting process, and they perform other duties within the county or bailiwick required of them by the sheriff, who is their immediate official superior. In this sense bailiffs are either *bailiffs of hundreds* or *bound bailiffs*. The duty of the former is to collect fines, summon juries, attend the judges and justices at the assizes and quarter-sessions, and execute writs and processes in the several hundreds. *Bound bailiffs*, again, are officers usually joined by the sheriffs with the bailiffs of hundreds, and employed on account of their adroitness and dexterity. They are called bound bailiffs because, the sheriff being civilly responsible for their official misdemeanours, they are annually bound in an obligation, with sureties, for the due execution of their office. There are also *special bailiffs*, who are officers appointed by the sheriff on the application of the party suing out the process to be executed; and whenever a party thus chooses his own officers, he is considered to discharge the sheriff from all responsibility for what is done by him. There is, besides, another exceptional class of bailiffs, called bailiffs of *liberties*, honours, manors, and other lordships and franchises, whose appointments, duties, and responsibilities are regulated by the 7 Vict. chap. 19. The *high bailiff* of a county court is a permanent officer under whose directions the process of the court is executed by sub-bailiffs. The office of high bailiff is usually combined with that of the registrar.

The sheriff himself is the *Queen's bailiff*, and, as such, it is his business to preserve the rights of the crown within his bailiwick. He must seize to the sovereign's use all lands devolved to the crown by attainder or escheat; must levy all fines and forfeitures; and must seize and keep all Waifs (q.v.), wrecks, estrays, and the like, unless they be granted to some subject.

In the United States, the term bailiff is seldom used except sometimes to designate a sheriff's deputy or constable, or a party liable to account to another for the rents and profits of real estate; as in some cases a tenant in common who receives more than his share. The duties of a bailiff are performed in America by a deputy-sheriff, constable, or tipstaff, who are officers acting under the orders of the sheriff or magistrate, or under the immediate supervision of the court.

Bailiwick legally means the county or district within which the sheriff, as bailiff of the king, may exercise jurisdiction. It is often applied by English writers to foreign towns or districts under a *vogt* or *bailli*.

Bailleur, a town in the French department of the Nord, 19 miles NW. of Lille. It has manufactures of beer, leather, lace, linen, and soap, and a brisk trade in corn and cheese. The Bailor family hence derived its name. Pop. 8180.

Baillie, LADY GRIZEL, born in 1665, was the daughter of the Scottish patriot, Sir Patrick Hume, afterwards first Earl of Marchmont, and in 1684 supplied him with food during his concealment in the vault beneath Polwarth church. She shared her parent's exile at Utrecht (1686-88), and in 1692 married the son of Baillie of Jerviswood. He died in 1738, and she on 6th December 1746. She is remembered by her songs, the best of which is, 'And werena my heart licht I wad dee'; and also by *Memoirs of her* (1822), by her daughter, Lady Grizel Murray of Stanhope (1693-1759).

Baillie, JOANNA, poetess, was born in Bothwell manse, in Lanarkshire, 11th September 1762. Her father, a Presbyterian minister, in 1776 became professor of Divinity in Glasgow; her mother was the sister of William and John Hunter. She received a superior education, and soon began to manifest those talents which subsequently excited

the admiration of the public. Her career was a singularly happy one, but devoid of all striking incident. In 1784 she went to reside in London, where her brother, Matthew Baillie, had established himself as a physician. In 1806 she and her sister took a house for themselves at Hampstead, and here she remained till her death, which occurred on the 23d of February 1851, when she had attained the venerable age of 88. Agnes, her sister, survived till 1861, being then a hundred years old. No authoress ever enjoyed a larger share than Joanna Baillie of the esteem and affection of her literary contemporaries. All vied in showing her a courteous respect, and even America sent its votaries to her little shrine at Hampstead. Her greatest achievement is undoubtedly the nine *Plays on the Passions* (1798-1836), which, though erroneous in conception, are full of noble and impressive poetry, and often characterised by intense dramatic power. The principle upon which Miss Baillie proceeded in the construction of these plays, was, like Marlowe and George Meredith, to take a single passion as the subject of a work, and to exhibit its influence on an individual supposed to be actuated by nothing else. In spite of this method of treatment, there are scenes, in her tragedies especially, where the interest of the reader is intensely excited by the great art shown in the minute delineation of a particular passion, and where he is forced to forget the artificial theory of the author. The most popular as well as the most powerful of her works is the tragedy of *De Montfort*. It was brought out at Drury Lane in 1800, Kemble and Mrs Siddons taking the leading parts. Her *Family Legend*, produced at Edinburgh under Scott's auspices in 1810, was a great success. Many of Miss Baillie's minor pieces are very sweet, simple, and beautiful; and are marked by a sprightly grace of versification, and a playful serenity of spirit, which pleasantly remind one of the author's personal character. She was under the middle size, but not diminutive; her form was slender, and her countenance showed high talent, worth, and decision. See Miss Thackeray's *Book of Sibyls* (1883).

Baillie, MATTHEW, anatomist, brother of the above, was born in Shotts manse in 1761. His mother was a sister of the two celebrated anatomists, William and John Hunter; and Matthew, after seven years at Glasgow and Oxford (1773-80), studied anatomy under his uncle William, with such success, that in 1783 he was found qualified to succeed to his practice and lectureship. Working often sixteen hours a day, he made a very large income—one year, £10,000—so that he purchased the estate of Duntisborne in Gloucestershire, and at his death there, on 23d September 1823, left a fortune besides of £80,000. His works, with a *Life* by Wardrop, appeared in 2 vols. in 1825. The most important is on *Morbid Anatomy*, published in 1795.

Baillie, ROBERT, Presbyterian divine, was born at Glasgow in 1599, and educated at the university of that city. In 1622 he received episcopal ordination, and was shortly after presented to the parish church of Kilwinning. In 1637 he refused to preach in favour of Laud's service-book; and in 1638 he sat in that famous General Assembly which met in Glasgow to protest against the thrusting of Episcopacy on an unwilling people, but conducted himself with greater prudence and temperance than was quite agreeable to his excited brethren. However, he soon threw himself eagerly into the national cause, and served as a chaplain in the Covenanting army at Duns Law (1639). In 1640 he was selected by the Scottish leaders to go to London, with other commissioners, and draw up charges against Archbishop Laud. On his return to Scotland in 1642,

he was appointed joint-professor of Divinity at Glasgow, along with Mr David Dickson. In 1643 he was again sent to London as a delegate to the Westminster Assembly of Divines, where he conducted himself in an unobtrusive manner, but cordially concurred in the doctrines which were drawn up. It is curious to notice that, though he had himself experienced the injustice of intolerance, he yet, like almost every other theologian of his age, vehemently discarded the principle of toleration, and asserted the divine right of Presbytery with no less emphasis than Laud did that of Episcopacy. In 1649 he was chosen by the church to proceed to Holland, and to invite Charles II. to accept the Covenant and crown of Scotland. He performed his mission skilfully; and, after the Restoration, through Lauderdale's influence, he was made Principal of Glasgow University. He died July 1692. His pamphlets and larger works, fourteen in number, are well-nigh forgotten; but his *Letters and Journals*, edited by David Laing for the Bannatyne Club (3 vols. 1841-42), are a valuable contribution to our knowledge of the times.

Baillie, ROBERT, of Jerviswood, the 'Scottish Sidney,' was a native of Lanarkshire, who first came into notice in 1676 through his rescue of a brother-in-law, the Rev. Mr Kirkton, from the clutches of Archbishop Sharp's principal informer. For this he was fined 6000 merks (£318), and, refusing to pay, was sent to prison; but so strong was the indignation of the Scottish gentry, that he was released at the end of four months, on payment of half the fine. In 1683 he took a prominent part in a scheme of emigration to South Carolina, as he saw no other refuge from the degrading tyranny of the government. About the same time, however, he entered into correspondence with the heads of Monmouth's supporters in London, Russell and Sidney, and subsequently repaired there to concert measures for securing adequate reforms. On the discovery of the Ryehouse Plot, he was arrested and sent down to Scotland. Accused of conspiring against the king's life, and of hostility to monarchical government, he was tried at Edinburgh, and condemned to death upon evidence at once insignificant and illegal. His bearing, both on his trial and during his imprisonment, was such that his cousin, Bishop Burnet, declared 'it looked like a reviving of the spirit of the noblest of the old Greeks or Romans, or rather of the primitive Christians and martyrs.' The barbarous sentence for high treason was carried into execution on the very day that it was passed, 24th December 1684.

Bailly, JEAN SYLVAIN, a famous French astronomer, President of the National Assembly of 1789, and Mayor of Paris, was born in that city, September 15, 1736. From art he turned aside to literature, but was fortunately induced by Lacaille to study astronomy, which proved to be the true sphere of his genius. He was early admitted to the Académie des Sciences, and he justified his honours by a succession of learned and elegantly written treatises on astronomical subjects, which culminated with his great *Histoire de l'Astronomie* (5 vols. 1775-87). Elected to the Académie Française, and next year to the Académie des Inscriptions, he was thus a member of the three academies at once, an honour that had fallen to no one before him save Fontenelle. The revolution interrupted his peaceful studies. Elected President of the National Assembly, June 17, 1789, and Mayor of Paris on the 15th of July, he conducted himself in these capacities with great integrity and purity of purpose; but at last lost his popularity by allowing the National Guard to fire on the masses who were assembled in the Champ de Mars, on the 17th of July 1791, to demand the dethronement of the

king. He now threw up his mayoralty, withdrew altogether from public affairs, and went to live first at Nantes, and afterwards with his friend Laplace at Melun. Here he was seized by the Jacobin soldiery, and brought to Paris, where he was accused of being a royalist conspirator, condemned and executed with the usual Jacobin preliminary of savage insult, November 11, 1793. From his papers were published his *Essai sur l'Origine des Fables et des Religions Anciennes* (2 vols. 1799), and his *Mémoires d'un Témoin de la Révolution* (3 vols. 1804). See Nourrisson, *Trois Révolutionnaires: Turgot, Necker, Bailly* (1885).

Bailment, in English law, means the delivery of goods in trust for some special purpose, on a contract, express or implied, to conform to the purpose of the trust. Deposits, pledges, or pawns, contracts for hiring goods, and gratuitous loans, are all varieties of bailment. In the United States the same definition applies. Practically, bailments are of three kinds: (1) for the benefit of the bailor or his representative; (2) for the benefit of the bailee or his representative; (3) for the benefit of both parties. In the first case, as when a person receives the goods of another to keep without recompense, he is responsible only for gross neglect; in the second, he is responsible for the slightest neglect; in the third case, the bailee is bound only to ordinary care and diligence. Bailees, such as warehousemen, innkeepers, and common carriers, have a lien on the property bailed for their charges.

Baily, EDWARD HODGES, sculptor, was born at Bristol, 10th March 1788. Two Homeric studies which he had executed were praised by Flaxman; and in 1807 he went to London, saw Flaxman, and entered his studio. He won several medals; but his 'Eve at the Fountain' (1818) first established his reputation. George IV. employed him, along with other artists, to execute the sculpture in front of Buckingham Palace, the figures on the Marble Arch, and the 'Triumph of Britannia.' Besides these, Baily executed a great number of busts and statues—Wellington, Byron, Telford, Earl Grey, and Sir Astley Cooper. The statue of Nelson, in Trafalgar Square, is likewise his, as also those of Charles James Fox and Lord Mansfield in St Stephen's Hall, Westminster. His 'Eve listening to the Voice,' 'Sleeping Nymph,' 'Girl preparing for the Bath,' and 'The Graces Seated,' are among his finest efforts. He died 22d May 1867.

Baily, FRANCIS, astronomer, was born at Newbury, Berks, 28th April 1774. An apprenticeship in a London mercantile house was followed by a few years of roving, but at the age of 25 he settled down as a stockbroker in London. In financial business he showed great capacity, and he gradually acquired a large fortune. Meantime he published a series of excellent books on questions involved in banking and assurance. At 51 he retired from business to devote himself entirely to astronomy. Scientific honours were soon showered upon him both from home and abroad. Among the chief of the services rendered to his chosen subject through his unwearied industry, were his share in the foundation of the Astronomical Society, and in the improvement of the *Nautical Almanac*, his laborious repetition of Cavendish's experiment to measure the density of the earth (see EARTH), and the production of the Astronomical Society's Star-catalogue. The latter, says his biographer, Sir J. Herschel, 'put the astronomical world in possession of a power which may be said, without exaggeration, to have changed the face of sidereal astronomy.' Baily's writings, ninety-one in number, included a *Life of Flamsteed* (1835), but

mostly appeared in the *Astronomical Society's Memoirs*. He died in London, 30th August 1844.

Baily's Beads, the name given to a phenomenon in connection with eclipses of the sun, first fully described by Francis Baily. Just before the beginning and after the end of the obscuration by the moon of the sun's disc, the thin crescent-shaped unobscured portion of the sun seems usually to become suddenly discontinuous, and looks like a belt of bright points, varying in size and separated by dark spaces. The resulting appearance has been compared to a string of beads. The phenomenon is an effect of irradiation and the inequalities of the moon's edge. To irradiation it is also due that, by defect of the retina of the eye, bright objects seen on a dark ground seem larger than they really are.

Bain, ALEXANDER, writer on mental philosophy, was born at Aberdeen in 1818. Educated at the university of his native city, he lectured there as deputy-professor for a few years, afterwards taught Natural Philosophy at the Andersonian University, Glasgow, filled the office of assistant-secretary to the Metropolitan Sanitary Committee and the Board of Health, examined in mental philosophy for the university of London and the Indian Civil Service, and was appointed in 1860 to the chair of Logic in Aberdeen. He resigned in 1881, and the same year was elected Rector of his university. In 1859 he was made LL.D. by the Edinburgh University. Bain's chief works are *The Senses and the Intellect* (1855), and *The Emotions and the Will* (1859), completing a systematic exposition of the phenomena of the human mind. Other books are *Mental and Moral Science, a Compendium of Psychology and Ethics* (1868); *Logic, Deductive and Inductive* (1870); *The Relation of Mind and Body* (1873); *Education as a Science* (1879). He wrote also a biography of James Mill (1881), as well as a criticism of John Stuart Mill (1882), besides several handbooks of English grammar; he assisted in editing Grote's *Aristotle*, and edited Grote's *Minor Works*. In philosophy, Bain is a conspicuous representative of the empirical or experimental school, in opposition to the *a priori*, or transcendental. His psychology is based on physiology, after the manner of Hartley's; but instead of considering the human organism as capable only of receiving impressions and of acting in response thereto, he finds in it a power of originating active impulses (Spontaneity), and thus obviates many of the defects alleged by *a priori* philosophers to inhere in the system of sensationalism, as hitherto exhibited. His two chief works were pronounced by J. S. Mill to be the most careful, the most complete, and the most genuinely analytical exposition of the human mind which *a posteriori* psychology had produced. See ASSOCIATION OF IDEAS.

Baini, GIUSEPPE, musician, was born at Rome in 1775, and was director of the pope's choir from 1814 till his death in 1844. The severe gravity and profound science of his compositions contrasted strongly with the careless style and shallow dilettanteism of most of his contemporaries; but less by his compositions than by his historical researches did Baini secure for himself a prominent place in musical literature. His principal work is his *Life of Palestrina* (1828).

Bairaktar (more correctly, Bairak-dar, signifying 'standard-bearer') is the title of the energetic Grand-vizier Mustapha. Born in 1755, of poor parents, he entered the military service at an early age, and soon distinguished himself by his valour. When he was pasha of Rustchuk in 1806, he fought with some success against the Russians, and after the revolt of the janissaries in 1807, by

which Selim III. (q.v.) was deposed from the throne in favour of Mustapha IV., Bairaktar marched his troops to Constantinople, where they found the dead body of Selim lying in the first court of the seraglio. Bairaktar executed all those who had had any share in the murder, deposed Mustapha IV., and proclaimed the brother of this prince, Mahmoud II., sultan on the 28th July 1808. Bairaktar was now appointed grand-vizier, and endeavoured to carry out Selim's reforms, and to strengthen the regular army. His chief object was the annihilation of the janissaries; but, favoured by the fanatical people, these praetorians rebelled, and, with the support of the fleet, attacked the seraglio on the 15th November 1808, and demanded the restoration of Mustapha IV. Bairaktar defended himself bravely; but when he saw that the flames threatened to destroy the palace, and that he was in danger of falling alive into his enemies' hands, he strangled Mustapha, threw his head to the besiegers, and then blew himself up.

Bairam, the Persian and Turkish name for a Mohammedan festival somewhat analogous to Easter. It commences immediately after the fast of Ramadan, or Ramazan, which corresponds in its abstinence to Lent. Being one of the two great feasts of the Moslems, it is looked forward to with great interest, the zest being enhanced by the previous abstinence. Properly, it should terminate in one day, but the festivities are generally protracted over three days. Seventy days after, the Moslems celebrate the second Bairam ('the festival of the sacrifices'), instituted in commemoration of the offering up of Isaac by Abraham, and on which all the faithful of Islam must sacrifice victims. The second Bairam usually lasts four days. The Mohammedan year being the lunar one of 354 days, in the course of thirty-three years the festivals run through all the seasons. In 1887 the first Bairam fell on the 23d June.

Baird, SIR DAVID, Bart., British general, was born 6th December 1757, at Newbyth, Haddingtonshire. He entered the service in 1772, and in 1779 sailed to India as captain in a Highland regiment. He was soon in the midst of a sanguinary war. In July 1780, Hyder Ali burst into the Carnatic at the head of 100,000 men, disciplined and commanded by French officers. A portion of the English army fell into an ambuscade and was cut to pieces. Among the few who remained alive to be taken prisoners was Baird. He was thrown into a dungeon at Seringapatam, where he endured a captivity of nearly four years. In March 1784 he was released, and after a two years' visit to England (1789-91), he took part in several important sieges, attacks, and skirmishes; till in 1799, now a major-general, he memorably signalled himself at the victorious assault of Seringapatam. He led the storming-party, Colonel Wellesley (afterwards Duke of Wellington) commanding the reserve. Baird indignantly complained when Wellesley received the appointment of governor of Seringapatam, which he felt was due to his own services. He commanded an expedition sent to Egypt in 1801 for the expulsion of the French. On his return to India in 1802, he found that the star of Wellesley was in the ascendant; and Baird applied for leave of absence. He was received at court with great distinction, knighted in June 1804, and made a K.C.B. in the following August. In 1805 he commanded an expedition against the Dutch settlements at the Cape of Good Hope. In 1807 he commanded a division at the siege of Copenhagen; and in 1808 was sent to Spain with an army of 16,000 men, to assist Sir John Moore. He distinguished himself in the battle of Corunna, January 16, 1809, when his left arm was shattered by grape-shot, and

had to be amputated. On the death of Moore, he succeeded to the command. On this occasion he received, for the fourth time in his life, the thanks of parliament, and was created a baronet. He retired from active service in 1810, and in 1820 was made commander of the forces in Ireland. He died at Fern-Tower, Crieff, August 18, 1829. See his *Life* by Theodore Hook (2 vols. 1832).

Baird, JAMES, ironmaster, was born at Kirkwood, Lanarkshire, 5th December 1802. The fourth son of Alexander Baird, a coal-master, he was educated at Old Monkland, and was for a short time at Glasgow University. In 1826 he was associated with his father and two brothers, William and Alexander, in the leasing of coal-fields at Gartsherrie and elsewhere. Blast-furnaces were added in 1830, and James Baird assumed the active management. Between 1842 and 1864 the blast-furnaces at Gartsherrie, Eglinton, Muirkirk, and elsewhere increased from sixteen to between forty and fifty, capable of turning out 300,000 tons of iron annually, and employing 10,000 men and boys. As the firm increased in wealth, estates to the value of £2,000,000 were acquired by the brothers. James Baird represented the Falkirk burghs in 1851-52 and in 1852-57. In later years he built and endowed various schools, founded the 'Baird Lectures' for the defence of orthodox theology in Scotland in 1871, and in 1873 gifted to the Church of Scotland a sum of £500,000, 'to assist in providing the means of meeting, or at least as far as possible promoting the mitigation of, spiritual destitution among the people of Scotland.' He died at his seat of Cambusdoon, near Ayr, 20th June 1876. He was twice married, but left no family. His property was valued at £3,000,000. See Baird's *Bairds of Auchmadden* (1870).

Baird, SPENCER FULLERTON, LL.D., an American naturalist, was born at Reading, Pennsylvania, 23d February 1823. He was educated at Dickinson College, Carlisle, and became professor of Natural Science there in 1846. In 1850 he was elected assistant-secretary of the Smithsonian Institution at Washington, and in 1878 secretary. He translated from the German and edited the *Iconographic Encyclopædia*; and published Reports on the collections in natural history made by Stansbury, Gilliss, Marcy, and others in the government explorations. In connection with John Cassin, he published *The Birds of North America* (2 vols. 1860), and *The Mammals of North America* (1859); and with Dr Brewer and Professor Ridgway, *History of the Birds of North America* (5 vols. 1870-84). Dr Baird published numerous other papers upon mammals, birds, reptiles, and fishes. In 1871 he was appointed by the president United States Commissioner of Fish and Fisheries, and in that capacity he has accomplished much towards the advancement of fisheries and fish-culture, accounts of the results of this work being embodied in annual Reports. His especial work, while assistant-secretary of the Smithsonian Institution, was the development of the National Museum, which made its beginning under his direction in 1850. A bibliography of his publications, with a biographical sketch, constitutes Bulletin No. 20 of the National Museum. He died 19th August 1887.

Baireuth, or BAYREUTH, capital of the Bavarian province of Upper Franconia, 43 miles NNE. of Nuremberg by rail. Beautifully situated on the Red Maine, it has broad well-paved streets, interspersed with groves, promenades, fine gardens, and public fountains. Its principal buildings are the old palace, dating from 1454; the new palace (1753), containing a gallery of paintings; and the old opera-house (1748). A magnificent

'national theatre' for the performance of Wagner's music, finished in 1875, was in the following year opened with a grand representation of his Nibelungen trilogy. On 14th February 1883, the great master (who died at Venice) was buried in the garden of his villa here. Baireuth's chief articles of industry are cottons, woollens, linen, leather, tobacco, parchment, and porcelain. An active trade is also carried on in grain and horses. Jean Paul Richter died here in 1825, and a monument has been erected to his memory. Pop. (1871) 17,841; (1885) 23,531; of whom only 15 per cent. are Catholics. See R. Milner-Barry's *Baireuth and the Franconian Switzerland* (1887).—The witty and accomplished Wilhelmina, Margravine of Baireuth (1709-58), was the favourite sister of Frederick the Great, and in 1731 was married to Frederick, Margrave of Baireuth. Her *Memoirs*, first published in 1810, were translated into English by the Princess Christian in 1887.

Baitul, or BETUL, a town of British India, in the Central Province, 50 miles NE. of Ellichpur. Pop. over 4700. Baitul district, whose headquarters is Badnur, 4 miles off, is a highland region, rich in coal. Area, 3904 sq. m.; pop. (1881) 304,905.

Baize (old Fr. *baies*), a coarse woollen cloth with a long nap, used mainly for coverings, curtains, linings, but in some countries for clothing.

Baja, a market-town of Hungary, on the Danube, 90 miles S. of Pesth. It is celebrated for its annual swine-fair, and its trade in grain and wine. Pop. (1880) 19,241.

Ba'jan. See BEJAN.

Bajazet I., or BAJAZID, Sultan of the Turks, was born in 1347, and in 1389 succeeded his father, Murad I., who was slain on the battlefield of Kosovo. He inaugurated his rule by strangling his younger brother Yakub, lest he should dispute the succession. In three years he conquered Bulgaria, with parts of Serbia, Macedonia, and Thessaly; he also subdued the greater part of Asia Minor. From the rapidity with which these extraordinary conquests were effected, he received the name of Ilderim—that is, 'Lightning.' He even blockaded Constantinople itself for ten years, thinking to subdue it by famine. To rescue this city, King Sigismund of Hungary (afterwards emperor of Germany) assembled a large army, including 2000 French nobles, and laid siege to the Bulgarian city of Nikopolis, on the Danube. Bajazet hastened to meet him, and gained a decisive victory over the allied Hungarians, Poles, and French (1396). Sigismund escaped, but the greater part of the French, through whose impetuosity the battle was lost, were taken prisoners, and were nearly all executed. Bajazet would now have entirely destroyed the Greek empire, if he had not been prevented by Timur (q.v.), who attacked his possessions in Asia Minor, and completely defeated him (1402) near Angora. Bajazet himself fell into the hands of the conqueror, who treated him with great generosity. The story popularised by Marlowe and Racine, that he was carried about imprisoned in a cage, is without historical foundation, and is probably based on a mistranslation of a Turkish word signifying 'litter.' Bajazet died in 1403, in the camp of Timur. He was succeeded in the government by his son Soliman I. Bajazet was honourably distinguished by his efforts to improve the administration of justice.

Bajazet II., son of the Sultan Mohammed II., the conqueror of Constantinople, was born in 1447, and ascended the Ottoman throne after his father's death in 1481. His reign, which lasted 32 years, was a succession of uninterrupted wars against

Hungary, Poland, Venice, Egypt, and Persia, which were carried on with various success, and which served on the whole to establish the Ottoman power. The submission Bajazet always showed to the wishes of the Janissaries (q.v.) laid the foundation of the later importance of that body. The last years of his reign were much disturbed by disputes between his three sons about the succession to the throne. Influenced by the preference shown by the janissaries for his youngest son Selim, Bajazet abdicated in his favour, but died before he could reach the place of his voluntary exile, in the neighbourhood of Adrianople, in the year 1512. Bajazet was a friend to the dervishes, at the same time liberal and fond of pomp and splendour. Many of the most beautiful mosques in the Ottoman empire were built by him.

Bajimont. See BAGIMONT.

Bajmok, a large village of Hungary, in the province of Bacs, 16 miles SW. of Theresienstadt. Pop. (1881) 6661.

Bajocco, or BAIOTTO (pl. BAJOCCHI), was a copper coin in the Papal States, value nearly a halfpenny. It was 1-100th of the scudo, which was equal to 4s. 3½d.

Bajus, MICHAEL (properly, De Bay), a great Catholic theologian in the 16th century, was born in 1513 in Hainault. He studied at Louvain, became professor of Theology there in 1551, and went as a deputy to the Council of Trent in 1563. He was a devoted student of St Augustine, and his theology was based on that father's views of divine grace, of sin, and of the absence of merit in all good works. His assertion of the inability of the human will, left to its own freedom, to do anything but sin, with his application thereof to the dogma of the immaculate conception, soon drew on him the accusation of heresy. Seventy-six of his propositions were condemned by a papal bull in 1567. He submitted, but was supported by his university, which appointed him its chancellor in 1578. Meantime he maintained a long controversy with the Jesuits, and in 1587 denounced thirty-four of their theses as Pelagian and immoral. He died December 16, 1589. He may be regarded as the predecessor of the Jansenists. See Linsennann, *Michael Bajus* (Tüb. 1867).

Bajza, JOSEPH, a Hungarian poet and prose-writer, was born January 31, 1804, at Szücsi, in Hevê. After his studies at Pesth, he practised there as an advocate, and early gained by his first volumes of verse, published in 1835, a place among the best Hungarian lyric poets. As a contributor to the critical journals, and as editor of the *Figyelmész* (Observer) from 1837-43, he exercised a beneficial influence on the rising literature of Hungary. He translated a collection of foreign dramas (1830); and published an Historical Library (from the German) in 6 vols., a Modern Plutarch, and a Universal History. He died at Pesth, 4th March 1858.

Bakacs, THOMAS, Hungarian statesman, was the son of a peasant, born about the middle of the 15th century. He held several bishoprics in succession, became chancellor of the kingdom, and finally archbishop and cardinal. He preached a crusade against the Turks; but his army of peasants and vagabonds turned their arms against the nobility, and a bloody civil war ensued. He died in 1521, leaving enormous wealth.

Bakalahari, the name of a Bechuana tribe resident in the Kalahari desert, between the Orange River in the south and Lake Ngami in the north, in Africa. They show some disposition for settled life and industrial pursuits, cultivating the soil, and rearing goats.

Bakarganj, a British district in the Dacca division of India, under the lieutenant-governor of Bengal, contains 3649 sq. m. It is fertile, and is watered at once by the lower streams of the Ganges and the Brahmaputra. In the south of the district are the forest tracts of the Sunderbunds. Barisal, the headquarters, on the west bank of Barisal River, is the only town with more than 5000 inhabitants. Bakarganj, the former capital, situated near the junction of the Krishnakati and Khairabad rivers, is now in ruins. Pop. (1881) 1,900,889.

Bakau, a Roumanian town, on the river Bistritza, 187 miles N. of Bucharest by rail. Pop. 13,000.

Bakchiserai (Turkish, 'Garden Palace'), a town in the Russian government of Taurida, the residence of the ancient princes or khans of the Crimea, stands in a deep limestone valley, 15 miles by rail SW. of the present capital, Simferopol. Pop. (1881) 13,377, mainly remnants of the old Tartar inhabitants. The palace (1519) of the khans has been completely restored by the Russian government in the oriental style.

Bake, JAN, a distinguished classical scholar, was born at Leyden in 1787; from 1817 to 1857 was professor of Greek and Roman literature in the university there, and died 26th March 1864. He edited works by Cicero, Longinus, and others; and wrote many admirable critical papers.

Bakel, a town with a strong fort, in the E. of the French colony of Senegal, on the left bank of the Senegal River. Pop. 2600.

Baker, MOUNT, an active volcano in the NW. of Washington Territory, U.S., in the Cascade Range, a continuation of the Rocky Mountains, 20 miles from the Canadian frontier. It is in eruption from time to time, and was very active in 1880. Its height is 11,100 feet.

Baker, HENRY, naturalist, born in London in 1698, from a bookseller's apprentice turned a teacher of deaf-mutes, and, making a largish fortune, in 1729 married Defoe's youngest daughter. In 1740 he was elected a Fellow both of the Royal Society and of the Society of Antiquaries. He contributed many papers to the Transactions of the former society, received its Copley gold medal (1744) for his microscopical experiments, and published a philosophical poem on the *Universe*. He was founder of the Bakerian lectureship, and died 25th November 1774.

Baker, JOHN GILBERT, botanist, was born at Guisbrough, Yorkshire, 13th January 1834, and in 1866 was appointed assistant-curator at the herbarium at Kew. He was for many years lecturer on botany to the London hospital, and in 1882 he received a like appointment from the Apothecaries' Company; he is also a member of the Royal and Linnæan Societies. His voluminous writings include works on the flora of districts so diverse as the north of England, Madagascar, and Brazil; and from his pen have come both popular monographs and scientific catalogues of high value.

Baker, SIR RICHARD, author of the *Chronicle of the Kings of England*, a work without which no country gentleman's library was complete, and often referred to by 'Sir Roger de Coverley.' Notwithstanding its reputation, however, the book had no lack of errors, and now is all but forgotten. Its author, born in Kent about the year 1568, was educated at Oxford University, and was knighted in 1603. In 1620 he was high-sheriff of Oxfordshire; but in 1635 he was thrown into the Fleet Prison for debt which his wife's family had contracted, but for which he had become responsible. Here he wrote his *Chronicle*, first published in 1648,

besides several pious works of less note. He died a prisoner, in great poverty, in 1645.

Baker, SIR SAMUEL WHITE, an African traveller, born in London, June 8, 1821, was educated at a private school and in Germany, and at an early age went to Ceylon. There, along with his brother, he established in 1847 an agricultural settlement and sanatorium at Newera Ellia, 6200 feet above sea-level. He afterwards superintended the construction of the railway which connects the Danube across the Dobrudja with the Black Sea. In 1860 he married a young Hungarian lady of great talent and enterprise, and in company with her he undertook a journey of exploration at his own cost for the discovery of the Nile sources. They set out from Cairo in April 1861, reaching Khartoum in June 1862. When Baker quitted Khartoum to ascend the White Nile, he had an escort of 90 persons, 29 camels, horses, and asses, and three large boats. They had only been at Gondokoro a fortnight, when they were joined by Speke and Grant coming from the south, who told Baker of the Victoria Nyanza, which they had discovered; they also mentioned that the natives had described to them another great lake, named Luta Nzige. Baker resolved to reach this lake; and after many adventures, they arrived, on 14th March 1864, on the top of lofty cliffs, from which they beheld the vast inland sea to which Baker gave the name of the Albert Nyanza. He reached Gondokoro on March 23, 1865. In 1869-73 he commanded an expedition, organised by the pasha of Egypt, for the suppression of slavery and the annexation of the equatorial regions of the Nile Basin. After the British occupation of Cyprus in 1879, he made a thorough exploration of the island, and afterwards journeyed through Syria, India, Japan, and America. Baker was knighted in 1866; on his return from the Nile, he received medals from the Royal Geographical Society and the French Geographical Society; and he was decorated by the Khedive of Egypt. He is a Fellow of the Royal Society and other learned societies; and has received numerous foreign distinctions. Baker has published *The Nile and the Hound in Ceylon* (1854); *Eight Years' Wanderings in Ceylon* (1855); *The Albert Nyanza* (1866); *The Nile Tributaries of Abyssinia* (1867); *Ismailia, an account of his expedition of 1869-73* (1874); *Cyprus as I saw it in 1879* (1879); *Cast Up by the Sea*, &c.

Baker, THOMAS, antiquary, was born at Lanchester, Durham, in 1656, and educated at St John's College, Cambridge. As a non-juror, he lost in 1690 the rectory of Long-Newton, and in 1717 his fellowship, but he spent the last fifty years of his life at his old college, dying there in 1740. He published *Reflections on Learning*, and made valuable MS. collections on the history of the university, amounting to 42 folio volumes; whilst his *History of St John's College* was edited by Professor Mayor in 1867.

Bakewell, an ancient market-town in Derbyshire, on the left bank of the Wye, 25 miles NNW. of Derby. It has warm baths and a mineral spring, a fine but over-restored church, with an 8th or 9th century cross, and charming environs, Haddon Hall and Chatsworth being not far off. Pop. (1881) 2502.

Bakewell, ROBERT, grazier, was born in 1725 at Dishley, Leicestershire, and died in 1795. His fame rests on his successful efforts to improve the breed of domestic animals. His reputation was so great as a breeder of sheep, that he received the almost fabulous sum of 1200 guineas for one season of a ram. The long-horned breed of cattle which he produced is still remembered as the Dishley or New Leicestershire breed. His horses were also

famous, and almost as profitable to him as his sheep. One of his objects was to produce a breed of animals that would fatten on the smallest quantity of food. Yet he was bankrupt in 1776.

Bakhmut, a town of Southern Russia, in the government of Ekaterinoslav, on a tributary of the Donetz. In the town are large works for melting tallow and wax, and near by are valuable coal-mines and alabaster quarries. Pop. (1881) 17,674.

Bakhtegan, or NIRIS, a salt-lake in the Persian province of Farsistan, 47 miles E. of Shiraz. Lying 5100 feet above the sea, it extends 74 miles south-eastward, and varies in width between 4½ and 13½ miles. It largely dries up in summer, when its bed yields very fine salt.

Baking is the mode of cooking food in an air-tight chamber or oven. The term is also applied in the manufacture of Bricks (q.v.), Pottery (q.v.), &c. The baking of bread will be treated under BREAD. The oven that forms part of a kitchen-range is simply an iron chamber, with flues for conveying the heated gases of the fire round it. In baking, strictly so called, the oven is kept close, so that the steam and aroma arising from the inclosed substances are confined; but a great improvement is effected if a current of air is produced by ventilators. The rank taste that often characterises baked dishes is thus avoided; and the process may then be called *oven-roasting*. Ovens are sometimes heated by water (superheated), and frequently now by gas. Meat for baking is placed in a dish, from the bottom of which, in some cases, it is raised on a wire frame or trivet.—Baking, although a convenient mode of cooking meat, is not considered quite so good as Roasting (q.v.). See also OVEN.

Baking Powder is essentially a mixture of tartaric acid and bicarbonate of soda. These are carefully dried and sifted together, some flour being usually mixed with them to dilute the strength. When added to flour in the manufacture of bread or scones, carbonic acid gas is liberated by the action of the water which is used, and this blows or puffs up the doughy mass, giving it the requisite lightness. Frequently the bicarbonate of soda is alone used, buttermilk or the natural acidity of the dough being depended on to evolve the gas. See BREAD.

Bakony Wald (Forest of Bakony), a densely wooded hill-country of Hungary, extending from Lake Balaton northward to the Danube, and dividing the great and little Hungarian plains. Immense herds of swine are annually driven hither to feed upon the mast of the forest. The swineherds furnished those notorious robbers who play so important a part in the ballads of the Hungarian people, and in the imagination of travellers. Its length is about 55 miles, its breadth 25 miles.

Bakshish. The ordinary meaning of this word in Persian is a present; but in the East, in modern times, it has acquired the special signification of gratuity (Fr. *pourboire*, Ger. *Trinkgeld*).

Baku, an important seaport of Russian Transcaucasia, on the Apsheron Peninsula, on a crescent-shaped bay in the Caspian Sea. The bay, which is about 7 miles from point to point, and 15 in circumference, is protected across the mouth by an island, which provides shelter and anchorage for shipping. Since 1883 it has been connected by rail with Tiflis, and so with Poti and Batoum on the Black Sea, 561 miles distant; and since 1887, by the North Caucasus Railway, with Novorossiisk on the Black Sea. The whole soil around Baku is impregnated with petroleum, which, monopolised till 1872, now forms the staple branch of its industry. Some of the fountains ignite spontaneously, and this natural phenomenon has

caused Baku to be esteemed as a holy city by the Parsees or fire-worshippers, many of whom resort to it from very long distances (see *ATESHGA*), although commerce has now invaded the sacred shrine. There is evidence that petroleum has been flowing from the Apeheron Peninsula for 2500 years. Of the 500 petroleum wells at Baku, most are situated on the Balakhani Peninsula, 8 or 9 miles to the north of the town. Lines of pipe carry the oil into the 'black town' of Baku, which is full of oil refineries emitting vast volumes of smoke, black and greasy buildings, and pools of oil refuse. One prolific well, tapped in September 1886, began to spout oil with extraordinary force, deluging the whole district. Nothing could be done to stop the outflow, which, on the eighth day, had reached a daily rate of 11,000 tons, or more than the entire produce of the world at the time. Another gigantic naphtha fountain burst out in March 1887, rising to a height of 350 feet, and after forming an extensive petroleum lake, forced its way into the sea. The production of crude petroleum in 1885 exceeded 420,000,000 gallons, and 120 firms have now oil refineries there. Great and destructive fires have occasionally occurred, as in 1887, when over 14,000 tons of stored naphtha was consumed in a conflagration that raged for five days. The system of carrying oil in bulk, introduced in 1879, has had a tendency to revolutionise the trade, and now there are more than a hundred such specially constructed steamers on the Caspian. The waste or residue is used as fuel in South-east Russia. A concession has been granted by the Russian government for laying down a petroleum pipe 600 miles long, to convey the oil from Baku to a port on the Black Sea. How rapidly the industry grew when communication was established with the outside world may be judged from the fact that the number of drilled wells increased from 1 in 1871 to 400 in 1883. Cotton, silk, opium, saffron, and salt are also exported. The Arabian Masudi is the first who mentions Baku, about 943, and he gives an account of a great volcanic mountain in its vicinity, which is now extinct. Baku was taken by Russia from the Persians in 1806. The marvellous development of the petroleum trade has revolutionised the place. There is a fine railway terminus near the town; and there is much bustling activity here. Persian booths have been replaced by spacious shops to supply the needs of a more advanced civilisation. The harbour, which is strongly fortified, is one of the chief stations of the Russian navy in the Caspian, and is also of great importance as a centre of trade. A good deal of shipbuilding is carried on. Pop. (1879) 15,604, chiefly Persians and Armenians. Baku is capital of a government of Russian Transcaucasia, with an area of 15,516 sq. m., and a pop. (1883) of 569,992. See Marvin's *Baku, the Petrolia of Europe* (1884); *The Region of the Eternal Fire* (1884); *The Coming Deluge of Russian Petroleum* (1886); also the article *PETROLEUM*.

Bakunin, MICHEL, a leading propagator of Anarchism (q.v.), was born near Moscow in 1814 of an aristocratic family, and entered the Russian army, but during service in Poland conceived such a hatred of despotism that he resigned his post. After 1846 he visited Germany, and also Paris, where he met Proudhon and George Sand. He took part in the German revolutionary movement of 1848-49, especially at Dresden, and was condemned to death. He was, however, given up to Russia, where he spent several years in prison, and was next sent to Siberia in 1855, but managed to escape in an American ship to Japan, leaving behind him wife and child, and arrived in England in 1861. In 1865 Bakunin was in Italy diffusing his socialistic views. In 1869 he founded the

Alliance of the Social-democracy, which dissolved the same year in order to enter the International; in September 1870 he attempted an abortive rising at Lyons, with an aim somewhat similar to that of the Paris commune in 1871. As the leader of anarchism, Bakunin was in the International the opponent of Karl Marx; but at the Hague Congress in 1872, he was outvoted and expelled from it. He died at Berne in 1876. Bakunin was most active as an agitator. In connection with his propaganda he wrote several works, in which atheism, materialism, and anarchism are advocated in the frankest and most uncompromising manner. The principal are *L'Empire Knouto-Germanique et la Révolution Sociale*; *La Théologie politique de Mazzini et l'Internationale*; *Dieu et l'État*.

Bala, a town of Merionethshire, North Wales, near the foot of Bala Lake, 12 miles SW. of Corwen by rail. Pop. 1653. Bala Lake measures 4 miles by 1 mile, and sends off the Dee from its foot. From Lake Fyrnwy, 10 miles to the south of Bala, Liverpool derives its new water-supply.

Bala Beds. The rocks of the Bala district, North Wales, contain two limestones, separated by some 1400 feet of arenaceous and slaty strata. The lower limestone (25 feet) is called the Bala limestone, and has been followed over a considerable area; the upper, or Hirnant limestone, is local. The lower, or Bala limestone, is supposed to be the same as the Coniston limestone of Westmoreland. Bala beds form a group of the Lower Silurian. In the Snowdon region they attain a great thickness, and show intercalated sheets of felsitic lava and tuff, bespeaking long-continued volcanic action. See *SILURIAN*.

Balaam, the name of a prophet not of Hebrew blood, mentioned in Numbers, xxii.-xxiv. According to the story, Balak, king of the Moabites, alarmed at the irruption of the Hebrews into his territories, forms a league with the Midianites, and sends messengers to Balaam with the rewards of divination in their hands. Refused permission from God, he consents to go only after a second summons from the king. On the way the angel of the Lord met him. The prophet's ass saw the apparition, and three different times turned aside out of the way in terror. Balaam, not seeing the angel, beat his ass three times, whereupon the beast opened his mouth, and 'spoke with man's voice, and stayed the madness of the prophet.' At last his eyes were opened to see the angel, and he was denounced for his sin. Three different times he tries to curse Israel for Balak, but as often the cursings turn to blessings in his mouth, and he breaks out into the loftiest strains of prophetic poetry in praise of the glorious destiny of Israel. But though he could not belie the prophetic function by cursing the Israelites, he succeeded in causing them for a time to forfeit the favour of Jehovah, by leading them into sin through a special temptation which Balak and the Moabites on his advice spread before them. The prophet perished in the vengeance taken by the command of Jehovah upon the sinners. Such is the strange story of the true prophet 'who loved the hire of wrong-doing,' and who is taken in the Scriptures as the constant type of those men who prostitute their powers and hold the truth in unrighteousness, receiving the wages thereof.

Balachong, a condiment much used in China for eating with rice. It is made of putrid shrimps or small fish pounded with salt and spices and then dried.

Bala'na. See *WHALE*.

Balæniceps ('whale-headed'), or Shoe-billed Stork, is a gigantic gallatorial bird found only on the Upper Nile. It has a large hooked very broad

and flat bill, resembling that of the Boat-bill (q.v.), and lives mainly on lizards and other reptiles. The *Balaniceps rex* belongs to the *Umbres* subdivision of the stork family.

Balanop'tera. See RORQUAL.

Balaghat' ('above the Ghats'), the name given to a large tract of elevated country in the south of India, extending from the rivers Tumbuddra and Krishna in the north to the farthest extremity of Mysore in the south. Also the name of a British district in the Central Provinces. Pop (1881) 340,554.

Balahissar, a village on the site of the ancient *Pessinus*, in the south-western part of the province of Angora, in Asia Minor. The ancient town was famous for its worship of Cybele, and among the fragments of marble columns, friezes, &c., rise the ruins of her gorgeous temple and remains of a theatre in partial preservation, a castle, and a circus.

Balaklava, a small Greek fishing-village with 700 inhabitants, in the Crimea, 8 miles SE. of Sebastopol, from which it is separated by a rocky peninsula. The harbour, which affords secure anchorage for the largest ships, till 1860 was a naval station. It is perfectly landlocked, the entrance being so narrow as scarcely to admit more than one vessel at a time. To the east, overlooking the bay from a rocky eminence, are the ruins of a Genoese fortress. Balaklava is the *Symbolon Linen* of Strabo, and the *Cembalo* of the Genoese (1365-1475), who were expelled by the Turks, as these were in turn by the Russians, when Catharine II. made it the seat of a Greek colony. From September 1854 to June 1856 it was the British headquarters during the Crimean War (q.v.), and the famous charge of the Six Hundred (25th October 1854) has made the name glorious as Thermopylae.

Balance (from Latin *bilanx*), an instrument for ascertaining the mass of bodies in grains, ounces, pounds, or any other units of mass. The ordinary balance consists of a lever called a beam, supported in the middle of its length, and having dishes or scales suspended from either extremity. As it is of importance that the beam should move easily round its support, it rests on polished agate or steel planes, by means of knife-edges of tempered steel, which project transversely from its sides, and serve as the axis of rotation. By this arrangement the surface of contact is practically reduced to a line, and the friction of the axis of the beam on its support almost entirely obviated. The scales are hung by means of chains or cords attached to hooks, which rest on knife-edges turned upwards instead of downwards as in the first case. The essential requirements of a balance of this description are: 1st, That the beam shall remain in a horizontal position when no matter is in either scale; 2d, That the beam shall be a lever of equal arms, or have the distances between the central knife-edge and those at either end exactly the same; and 3d, That the balance shall possess *sensibility*—i.e. shall turn readily from its horizontal position when there is a slight excess of matter in one of the scales. To insure the first of these conditions, it is necessary that the centre of gravity of the beam lie vertically below the point of support when the beam is horizontal. When such is the case, the centre of gravity at which the weight of the beam may be considered to act oscillates as in a pendulum round the point of support, and always comes to rest right under that point, thus restoring to the beam its horizontal position when it has been tilted out of it. If the centre of gravity were above the point of support, the beam would topple over; and if it coincided with that point, there being no restoring force, the beam would occupy indifferently any

position into which it was thrown, the balance in both cases being useless. That a balance possesses the second of the above conditions, is ascertained by putting into the scales masses which keep the beam horizontal, and then transposing them, when, if it still remain so, the lengths of the arms are equal. Should the arms be of different lengths, a less mass at the end of the longer arm will balance a larger mass at the end of the shorter arm (see LEVER); but when transposed, the larger mass having the longer arm, and the smaller mass the shorter, the beam can no longer remain horizontal, but will incline towards the larger mass. A balance with unequal arms is called a false balance, as distinguished from an equal-armed or just balance. When employing a false balance, it is usual to place a body in both scales, and take the arithmetical mean—that is, half the sum—of the apparent masses for the true mass. This is near enough to the truth when the apparent masses differ little from each other; but when it is otherwise, the Geometrical Mean (q.v.) must be taken, which gives the exact mass in all cases.

The third requisite—the sensitiveness—depends upon the weight of the beam, the position of its centre of gravity, and the length of its arms. Let ABD (fig. 1) represent the beam of a balance, C the point of suspension, G the centre of gravity, and ACB the straight line joining the knife-edges, which may be taken as the skeleton lever of the balance. We shall here confine our attention to that construction where the three knife-edges are in a line, because it is the most simple, and at the same time the most desirable. We may, without altering the principles of equilibrium, consider the

Fig. 1.

beam reduced to the lever AB, and embody its weight in a heavy point or small ball at the centre of gravity, G, connected with C by the rigid arm CG. The weights of the scales and contained equal masses act at A and B, and have no influence on the position of the beam since the arms are equal. If a small additional weight, *p*, therefore, act at B, the position of the beam is determined by its rotating tendency (moment) round C, and the counter-rotating tendency of the weight of the beam, *W*, acting at G. The question of sensitiveness is thus reduced to the action of the crooked lever GCB, with *p* acting at one end, and *W* at the other. The relations of the arms and forces of a crooked lever will be found under LEVER. It is only necessary here to state, that the moment of the weight acting at the end of a crooked lever, increases with its size, the length of its arm, and the smallness of the angle which that arm makes with the horizontal line passing through the fulcrum. Consequently, the longer the arms of a balance are, all other things being the same, the greater will be its sensitiveness. Also, the nearer the centre of gravity of the beam is to the point of support, the greater will be the sensitiveness of the balance; and, lastly, the smaller the weight of the beam, the greater will be the sensitiveness of the balance.

In the construction of the balance, it is a matter of importance to have the sensitiveness independent of

the weight of the scales and contained masses, so that, when heavily loaded, a small weight will produce the same inclination as when not loaded at all. This condition is implemented, as we have already shown, when the three knife-edges are kept in the same straight line. If the line joining the two terminal knife-edges lie below the point of suspension, then the centre of gravity of the equal masses will, upon the turning of the beam, be forced from below that point, and will accordingly have a tendency to resume its former position. The equal weights thus counteract to some extent the effect of the additional weight, and their influence in this way will be all the greater as they themselves increase.

When a balance is very sensitive, the beam keeps oscillating for a considerable time from one side to the other of the position in which it finally settles. The stability, or the tendency of the beam to come quickly to rest, depends on requirements nearly the opposite of those which conduce to sensitiveness. In the construction treated of above, the stability increases with the moment of the weight of the beam acting at G round C , so that it thus increases with the weight of the beam, and the distance of the centre of gravity from the point of suspension. The stability is also increased, as already shown, by having the line joining the scale knife-edges below the point of support.

Fig. 2 is the representation of one form of the delicate balances employed in physical and chemical

Fig. 2.

researches. The beam is constructed of aluminium, so as to combine lightness with strength, and rests by a fine agate knife-edge on an agate plane. The pans are also hung on agate knife-edges and planes. In the upper part of the beam is a small body moving on a screw, so that the sensitiveness may be increased or diminished according as the body is raised or depressed. In order that the knife-edges may not become blunted by constant contact with the supporting planes, a cross-bar, with projecting pins, is made to lift the beam from the plane, and the pans from the beam, and sustain their weights when the balance is not in play. The beam is divided by lines marked upon it into ten equal parts, and a small piece of fine wire bent into the form of a fork, called a rider, is made to slide along to any of the divisions. If the rider be, for instance, $\frac{1}{10}$ of a grain, and if, after the mass of a body is very nearly ascertained, it brings the beam, when placed at the first division next the centre, exactly to its horizontal position, an additional mass of $\frac{1}{10}$ of a grain will be indicated. As the beam takes some time before it comes to rest, it would be tedious to wait in each case till it did so, and for this reason a long pointed index is fixed to the beam below the point

of suspension, the lower extremity of which moves backward and forward on a graduated ivory scale, so that when the index moves to equal distances on either side of the zero point, we are quite certain, without waiting till it finally settles, that the beam will be horizontal. When great accuracy is required, a microscope is used to read the oscillations. The balance is surrounded by an air-tight case to keep out dust, &c.; sliding doors giving access to the pans. A small dish of strong sulphuric acid, or dry carbonate of potash, is kept inside to keep the atmosphere of the case dry. Even with the best achievements of mechanical skill, no balance can be made whose arms are absolutely equal; and to remedy this defect, the method of 'double-weighing' is resorted to, when the utmost accuracy is demanded. This consists in placing the body into one scale, and sand, or the like, into the other, until exact equilibrium is obtained, then removing the body, and putting in its place known masses (weights) which produce equilibrium again. The mass of the body must evidently be equal to the sum of the known masses.

The Roman balance, or *Steelyard* (Ger. *Schnellwaage*), is more portable than the ordinary balance.

Fig. 3.

Its construction is indicated in fig. 3. AB is the beam, and C is the fulcrum. Taking the particular case indicated in the diagram, it is evident from the principles of the lever that the mass W is six times the mass P . As the steelyard is ordinarily made, the long arm is heavier than the short one, and therefore the graduation commences from a point between A and C , and not at C .

The *Bent Lever Balance* (Fr. *peseon*, Ger. *Zeigerwaage*), shown in fig. 4, is a lever of unequal arms, A, C, B , moving round the pivot C , having a scale, Q , attached to the shorter arm AC , and a fixed mass, W , to the longer arm CB . The longer arm ends in a pointer moving in front of a fixed graduated arc. When a body is put into the scale, the pointer rises from the bottom or zero point of the arc, and rests opposite the mark corresponding to its weight. The higher the mass W rises, the greater becomes the moment of its weight, and the greater must be the mass whose weight it balances. The arc is generally graduated experimentally.

Fig. 4.

For other weighing apparatus, see **WEIGHING-MACHINES**; and for the law of unjust weighing, see **WEIGHTS AND MEASURES**.

Spring-balance.—The commonest form of the spring-balance, known as *Salter's Balance*, is shown in fig. 5. It consists of a spring in the form of a cylindrical coil in a metal case, which it about half fills when at rest. The upper end of the spring is fixed through the top of the case to a ring by which

it is suspended for use. To the lower end of the spring a rod is attached having an index-pointer working through a slot in the front plate of the case.

Fig. 5.

The substance to be weighed is fixed on a hook at the bottom end of the rod, and the weight as indicated by the stretching of the spring is read off on the scale (a part of the front plate has been removed in the figure, to show the spring inside). Another common form, called the Household Balance, is made to stand on a table, and has a dial-plate on which an index-finger registers the weight. The article to be weighed is put into a pan on the top of the balance. From the under side of the pan a rod goes down into the case; a cross bar at the bottom of this rod is attached to the lower ends of two coiled springs, the upper ends of which are fixed. A rack on the side of the rod, acting on a toothed wheel in conjunction with a system of levers, transfers the action of the rod under the weight in the pan to the index-finger, which registers the amount on the dial-plate. Spring-balances are also made in a great many other forms, and for various purposes, such as

letter balances, parcel balances, &c.; but the principle in all is the same—viz. the stretching of a spiral spring. They have no pretension to great accuracy, but are in extensive use for ordinary purposes, and have the advantages of being portable and having no weights to get lost. The spring-balance is also used as a Dynamometer (q.v.).

Balance of Power, an expression used for that state of things in which no one of the European states is permitted to have such a preponderance as to endanger the independence of the others. This idea is not confined to modern times. The Greeks acted upon it more or less distinctly with regard to the relations of such states as Sparta, Athens, and Thebes. It was, however, more distinctly avowed as a motive of political conduct, and more systematically acted upon, after the time of Charles V. For nearly a century and a half the house of Hapsburg, of which Charles was the first great chief, seemed to strive at universal empire. The Thirty Years' War was waged not only to save Protestantism, and to prevent Austria from becoming master in Germany, but to hinder the predominance in Europe of a single crown. The motive of preserving the balance of power came most distinctly into the foreground in those unions which England, Holland, and Austria repeatedly formed against the menacing schemes of Louis XIV. for acquiring supreme power in Europe. It was the same cause that broke up the most dangerous (for Louis) of these coalitions; for in the war of the Spanish Succession, when the Hapsburg pretender to the Spanish throne became, by the death of Joseph I., sovereign of Austria and emperor of Germany, and the power which, in the hands of Charles V., had menaced the equilibrium of Europe, was thus likely to be again wielded by one man, England withdrew from the coalition, and thus saved Louis from a decided overthrow. The aggressive policy of Napoleon called all the nations of Europe to arms against him in the name of the balance of power; and in readjusting the map of Europe, the balance of power was often invoked to cover the jealousy which resisted not a few claims

to restitution of territory. For some time the balance of power in Europe was embodied in a pentarchy or virtual leadership of the five great powers, who mutually watched one another's movements. The formation of the kingdom of Italy has increased the number of great powers to six. The rise of Germany since the war of 1870-71 has given it a leading place in maintaining the European balance. The great development of Russia, and the continuity of her aggressive policy in the East, form a most important element in the European equilibrium. Since the doctrine of non-intervention has to a large extent gained ground, the idea of a balance of power has been less esteemed in Great Britain. There can be no doubt that the idea has prevailed chiefly since the rise of the great centralising states under absolute dynasties at the close of the feudal period, and that the true welfare of peoples has been again and again sacrificed to the balance of power and to dynastic interests therewith connected. Yet so far as the maintenance of the balance of power has tended to protect the independence of European states against great aggressors, and to prevent the predominance of a single despotic empire, it has been beneficial. Further, it may be pointed out that so long as Britain is an imperial state, she cannot altogether abstain from intervention in European politics, and from considering how the balance of power there affects her interests. On the whole, though the idea of a balance of power in its old form has fallen into disrepute, it may still be considered a working factor in politics. And the subject is greatly widened and complicated by the extension of European influence and European possessions all over the world. Interesting points in this connection are the rivalry of Russia and Britain in the East, the difficulties chiefly with France as to the regulation of Egypt and the Suez Canal, the rise of the colonial power of Germany, and the entry of China and Japan into the circle of European policy. See Dilke's *European Politics* (1887).

Balance of Trade. The theories connected with the balance of trade arose out of the 'mercantile system' of political economy. In the mercantile system, which looked upon the possession of gold as the grand aim, it not unnaturally came to be a maxim that a nation becomes richer in proportion as the money-value of its exports exceeds that of its imports; the excess being paid in gold, was thought to be just so much added to the national wealth. Now, the difference between the money-value of the exports and imports of a state is called the 'balance of its trade'; and by the adherents of the mercantile system, this balance was said to be 'in favour' of the country or 'against' it, according as the exports or the imports showed the excess.

As a practical result of this theory, every sort of device was adopted in order to bring out a favourable balance. Laws were enacted prohibiting importation of foreign manufactures, or imposing high duties upon them, and giving premiums and other protective encouragements to exportation. The aim of commercial legislation, in short, was to promote the flow of the precious metals to one's own country, and to keep them there. The fallacies of the balance of trade were obviously due to a mistaken conception of the nature of wealth, and must therefore be traced to the errors of the Mercantile System (q.v.).

Connected with this, though very different, are the recent discussions regarding the balance of trade. For many years the imports of Great Britain have in value greatly exceeded the exports. Will not this tend eventually to the national impoverishment, especially as so large a proportion of

the imports is devoted to consumption as food and luxuries? With reference to this question, the following points should be considered: That a great proportion of the revenue of this country is drawn from investments abroad, and with these investments we can pay largely for our imports; also that an important part of our business with foreign countries consists in a carrying trade, from which we draw considerable profits. In point of fact, our national wealth is continually growing, though doubtless Britain has reached a stage when an increasingly large proportion of its wealth must be devoted to investment abroad, and a less proportion to productive work at home. In this question there is a special necessity for a criticism of statistics, figures being so misleading unless they are carefully scrutinised.

Balanoglossus, a worm-like animal of much zoological interest as a connecting link between invertebrates and vertebrates. The genus, which includes at least four species, occupies so unique a position that it is regarded as representative of a distinct class of Enteropneusta ('gut-breathers'). The animals live in fine sand, which they appear to saturate with slime. They eat their way through it, drawing themselves on by means of the contractions of the most anterior part of their body.

Young *Balanoglossus*; showing proboscis, collar, gill-slits, and gastric region (from Claus).

The body is richly ciliated and extremely soft; and it is thus very difficult to obtain large specimens intact. *Balanoglossus sarniensis*, which occurs as a rarity in the English Channel, has been aptly compared, as regards its softness, to wet bread. This form may attain a length of 8 inches or more. Two species have been found in the Gulf of Naples, and two in more northerly waters. The body exhibits four distinct regions, a large 'proboscis' in front of the mouth, a muscular collar of some length, a respiratory region, through slits in which water flows out from the gullet, and lastly, a long gastric region with most of the digestive and reproductive systems.

Apart from numerous peculiarities in the structure and development of *balanoglossus*, the general fact of importance is its remarkable combination of characters uniting it to widely separated types. It is what is known as a synthetic type—that is to say, it unites features characteristic of very different groups. In the language of zoological pedigree, it is a survivor of an ancestral group from which several others started. Thus the larva, which is known as *Fornaria*, is in some respects 'intermediate between the larva of an echinoderm and the larval type common to molluscs, chætopod worms,' &c. Indeed, Johannes Müller, who first described the *Fornaria*, regarded it as the larva of an echinoderm. This very close structural resemblance between the *Fornaria* and the typical echinoderm larva is usually interpreted as suggesting a common origin for the two groups. Quite as striking are the affinities between *balanoglossus* and a primitive vertebrate. As in the latter the anterior

portion of the alimentary canal, which is supported by a horny basket-work, is pierced by paired respiratory gill-slits, to all appearance comparable to those which persist in low vertebrates, and appear in the embryonic life of all. There are also structures which are believed by some to be more or less directly comparable to the dorsal nerve-cord and the supporting axis or notochord, so characteristic of vertebrates. Undoubted affinities must be admitted, and this fact likewise is interpreted in terms of the history, by regarding *balanoglossus* as a survivor of a primitive ancestral group, from which not only echinoderms, but vertebrates diverged. See CLASSIFICATION, VERTEBRATA, WORMS; and for full information, Bateson's papers in *Quarterly Journal of Microscopical Science* (1884).

Balanus. See ACORN-SHELLS.

Balasior, a tributary state of India, in the province of Guzerat, Bombay. Area about 150 sq. m.; pop. 42,000.—The chief town, Balasior, is 51 miles N. of Baroda. Pop. 9000.

Balaser, a seaport and chief town of a district of Bengal, on the right bank of the Burabang River, 15 miles from its mouth. It has dry-docks and a coasting-trade. Pop. (1881) 20,265.

Balaton, LAKE (Ger. *Platten-See*), a lake, the largest in Hungary, about 55 miles SW. of Pesth. Lying 426 feet above sea-level, it has an extreme length of 48 miles, an average breadth of 10 miles, and an area of 245 sq. m. Its mean depth is 20 feet, but in one part it sinks to 150. It is fed by upwards of thirty streams—the chief of which is the Szala—as well as by numerous springs which rise on its margin. Its outlet is by the Sio, which discharges itself into the Sarvitz, a feeder of the Danube. The waters of Balaton are clear and transparent, except when they are agitated by a storm, when they assume a bluish colour. They have a slightly brackish taste. Fish of various kinds are found in abundance, including the *fogash*, a kind of large perch, weighing from 10 to 20 pounds, and found only in this lake. The lake figures prominently in the old romantic ballads of the Magyars.

Balausta. See BERRY.

Balbi, ADRIANO, geographer and statistician, was born in Venice in 1782, and in 1808 was appointed lecturer on Geography at Murano, in 1811 on Physics at Fermo. A subsequent residence in Portugal led him to publish at Paris in 1822 a work of great value on the statistics of Portugal. Balbi lived in Paris till 1832; he then returned to Italy and settled at Padua, where he died 14th March 1848. His *Atlas Ethnographique du Globe* (Par. 1826) is distinguished by its extensive accumulation of facts and views, giving an account of German researches on the subject, and entering into questions of comparative philology. His best known work is the *Abregé de Géographie* (1832). His *Scritti Geografici* were edited by his son, Eugenio (5 vols. Turin, 1841–42).

Balbi, GASPARO, a Venetian merchant of the 16th century, who is worthy of mention as the first traveller who has left an account of India beyond the Ganges. In the pursuit of his calling, Balbi was often led to Aleppo, and from thence, on one occasion, he made a visit to India which lasted several years. A Latin translation of his *Viaggio* (1590), or account of his travels, was printed at Frankfurt in 1594. In his journey he visited Bagdad, Bassora, Goa, Cochín, and Pegu. He minutely records his own observations, but is excessively credulous in accepting information at second-hand.

Balbo, CESARE, COUNT, an Italian statesman and author, was born 21st November 1789 at Turin.

His father enjoyed the patronage of Napoleon; consequently the son served in various capacities under the empire, and afterwards as secretary of the Sardinian embassy at London. During the years 1821-43, he produced several works of a politico-historical nature. His *Speranze d'Italia* ('Hopes of Italy'), published in 1843, gave a vivid and intelligent picture of the political condition of Italy. It did not aim, however, at Italian unity, but rather suggested a confederacy of independent states, under the supremacy of the pope. Balbo's adherence to the Roman Catholic Church is strongly marked in all his works. He took a prominent part as a moderate Liberal in the political movements of 1847-48. He died 3d June 1853. See *Lives* by Ricotti (1856) and Reuchlin (1860).

Balboa, VASCO NUÑEZ DE, a Spanish conqueror, was born of a noble but reduced family at Xeres-de-los-Caballeros in 1475. After rather a dissolute youth, he gladly took part in the great mercantile expedition westward of Rodrigo de Bastidas. He established himself in St Domingo, and began to cultivate the soil; but fortune proving adverse, in order to escape from his creditors, he had himself smuggled on board a ship, and joined the expedition to Darien in 1510, commanded by Francisco de Enciso. An insurrection which took place obtained for Balboa the supreme command in the new colony. Confused accounts which reached him of a great western ocean, impelled him in 1513 to set out in quest of it. On the 25th of September of that year, he obtained the first sight of the Pacific Ocean from 'a peak in Darien'. The governorship of the territories conquered by Balboa was obtained in 1514 by Pedrarias Davila, by means of his intrigues at the Spanish court. Balboa resigned the command into the hands of the new governor, a narrow-minded and cruel man, and, in a subordinate situation, undertook many successful expeditions; but these and all his other merits only served to increase Davila's hatred towards him. Balboa married his enemy's daughter; but on the first occasion of dispute, he was induced by Davila to deliver himself up, was accused of a design to rebel, and in violation of all forms of justice, was beheaded at Santa Maria in 1517.

Balbriggan, a watering-place in Dublin county, 21 miles N. by E. of Dublin. It is a seat of linen, cotton, calico, and stocking manufactures. The cotton stockings made here are remarkable for fineness of texture and beauty of open work. Many women are employed in embroidering muslin. Pop. (1881) 2443.

Balcony (till about 1825 BALCO'NY; Ital. *balcone*), a projecting gallery in front of a window or of several windows, with a balustrade or parapet at its outer edge, and supported by consoles, or brackets fixed in the wall, or by pillars resting on the ground below. The balcony was unknown in Greek and Roman architecture, the earliest examples of it occurring in Italy, to the climate of which country it is peculiarly adapted.

Baldachin (Ital. *baldacchino*), a canopy of the form of a tent or umbrella, made of costly materials and richly adorned, which is either supported on pillars, or fastened to the roof over a throne or couch, or over a pulpit, an altar, or other sacred object. One of the most celebrated is the baldachin in the church of St Peter's in Rome, cast in bronze by Bernini, which is supported on four large twisted columns. From the days of Constantine, altars were often overshadowed by canopies called *ciboria*, from their resemblance to the bowl of a cup; and the sacrament was placed in a vessel suspended by a cord from the interior of this cupola. The proposal to erect a baldachin in

St Barnabas Church, Pimlico, gave rise to litigation, which ended in a decision (15th December 1873) against the legality of such a structure in an Anglican church. Baldachin is also the name given to a kind of umbrella of a square form, supported on four poles, borne over the priest who carries the Host. The name, as well as the thing itself, comes from the East, where a baldachin was borne as a symbol of their rank over the heads of the great. Such canopies were often sent as presents from eastern princes to those in the West; as, for example, from the Calif Haroun-al-Raschid to Charlemagne. During the Crusades, and the consequent trade with the East, they became well known to the Italians, and baldachin is merely a corruption of Baaldak, the name by which Bagdad was then known to Europe.

Balder, or BALDUR, the hero of one of the most beautiful and interesting myths in the Edda, was, according to northern mythology, son of Odin and Frigga, and the husband of Nanna. Having dreamed evil dreams which threatened his life, he related them to the gods, whereupon they held a council, and endeavoured to secure his safety. Frigga took an oath from everything in nature, animate and inanimate alike, that it would not harm Balder, but she forgot the mistletoe. The gods, thinking Balder safe, in their mirth wrestled with him, and cast darts and stones at him. The malicious Loki alone took no part in the play, but changing himself into the form of an old woman, found out from Frigga that the reason for Balder's invulnerability was that everything but the little mistletoe had sworn not to harm him. Loki went in haste to fetch a bough, and repaired with it to the assembly of the gods, where he placed it in the hands of the blind Höder, the god of war, and directed his aim against Balder, who fell pierced to the heart. The sorrow of the gods was unutterable. Hermoder (the nimble) at once started on his journey to ask Hel, the goddess of Hades or the grave, to release Balder. She at once consented, on condition that all things should weep for Balder. All things wept, save the witch or giantess Thökk (the step-daughter of Loki), and so Balder must remain in the kingdom of Hel until the end of the world. At his funeral the pyre was placed on board his ship in presence of the frost-giants.

Balder is the best and wisest of the Æsir. His death is the great turning-point of the drama, as it proves the mortal nature of the gods. The powers of evil could not prevail as long as he lived, but his death is the doom of all the Æsir. Loki and his brood of wicked monsters are at first subdued, but at last they burst their bonds, and the great catastrophe of Ragnarök ensues. After long winter and war between the gods and the collected frost-giants, the forces of cold, fire, and darkness, in which both adversaries perish, comes the complete renovation of the world, in which the chief of the Æsir are hallowed and purified, and Balder returns from the under-world to inaugurate a reign of happiness and peace. It is probable that in the story of Balder there is an admixture of physical and moral allegory. Originally a nature-myth, it underwent a transformation through the addition of ethical conceptions, but the same early form continued to express the later religious ideas. See SCANDINAVIAN MYTHOLOGY; Grimm's *Deutsche Mythologie*; and Schwartz, *Indogermanischer Volks Glaube* (Berl. 1885).

Baldmoney is a popular name for several kinds of Gentian (q.v.), also for an umbelliferous plant (*Meum athamanticum*) used as a carminative medicine.

Baldness (Gr. *alopecia*, 'fox-mange'). See HAIR. *Congenital baldness* (complete absence of hair at birth) is sometimes met with; but in most cases is only temporary, and gives place in a few years to a natural growth of hair. Occasionally, however, it persists through life.

Senile baldness (calvities) is one of the most familiar signs of old age. It commences in a small area at the crown, where the natural hair is first replaced by down before the skin becomes smooth and shining. From this area the process extends in all directions. It is more common in men than women. A precisely similar condition occurs not unfrequently at an earlier age (presenile baldness). It is generally due to hereditary tendency; but is favoured by keeping the head closely covered, especially with a waterproof cap. The best authorities agree that this form of baldness is incurable.

There is a condition, however, which in its later stages much resembles the last, but is more amenable to treatment. Here the loss of hair begins simultaneously at two spots, at the crown, and about an inch behind the margin of the hair on the forehead. Its chief characteristic, however, is that loss of hair is preceded for some years by extreme scurfiness of the scalp. During this stage the process can be checked; sometimes, indeed, even after loss of hair has begun. The most successful treatment consists in thorough rubbing of the scalp with an ointment containing 1 part of precipitated sulphur to 10 parts of lard, at first nightly, then as the scurf diminishes, at gradually longer intervals.

Great loss of hair frequently follows severe illnesses or other causes which produce general debility. As health returns, the hair usually returns with it; its growth may be promoted by the use of lotions containing cantharides, ammonia, or some other stimulating agent. Baths containing common salt, and brisk rubbing, are also useful.

Baldness in patches (*alopecia areata*) attacks chiefly children and young persons, frequently those of debilitated constitutions. The only change at first perceptible is that the hair falls out in one or more places, leaving smooth bare patches. These may gradually extend, and with the progress of the disease the affected skin becomes somewhat thinned. The scalp is the part most commonly attacked; but the disease may destroy every hair on the body. It is liable to be mistaken for Ringworm (q.v.); but in that disease the skin is rough and scaly, and the hairs, though broken off short, are not completely lost. *Alopecia areata* has been attributed to the action of a parasite; but it is more probably due to some obscure nervous influence. Mild cases almost always recover; and even in the worst forms of the disease complete restoration of the hair may take place, sometimes after many years of baldness. The treatment consists in stimulation of the affected skin, blistering, salt baths, the use of electricity, &c.

In this as in all other forms of loss of hair, attention must be paid to the general as well as the local treatment. A liberal diet and the use of iron and other tonics are frequently of the greatest service.

The numerous and much advertised hair restorers, &c. in the market contain various stimulating substances, and are, generally speaking, beneficial in their action.

Baldric is a belt or sash worn partly as a military and partly as a heraldic symbol. It goes round the waist as a girdle, or passes over the left shoulder, and is brought down obliquely under the right arm, or is suspended from the right shoulder in such a way as to sustain a sword. Many of the

effigies of knights contain representations of the baldric, more frequently as a belt than a shoulder-sash.

Baldung, HANS, called also Hans Grün, a German painter and engraver, contemporary with Albert Dürer, to whom, in expression, colouring, and finish, he was little inferior. He was born at Gmünd, in Swabia, about 1476, and died at Strasburg in 1545. His masterpiece, a painting of the Crucifixion, is in the cathedral of Freiburg; his wood-engravings are numerous.

Baldwin I., king of Jerusalem, 1100-18, was born in 1058. He was the youngest brother of Godfrey (q. v.) de Bouillon, with whom he took part in the first Crusade; but having quarrelled with Tancred, he retired to Edessa, of which he was soon after elected prince. After the death of his brother Godfrey, in 1100, he became Protector of the Holy Sepulchre, and Baron of Jerusalem, and immediately assumed the regal title, which his brother had refused. He conquered Caesarea, Ashdod, and Tripolis, and, with the assistance of a Genoese fleet, made himself master also of Acre, and subsequently of Sidon, but failed to reduce Ascalon. He died in 1118.—BALDWIN II., cousin and successor of Baldwin I., reigned from 1118-31. During his reign Tyre was taken, and the order of the Templars was instituted. He died in 1131, having resigned the crown in favour of his son-in-law, Foulques of Anjou, who reigned till 1134.—BALDWIN III., king of Jerusalem, 1143-62, the son and successor of Foulques of Anjou, was born in 1129. He was regarded as a model of knight-hood, and his authority and influence were great. He died in 1162, and with his death the Christian power in the East began to decline. He was succeeded in the government by his brother Amalric, who died in 1173.—BALDWIN IV., the son and successor of Amalric, surnamed the Leper, reigned till 1184, when he caused BALDWIN V., a child of six years old, the son of his sister Sybilla, to be crowned. The child died in 1186.

Baldwin I., the first Latin emperor of Constantinople, was born at Valenciennes in 1171 A.D., and succeeded his parents as Count of Hainault and Flanders in 1195. In 1200 he joined the fourth Crusade, and assisted in the recapture of Constantinople for the Emperor Isaac II. As the latter failed in his payments, the Crusaders turned their arms against him, and sacked the town. Alexis having been murdered in a rising of the citizens, Baldwin was chosen emperor, and crowned in 1204. The Greeks, invoking the aid of the Bulgarians, rose and took Adrianople. Baldwin laid siege to the town; but, defeated and taken prisoner by the Bulgarian king, he died about a year after (1206) in captivity.

Baldwin II., emperor of Constantinople, was born in 1217. He was the son of Peter de Courtenay and Yolanda, Countess of Flanders, sister of Baldwin I. He was but 11 years old when, by the death of his brother Robert, he succeeded to the throne; and he never had the means or the ability to maintain his position against his powerful Greek and Bulgarian opponents. Two begging-visits to Western Europe were not successful in procuring him sufficient forces to resist his foes; in 1261 his capital was taken by one of the generals of Michael Palaeologus; and Baldwin fled to Italy. With him terminated the Latin empire in the East, after it had lasted 57 years. He died in 1273.

Bale. See BASEL.

Bale, JOHN, Bishop of Ossory, was born at Cove, near Dunwich, Suffolk, in 1495. From a Carmelite monastery at Norwich he passed to Jesus College, Cambridge, and obtained a living in

his native county, though he had already turned Protestant. In 1540 he had to flee to Germany, whence, in 1547, he was recalled by Edward VI., who two years later made him Bishop of Ossory in Leinster. Here 'Bilious Bale' made himself so obnoxious to the Catholics by his zeal in the Protestant cause, that, on news of the death of Edward, his house was attacked and five of his servants killed. His effects were destroyed, and he himself escaped out of the country only with great difficulty. On the accession of Elizabeth he returned to England, and was made a prebendary of Canterbury. He died in 1563. His fame rests partly on a Latin history of English literature (1548), which, notwithstanding that sections of a book are not unfrequently set down in it as distinct works, and that persons who never wrote anything are given as authors, is a valuable work. He occupies, also, an important place in the history of the drama. His plays are sorry doggerel; yet his *Kinge Johan* (Camden Society, 1838) is a link between such moralities as his own *Breve Comedy of Johan Baptyste* and the masterpieces of the Elizabethan stage. The Parker Society published his select works (1849).

Balearic Isles, a group of islands—Mallorca (Majorca), Minorca, Iviza, Formentera, Cabrera, and several smaller islets—lying off the coast of Valencia. They formed from 1220 to 1344 the kingdom of Mallorca, which was united in 1349 with the crown of Aragon. They now form a Spanish province, and together have an area of 1935 sq. m., with a pop. in 1884 of 306,847. The soil generally is good. Vines, olives, and other fruit-trees are cultivated abundantly; but corn has to be imported. The coasts are precipitous, with some excellent harbours—Port Mahon, in Minorca, being one of the finest in Europe. The Phœnicians visited the Balearic Isles at a very early date, and they were followed by the Greeks. Later, the Balearic Isles became subject to Carthage; but after a short period of freedom, during which their inhabitants became pirates, were annexed to the Roman empire by Metellus (*Balearicus*), 123 B.C. The *Baleares* were famous slingers; their name was derived by the ancients from the Greek *ballein*, 'to throw.' See the articles on the several islands, also SPAIN; and Bidwell's *Balearic Isles* (1876).

Baleen, a name for whalebone. See WHALE.

Bale-fire. See BEACON.

Balfe, MICHAEL WILLIAM, composer, was born in Dublin, 15th May 1808. His musical talent received early culture, and in his ninth year he made his debut as a violinist, having begun to compose at least two years earlier. In 1823 he came to London, and during 1825-26 studied in Italy under Paer, Galli, Federici, and Rossini. In 1826 he wrote the music for a ballet, *La Pérouse*, performed at Milan; and in 1827 he sang in the Italian Opera at Paris with great applause, his voice being a pure rich baritone. In 1833 he returned to England, and in 1846 was appointed conductor of the London Italian Opera. He died at Rowley Abbey, his estate in Hertfordshire, 20th October 1870. Of his numerous operas, operettas, and other compositions, produced in rapid succession from 1830, the most permanently successful have been *The Bohemian Girl* (1843), *The Rose of Castile* (1857), and *Il Talismano* (1874). If Balfe was wanting in depth and dramatic force, he had a very thorough knowledge of effect and command of orchestral resources; and his compositions are distinguished by fluency, facility, and melodic power. Some of the defects of his operas may be justly attributed to 'Poet Bunn,' the theatrical manager, who at once wrote and translated the libretti, and put the operas on the stage. Many of Balfe's songs are admirable.

See Kenney's *Memoir of Balfe* (1875), and Barrett's *Balfe and his Works* (1892).

Balfour, THE RIGHT HON. ARTHUR, was born in 1848, and in 1856 succeeded his father in the estate of Whittingham, Haddingtonshire. Educated at Eton and Trinity College, Cambridge, he entered parliament in 1874 as Conservative member for Hertford, and from 1878 to 1880 was private secretary to his uncle, Lord Salisbury, whom he accompanied to the Berlin Congress. For a while an unattached member of Lord Randolph Churchill's 'Fourth Party,' he led off the attack on the 'Kilmainham Treaty' (1892), negotiated with Lord Hartington the franchise compromise (1884), was returned for East Manchester (1885), and was appointed president of the local government board (1885), secretary for Scotland (1886), and chief-secretary for Ireland (1887-91), in which most difficult position he showed himself cool, clear-sighted, quick to think, speak, and act. In 1891 he became First Lord of the Treasury and leader of the House of Commons. His *Defences of Philosophic Doubt* (1879) is a clever application of scientific methods to science, its theme the irrationality of rationalism.—His brother, FRANCIS MAITLAND BALFOUR, embryologist, was born at Edinburgh in 1851, and educated at Harrow and Trinity College, Cambridge, where he was elected to a fellowship. He soon entered upon researches on the development of the elasmobranch fishes, which threw new light on many problems of vertebrate morphology; and also took a leading part in the work of founding the then incipient Cambridge school of natural science. In 1878-83 appeared his well-known *Comparative Embryology*, upon which his fame chiefly rests. Besides receiving many scientific distinctions, and declining tempting offers from Oxford and Edinburgh, he was appointed to a special chair of Animal Morphology in 1882. But on the 19th July of that year he lost his life while attempting to climb one of the spurs of Mont Blanc. Besides his book, a research studentship at Cambridge, which has already borne ample fruit, commemorates his name.

Balfour, SIR JAMES, Lord President of the Court of Session, was a son of Sir Michael Balfour of Montquhanie, Fife. In early life he was implicated in the plot against Cardinal Beaton, and on the surrender of the castle of St Andrews (1547) he was carried prisoner to France with John Knox. Two years later he purchased freedom by apostasy, and returning to Scotland, entered on that infamous career in which he 'served with all parties, deserted all, and yet profited by all.' We find him the recipient of favours under the regency, as he was under the queen—a privy-councillor, commendator of the Priory of Pittenweem, clerk register, and finally Lord President of the Court of Session, with a pension of £500. When Morton was made regent, Balfour contrived to curry favour with him, and received from him a commission to make a general digest of the law. It is doubtful, however, how far the *Practicks of Scots Law* that bears his name is really his; for, not feeling himself safe in Scotland, he left it for France, where he remained seven years (1573-80). He died in 1583.

Balfour, JOHN, of Kinloch, or of Burley, in Scott's *Old Mortality* was one of the chief actors in the assassination of Archbishop Sharp in 1679, for which his estate was forfeited, and a price set on his head. He fought at Drumclog and Bothwell Bridge, and is said afterwards to have escaped to Holland. By one account he died on a homeward voyage to Scotland, by another he never left the country, but settled in the parish of Roseneath, Dumbartonshire. Balfour of Kinloch is quite a different personage from Lord Balfour of Burleigh,

who succeeded to the title in 1663, spent his youth in France, and died in 1688.

Balfour, JOHN HUTTON, born in Edinburgh, September 15, 1806, graduated at the university of Edinburgh, and abandoning his intention of entering the church, took the degree of M.D. in 1831. From 1841 to 1845 he was professor of Botany at Glasgow University, and in the latter year succeeded to the same chair in Edinburgh, and was nominated regius keeper of the Royal Botanic Garden, the efficiency of which was greatly extended under his rule. In 1879, after being for thirty years dean of the medical faculty, he resigned these appointments, the universities of Edinburgh, Glasgow, and St Andrews conferring on him the degree of LL.D. He died at Edinburgh, February 11, 1884. Professor Balfour was for many years secretary of the Royal Society of Edinburgh, and was a member of numerous British and foreign learned societies. More eminent as a teacher than as an original investigator, he published a number of useful text-books and other works on Botany, including a *Manual*, *Class-book*, *Outlines*, and *Elements*, and contributed the article on that subject to the 8th and 9th editions of the *Encyclopædia Britannica*.

Balfurush' (or more correctly BARFURUSH, 'mart of burdens'), a town in the Persian province of Mazanderan, on the river Bhawal, 12 miles from its mouth in the Caspian Sea. The river is not navigated, all goods being landed at the port of Meshed-i-Ser, on the Caspian. Balfurush is a centre of trade between Russia and Persia, exporting large quantities of silk, rice, and cotton, while the Russians supply iron and naphtha. It has excellent bazaars, numerous caravanserais, and several Mohammedan colleges. The population is generally stated at 50,000, but some put it as low as 10,000.

Balguy, JOHN, a liberal divine, was born at Sheffield in 1686, and educated at St John's College, Cambridge. In 1718 he published two pamphlets in defence of Bishop Hoadley; his later works are defences of Dr Clarke's views against Shaftesbury, Tindal, and other deists. His *Essay on Redemption* (1741) showed a rationalistic tendency. Hoadley gave him a Salisbury prebend in 1727; and the chapter of Durham the Yorkshire vicarage of North-allerton in 1729. He died at Harrogate in 1748.

Bali, or LITTLE JAVA, one of the Sunda Islands, lying east of Java, about 75 miles long by 50 broad. Its area is 2300 sq. m.; pop. 760,000. A chain of mountains crosses the island from east to west, rising in the volcanic peak of Gunung-agung to 12,379 feet. Agriculture is the chief employment of the people. They grow rice, indigo, cotton, fruits, maize, and edible roots, and possess buffaloes and cattle. Fish are plentiful. Coffee is now exported in considerable quantity from Buleleng, the trading capital. The Balinese are a superior race, and speak a language related to Javanese. They excel as sculptors, and in working gold, silver, and iron. Their religion is Brahmanism of an ancient type, and they still keep up some of the cruel rites of the Hindus which have disappeared from India. Under the Dutch, the nine little principalities of the island are governed by native rulers. Chinese and a few Europeans are the chief traders.

Baliol, an Anglo-Norman family that played a prominent part in Scottish history. Its founder, Guido or Guy, held Bailleul, Harcourt, and other fiefs in Normandy, and from Rufus, whose father he had followed to England, received broad possessions in Durham and Northumberland. Bernard, his son, built the fortress of Barnard Castle; and his great-grandson, John, about 1263 founded Balliol College, Oxford. He died in 1269, and was

survived till 1290 by his widow, Devorguila, the daughter and co-heiress of Alan, Lord of Galloway, and the great-great-granddaughter of David I.—Their son, JOHN DE BALIOL, born in 1249, succeeded in her right to the lordship of Galloway, as well as to his father's vast possessions in England and Normandy. On the death of the Maid of Norway in 1290, he became a competitor for the crown of Scotland, and his claim was pronounced superior to that of the other principal competitor, Robert Bruce, Lord of Annandale. The arbiter was Edward I. of England, who found this a fit opportunity for asserting his claim as lord-paramount of Scotland. That claim was acknowledged by the Scottish Estates in submitting the contest to his decision; and, consistently with this ignominious submission, Baliol, before and after his coronation at Scone (1292), swore fealty to Edward as his feudal superior. He was soon made to feel that his sovereignty was merely nominal, and, abject as he had shown himself, the indignities which he experienced at length roused him to an assertion of his rights as king. In 1295 he took upon him, by the advice of his nobles, to conclude an alliance with France, then at war with England. This act of revolt was followed by speedy chastisement. Edward invaded Scotland with a large force; defeated the Scottish troops; took Baliol prisoner, and compelled him formally to surrender his crown, July 7, 1296. Baliol was confined for three years at Hertford and in the Tower, enjoying, however, a limited freedom and something of royal state. In 1302 he was permitted to retire to his estates in Normandy, where he died in 1315, the year after Bannockburn. The estimate by his subjects of this poor-spirited prince was significantly indicated by the nickname of 'Toom Tabard,' or Empty Jacket.—EDWARD, his son, in 1332 made himself momentarily conspicuous in history by his daring and successful invasion of Scotland. Accompanied by the 'disinherited barons,' who were bent on recovering their forfeited Scottish estates, he landed with 3400 followers at Kinghorn in Fife; defeated the Earl of Fife; pushed boldly into the country; and at Dupplin Moor in Perthshire, on the night of 12th August, surprised and routed 30,000 men under the new regent Mar, who himself was slain, with 13,000 besides. On 24th September, seven weeks from the date of his landing, he was crowned king of Scotland at Scone. He had not enjoyed the kingly dignity for full three months, when he was surprised in his camp at Annan by Archibald Douglas, and nearly lost his life as well as the crown he had so recently assumed. His subsequent career is the very reverse of what might have been anticipated from so adventurous a beginning, being marked only by weakness, servility, and misfortune. He died near Doncaster in 1367, and with him ended the house of Baliol.

Balista. See BALLISTA.

Balistés, or FILE-FISH, a genus of bony fishes of the order Plectognathi (q.v.) of Cuvier; the type of a large family, Balistidae, the species of which are almost all inhabitants of tropical and subtropical seas, frequenting rocky coasts and coral-reefs. One species has been occasionally found on British coasts. Their colours are generally brilliant. The skeleton, as in the other Plectognathi, is in part gristly or cartilaginous, and the external covering of the body often resembles that of the Ganoid (q.v.) fishes, consisting, in some of the genera, of bony plates, disposed in regular rows, and not overlapping; in others, of very small rough scales, with stiff bristles, as densely crowded as the pile of velvet. The snout protrudes slightly, and the teeth are few, but well developed. But the most interesting thing in connection with these

fishes, is the provision for fixing the first dorsal spine in an erect position, or lowering it at the will of the animal. The spine is articulated by ring and bolt to a broad bony plate in connection with the backbone. 'When the spine is raised, a depression at the back part of its base receives a corresponding projection from the contiguous base of the second ray, which fixes it like the hammer of a gun-lock at full cock, and

Balistes conspicillum.

it cannot be let down until the small spine has been depressed, as by pulling the trigger; it is then received into a groove on the supporting plate, and offers no impediment to the progress of the fish through the water. This trigger-like fixing of the spine takes place also in the dead fish; and when a *Balistes* is removed from the bottle for examination, it is generally necessary to release the spine by pressing on the small trigger-ray.' The fish is called at Rome *pesce balestra*, in reference to the resemblance between the principle of the above mechanism and that of the Roman dart-throwing engine, *ballista*. The first spine is roughened with enamel projections, whence the name File-fish. The flesh is unwholesome.

Balize. See BELIZE, HONDURAS.

Balkan Peninsula is a usual name for the peninsula in South-eastern Europe running southwards between the Adriatic and the Ægean. The most convenient northern boundary is the Save and the Lower Danube; though historically and politically Roumania and some parts of the Austrian dominions are closely associated with the regions south of the Danube. Greece is a peninsula upon a peninsula, but is not usually accounted one of the Balkan States. In a general way the Balkan Peninsula and Balkan States cover the area of Turkey in Europe and the non-Turkish States either now or lately under Turkish suzerainty, with the exception of Roumania and Greece. By its physical relief and general slope, the peninsula may be said to turn its back upon Europe. Its greatest elevations are found in the west and north-west, and all its waters, flowing north, east, and south, finally empty into the Black Sea or into the Ægean. The mountain chains and masses of the peninsula in no place form a regular system; spreading out from an apparent nucleus in the Etropol Balkans south-east of Sofia, in every direction, they are notable for their great variety of shape and richness of contour. The Balkans proper (ancient *Hæmus*) form the boundary between Bulgaria and Eastern Roumelia. They are highest in the west, where the mean height is 6500 feet. The ridge is crossed by some 30 passes, of which the Shipka, between Kezanlik and Tirnova, and 4290 feet high, is the most noted in history—especially as the scene of severe fighting in the Russo-Turkish war of 1877-78. The mountain-chains in the west of the peninsula have a trend parallel to the shores of the Adriatic and

Ionian seas, whilst in the east, the chief ranges run at right angles to the Black Sea. The small though well-defined chain of the Rhodope (Despoto-Dagh) has a mean elevation of 5500 feet, and forms the water-parting between the Maritza Valley on the north and the Ægean on the south. Muss-alla (9300 feet), in the northern extremity of this range, is the culminating point of the northern portion of the peninsula, but the highest peak is Mount Olympus (9750 feet), north-east of the plain of Thessaly. There are several other ranges—the Dinaric Alps in the north-west, Pindus, between Albania and Thessaly, and the Little Balkans in Bulgaria, running north-east from the main chain; and peaks of from 5000 to 9000 feet occur in nearly every part of the peninsula.

The first place in the hydrographic systems of the peninsula must of course be given to the Danube. The Sea of Marmora receives only a few mountain-torrents, but the drainage area of the Ægean, or Archipelago, comprises the most important river-system of Turkey. The chief rivers—the Maritza, the Kara Su, the Vardar, the Indje—flow from the southern slopes of the Balkans and the crystalline masses of the Rhodope system. Lake Scutari and Lake Ochrida (the latter 2300 feet above sea-level) are the only ones of any size in the peninsula.

Ethnography.—The great highway of western emigration, the Balkan Peninsula still retains a great diversity of races. The oldest inhabitants of the peninsula—the Illyrians—have their representatives in the modern Albanians (Skipetar); the Greeks are there, and have kept their language; the Dacians, who adopted the Roman tongue, are the Rumans or Roumanians of to-day. The Slavonic peoples are of course a large and important section of the population. Of the Turanian settlers, the Bulgars have become a thoroughly Slavonised people; and the Ottoman Turks, who first gained a footing in 1355, conquered nearly the whole of the peninsula before the close of the same century, reduced Greece to subjection between 1455 and 1473, and remained masters to the present century.

According to Reclus, the present territory of the peninsula may be divided into four ethnological zones: (1) Crete and the islands of the Archipelago, the seaboard of the Ægean, the eastern slope of Pindus and of Olympus, are peopled by Greeks; (2) the space comprised between the Adriatic and Pindus is the country of the Albanians (Skipetar); (3) on the NW. the region of the Illyrian Alps is occupied by Slavs, known under the different names of Serbs, Croats, Bosnians, Herzegovinians, and Chernagorans (Montenegrins); and (4) the two slopes of the Balkans proper, the Despoto-Dagh, and the plains of Eastern Turkey, belong to the Bulgarians—a Slavonised Turanian people, now practically Slavs. The Turks themselves are scattered here and there in more or less considerable groups, chiefly round the cities and strongholds; but the only extensive tract of country of which they are, ethnologically speaking, the possessors, is the south-eastern angle of the peninsula. As to the relative numbers of these varied elements, there is considerable diversity of statement—each stock trying to prove its ethnical predominance in debatable ground. In 1885 the statistical bureau in Belgrade reckoned that in European Turkey (*without* Roumania, Servia, or Montenegro) there were 1,362,000 Turks—not pure Osmanli, but largely descended from renegade Greeks and Bulgarians; 1,137,000 Greeks; 1,011,000 Albanians, of whom 723,000 are Mohammedans; 200,000 Walachians; 1,388,000 Serbs; 2,877,000 Bulgarians, of whom 860,000 are Mohammedans; 100,000 Armenians; 70,000 Jews; 104,000 Gipsies; and 144,000 Circassian immigrants.

The home of so many diverse races, the peninsula has long been a hotbed of warring interests, inter-tribal jealousy and intrigue, political tyranny and disturbance, and mutual maltreatment. The Turk's hand may summarily be said to be against every man's hand, and every other against the Turk. Greeks and Bulgarians intrigue each against the other with Russia, and look on the inheritance of the peninsula as exclusively theirs by right. Bulgarian and Serb, though cherishing the Slavonic name, met in the bloody campaign of 1885-86. Macedonia in especial is demanded alike by Greek, Bulgar and Serb. And the case is further complicated by the hostile faiths—Latin Christianity, Greek Church both Orthodox and United, and Mohammedanism. Hence it is easy to infer the last degree of unstable equilibrium in the political sphere, and to understand why the peninsula is a perpetual focus of the insoluble 'Eastern Question,' and a cause of disquietude to all the powers of Europe. Russia wars with Turkey; Austria and Russia have diametrically opposed interests as regards the Lower Danube, and in Austria itself, Hungarian and Slav take opposite sides as to the Southern Slavs; France and Britain are frequently in rivalry at the Porte; and the mutual suspicions of Russia and Britain are constant and notorious.

The following table, compiled from official returns, gives the area and population of the different parts of the Balkan Peninsula:

Political Divisions.	Area in English sq. miles.	Population.
Immediate Possessions of Turkey in Europe.....	63,875	4,500,000
Bulgaria (tributary principality).....	24,699	2,007,919
Eastern Roumelia (autonomous province).....	18,961	976,100
Bosnia.....	(In the occupation of Austro-Hungary)	1,336,091
Herzegovina.....		
Novi-Bazar.....	23,577	168,000
Total, Turkey in Europe..	126,012	8,988,110
Servia (kingdom).....	18,757	1,902,419
Montenegro (principality).....	3,486	250,000
Total, Balkan Peninsula..	148,255	11,140,529

Greece, with the aid of the Great Powers, obtained her independence in 1836, as also did Servia in 1830-67. Walachia and Moldavia (now united in the kingdom of Roumania) were made tributary principalities by the Peace of Paris, 1856. Roumania and Servia obtained their complete independence by the Berlin Treaty of 1878—the former receiving the Dobruja in exchange for a portion of Bessarabia, which was restored to Russia; the latter having its area enlarged. The same treaty handed over to Austro-Hungary the administration of Bosnia and Herzegovina, and established the principality of Montenegro, the principality of Bulgaria, and the self-governing province of Eastern Roumelia. See Von Huhn, *The Struggle of the Bulgarians* (Eng. trans. 1886); De Laveleye, *La Péninsule des Balkans* (Eng. trans. 1887); Rustow, *La Question d'Orient* (trans. by Reynaud, 1887), and the articles in this work on TURKEY, GREECE, BULGARIA, &c.

Balkh, a district of Afghan Turkestan, the most northerly province of Afghanistan. It was for some time subject to the Khan of Bokhara. It corresponds to ancient Bactria, and lies between 35° and 37° N. lat., and 64° and 69° E. long. It is bounded on the N. by the river Oxus, on the E. by Badakhshan, on the S. by the Hindu-Kush, and on the W. by the desert. Offsets of the Hindu-Kush traverse it in a NW. direction, and slope down to the low steppes of Bokhara. Its length is 250 miles; its breadth, 120. Its situation was once important during the overland commerce between India and Eastern Europe before the sea-

route by the Cape of Good Hope was followed. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation; and such are the vicissitudes of climate, that where grapes and apricots ripen in summer, and the mulberry-tree permits the cultivation of silk, in winter the frost is intense, and the snow lies deep on the ground. The natives are Uzbeqs (q.v.), whose character differs in different districts.

BALKH, long the chief town, situated in a district intersected by canals and ditches, by means of which the waters of the Balkh-ab, or Dehâs, are dissipated and prevented from flowing towards the Amu-Daria, only 45 miles distant. It is surrounded by a mud wall; but though bearing the imposing title of 'mother of cities,' it has not in recent times had any of the grandeur of ancient Bactra, on the site of which it is built. It was twice destroyed by Genghis Khan and Timur. A terrible outbreak of cholera in 1877 caused the capital of Afghan Turkestan to be transferred to Mazar, west of Balkh; since which Balkh has been an insignificant village. West of Balkh are the petty Uzbek states of Maimana, Andkholi, Akcha, and Shibarghan, all absolutely ruled by Kabul, except Andkholi; east of Balkh, between it and Badakhshan proper, are the towns and khanates of Kunduz and Khulm. All these Uzbek khanates are in the basin of the Amu-Daria, and together with Wakhan, east of Badakhshan, constitute Afghan Turkestan (see map of AFGHANISTAN).

Balkhash' (Kirghiz *Tengis*; Chinese *Sihai*), a great inland lake near the eastern borders of Russian Central Asia, between 44° and 47° N. lat., and 73° and 79° E. long. Lying 780 feet above sea-level, it extends 323 miles WSW.; its breadth at the west end is 50 miles, at the east from 9 to 4 miles; the area is 8400 sq. m. The water is clear, but intensely salt. Its principal feeder is the river Ili. It has no outlet. The northern edge is well defined; but the southern shores of the lake are labyrinths of islands, peninsulas, low sandhills, and strips of shallow water. Here grow masses of enormously tall reeds, in which wild swine shelter. To the south, stretching towards the base of the Ala-tan Mountains, is a vast steppe, almost devoid of vegetation. Balkhash seems to have at one time included in its immense area the smaller lakes Sossik-kul and Ala-kul, now far to the south-east. For the physical geography of this region, see ASIA.

Ball, JOHN, a priest who was one of the leaders in the rebellion of Wat Tyler (q.v.).

Ball, SIR ROBERT STAWELL, LL.D., F.R.S., astronomer, was born in Dublin, 1st July 1840, and studied at Trinity College. He was appointed Lord Rosse's astronomer at Parsonstown in 1865; professor of Applied Mathematics and Mechanics at the Royal Irish College of Science in 1873; and in 1874 professor of Astronomy at Dublin, and astronomer royal for Ireland. He has published works on mechanics and astronomy, of which the best known is *The Story of the Heavens*, besides many magazine articles, and is well known as a lecturer. He was knighted January 25, 1886.

Ball. Games with balls were among the most favourite gymnastic exercises of the ancients. They were played almost daily by all, young and old alike; by the highest statesman equally with the lowest of the people. The Greeks prized the game as a means of giving grace and elasticity to the figure; and in their gymnasia, as in the Roman baths, there was a special compartment for ball-playing, where certain rules and gradations of the exercise were to be observed according to the state of health of the player. The balls were of very various kinds; they were

generally of leather, and filled with air; others were stuffed with feathers. Ornamented balls, composed of twelve differently coloured segments (such probably as are to be seen in modern toy-shops), are mentioned in Plato's *Phædo*. There was great variety in the kinds of game, each having a name. In one, the ball was thrown up, and the players strove who would catch it as it fell; another was the same as our football; in a third, a number of persons threw it at one another, either with a view to hit, or for the ball to be caught and returned; in a fourth, the ball was kept rebounding between the earth and the palm of the player's hand as often as possible. Ball-playing seems to have been of equal antiquity in the west of Europe, and to have come down uninterruptedly to modern times. In the 16th century it was in great favour in the courts of princes, especially in Italy and France. Towards the end of the 18th century it went out of fashion in the higher circles of continental society, though it is still practised by the people in Italy and Spain, nowhere with more enthusiasm than among the Basques at the base of the Pyrenees. Forms of it, more or less practised, and all of them separately noticed, are *Base-ball*, *Cricket*, *Croquet*, *Fives*, *Football*, *Golf*, *Lacrosse*, *Lawn-tennis*, *Polo*, &c.

Ball. See CARTRIDGE, SHOT.

Ballabgarh, a town of India, the former capital of a native state of the same name, in the Punjab, 21½ miles S. of Delhi. It contains a palace and several temples, and has a trade in food-grains. Pop. 7000.

Ballachu'lish, a village of Argyllshire, on the south shore of salt-water Loch Leven, 16½ miles S. of Fort-William. Its celebrated quarries of blue roofing clay-slate, commenced about 1760, employ some 600 men. The annual production amounts in a busy year to 17,000,000 roofing-slates, weighing about 30,000 tons. Pop. of the village (1881) 1019.

Ballad. The word ballad is derived through the medium of French from the late Latin *ballare*, 'to dance,' and thus meant originally a song sung to the rhythmic movement of a dancing chorus—a dramatic poem sung or acted in the dance, of which a kind of survival is seen in the ring-songs of children's games at the present day. Now the name is sometimes applied to a simple song, usually of a romantic or sentimental nature, in two or more verses, each sung to the same melody—a form the permanent popularity of which is proved by the crowded audiences at modern 'Ballad Concerts' in London and elsewhere. Such a ballad, as distinguished from a song, has something of the narrative or dramatic; and, however difficult it may be to bring to an exact definition examples on the border-line between the two, this distinction is not obsolete even in the musical world, in spite of modern looseness of phrase. But in literature the name ballad means more particularly a simple, spirited, narrative poem in short stanzas of two or four lines (without counting the burden or refrain), in which a story is told in straightforward verse, often with great elaborateness and detail in incident, but always with graphic simplicity and force. The expression is marked by an artless naïveté and unconsciousness of art—it aims to be merely the perfect and living impress of the reality which it represents. Of all narrative and lyrical forms it is the simplest and most direct in its effect, in its power of representing to the imagination with vividness and truth incidents or natural emotions which it attempts to portray. It deals with the elemental human emotions, and its success as a literary form depends upon the potency with which these are sympha-

thetically revived within the imagination of the hearer or the reader. It is obvious that such a form of literary expression is best fitted to a simple and unlettered age, and it is equally obvious that in an age of greater refinement and complexity in the conditions of social and intellectual life, it is difficult, if not impossible, for an artist so to divest himself of the effects of his environment as to reproduce it without affectation and unreality. And this is exactly what we find when we turn to contrast our traditional ballad poetry with the productions of the modern imitative school. Fine poetry though much of its work may be, we feel instinctively that it lacks the spontaneity and genuineness of the antique, the true simplicity born of the absence of self-consciousness—out of the singer's capacity for forgetting himself in his song. We can no more recover the naïveté of the early singers than the grown man can recover the simplicity of the child. But from singers who are wise enough to follow the analogy of nature in her continual advancement to new varieties from antecedent types, we may look for work which, while preserving the traditions of preceding times, will yet represent genuinely the spirit of its own, and save to us all the gains of culture and refinement which the generations have brought us, with something of the earnestness and reality of former days. Coleridge's *Rime of the Ancient Mariner*, Tennyson's *Revenge*, Browning's *Heret Riel*, and Rossetti's *King's Tragedy*, preserve the best traditions of the ballad, while they are as genuine nineteenth-century poems as *In Memoriam* or the *Ode to a Nightingale*.

Our traditional ballads, then, stand by themselves, and bear upon their face the best evidence of their age. Their makers were not authors by profession, and it is natural that their names should be forgotten. Of course, ballads may have been written by men of any class, especially at a time when all audiences were unlettered and alike in taste, and the possession of literary culture was not the separating line that it is at present. For example, the Spanish romances, which are indeed not a little exceptional, and to be distinguished from the ballads resembling ours still traditional in Spain, are clearly the work of men above the vulgar. Nowhere perhaps has there been a richer growth of really popular ballads than in Sicily, where Pitre tells us as many as seven thousand examples have already been gathered. Here the bulk of the population still stands at that ballad stage which in the evolution of our national culture we Englishmen have already left several generations behind us. Our ballads were made by the people for the people, and they went straight to the hearts of their hearers, who, if they lacked the refinement of their successors, were not less quick to feel the hot human emotions—love, hate, pity, and fear. They were versified originally by unlettered men for unlettered audiences; and passing as they did from mouth to mouth and generation to generation of reciters possessing the literary sense in very varying degrees, it is not wonderful that many changes of omission or alteration have slipped in, and that what are really the same ballads are found in versions differing considerably from each other. Personal tastes and prejudices would interfere, while accidentally discovered felicities of thought or phrase would often occur, and be added to the recited poems by individual reciters, so that it might be wondered at that the differences of versions are not much greater than they are. The ballads must have gained in strength in the course of transmission, as the happy changes would stand and live in the memory, while the feebler words and verses would fall aside and disappear. Molière's old housekeeper had as true a sense for felicity

of expression as the ladies of the court; so the instincts of the people guided the reciters to the choice of the best word, and when it was found, their memories retained it. But unfortunately the process of transmission has not always been synonymous with a process of refinement or improvement, but has often weakened and spoiled as well as strengthened and amended. Especially is this true with the ballads of the southern English folk, which too frequently are flat, spiritless, and didactic, totally unlike the Scottish and north-country English ballads. The reader cannot fail to be struck by this particularly in the Robin Hood ballads, where so much that is beautiful and artistic alternates awkwardly with the bald and prosy verbiage of the mere rhymester. 'The loyalty, good-humour, and the love of the free air and the green-wood remain, but the clerks have spoiled the praise of Robin Hood, the good outlaw.' Perhaps this is in great measure due to the early printing of much of the English popular poetry in the form of broad-sheets. These were subjected by half-educated editors and printers to a kind of preparation for the press which too often succeeded in stripping the poor ballads of almost all their poetic charm. The printed ballads were scattered broadcast over England, and often pasted on the walls of chambers in country-houses, where they were sometimes fortunate enough to catch the eye of a reader whose sympathies ranged wider than his culture. 'I cannot, for my Heart,' says *The Spectator* (No. 85), 'leave a Room before I have thoroughly studied the Walls of it, and examined the several printed Papers which are usually pasted upon them;' and he describes further how that on a wall he found 'the old ballad of *The Two Children in the Wood*, which is one of the darling songs of the common people.' The people 'love a ballad but even too well, if it be doleful matter merrily set down, or a very pleasant thing indeed and sung lamentably,' and Mopsa's preference for a ballad in print, 'for then we are sure they are true,' may be taken as expressing a not uncommon popular feeling. Indeed the whole passage referred to (*Winter's Tale*, IV. iv. 181-330) throws great light on the subject of the old broadsides, and the warm liking of the people for them. These printed broadsides were long as dear a solace to the southern rustic as the traditional ballads were to his fathers, though by passing through a series of unintelligent and unsympathetic recensions many of them had become so bald as to deserve Dr Johnson's parody:

I put my hat upon my head, and went into the Strand,
And there I saw another man, with his hat in his hand.

In our traditional ballads we must not look for exact dates; but there is ample evidence that a large part of our traditional ballad poetry existed in much the same form as now, more than three hundred years ago. Many of the themes, of course, are much older, and undoubtedly many of the versified ballads also. Already in *The Vision of Piers Plowman* (Skeat's ed., C. Passus viii. 10-12), in the second half of the 14th century, we find Robin Hood a hero of popular song. Skelton says:

Ich can nouht partylliche my pater-noster as the prest hit seggeth,
Ich can rymes of Robyn Hode, and of Randolf, and of Chebrey,
As of our lord ne of our lady, the lest that ever was makid.

Barbour tells us (*The Brus*, book xvi. 520-22, Skeat's ed.; xi. 524-26, Jamieson's ed.) that he thinks it unnecessary to rehearse the account of a victory gained in Eskdale over the English, because:

For quha as likis, that may heir
Young women, quhen that will play,
Syng it emang thame like day.

Leslie, in that chapter in his *History of Scotland* (1594) devoted to the Border manners, notices par-

ticularly the taste of the marchmen for music and ballad poetry. But we need not suppose that the only ballads they cared for were those of battle and bloodshed. Their rude and turbulent lives, full of danger and death, had in them the elements of rare romantic interest, and the pity of life must ever have been present to them as a rich artistic motive that would inspire the poetry of passion and pathos, of despair, or hopeless and interrupted love.

But our popular poetry was for generations the possession of the people alone: it was long before it attracted the notice of the learned at all. Shakespeare knew the old romantic ballads, and worked snatches of them with fine effect into his dramas. Sir Philip Sidney could say: 'I never heard the olde song of Percy and Douglas that I found not my heart moued more then with a Trumpet: and yet is it sung but by some blinde Crouder, with no rougher voyce, then rude stile.' Ben Jonson used to say he would rather have been the author of it than of all his works; and Addison commended the 'majestic simplicity' of the same ballad in two fine papers of his *Spectator* (70 and 74). Yet the ballads continued to be neglected, and it was not till Bishop Percy published his famous *Reliques of Ancient English Poetry* in 1765, that Englishmen awakened to the fact that their popular poetry was poetry at all. Among the ballads in this collection were such masterpieces as 'Childe Waters,' 'Glasgerion,' 'Edom o' Gordon,' 'Edward, Edward,' 'The Jew's Daughter,' 'Old Robin of Portingale,' 'Sir Aldingar,' 'King Estmere,' 'Sir Patrick Spens,' and 'Gil Morice.' Percy admits in his preface that he had made 'a few slight corrections or additions,' as the old copies were 'often so defective and corrupted, that a scrupulous adherence to their wretched readings would only have exhibited unintelligible nonsense, or such poor meagre stuff as neither came from the bard nor was worthy the press.' Perhaps no book ever had a greater or more immediate effect. 'I do not think,' says Wordsworth, 'that there is an able writer in verse of the present day who would not be proud to acknowledge his obligation to the *Reliques*.' The same return to the simplicity of truth and nature took place about the same time in France and Germany, and ere long showed its results as plainly in the lyrical work of André Chenier, of Goethe, Schiller, and Heine. From the *Reliques* Scott drew directly the inspiration that made him a poet and more. In 1802 appeared at the provincial press of Kelso the first two volumes of his *Minstrelsy of the Scottish Border*, the richest single collection of popular poetry that has ever been published. From the publication of this book the northern ballads permanently took their place in public estimation as one of the best and purest sources of English poetry. It was fortunate for English literature that the Border ballads secured, before it was too late, an editor in whom the antiquary had not drowned the poet. Many of the poems were the fruit of raid after raid into Liddesdale, and were in part actually taken down from the living lips of the old men and women who still knew them by heart. It may be regretted, from the point of view of the scientific student, that Scott did not print his texts exactly as he got them, but reference to his originals is possible in some cases, and shows us that Scott's changes—not always for the better—were not by any means so great as might be supposed. Of course, in many cases it is impossible now to say exactly how much they owe to the poetic touch of Scott himself, and we know that it was possible for him to be taken in by ingenious friends; still there is proof enough that here we have what is substantially a body of traditional poetry that fulfils the strictest

conditions of the ballad, and is yet of uncommonly high poetic value. The influence which Percy's and Scott's ballads have had on poetry is enough to prove their intrinsic poetic power: their straightforward diction and artless melody at once became a powerful influence in literature, and made themselves felt in the work of Coleridge, Wordsworth, Keats, Tennyson, Rossetti, and indeed every succeeding poet. Even the zeal of later imitative poetasters, however little according to knowledge, is a tribute to the poetic influence of the form that dominated them, although it did not save them from those faults of obscurity and quaint vagueness of expression, looseness of versification, and inaccuracy of accent, which not unfrequently accompany the merits of the model. Succeeding editors added to Scott's work, Robert Jamieson printing in his excellent collection in 1806 as many as fifteen ballads not before published: among them, 'Burd Helen,' 'Willie and May Margaret,' 'Young Beichan,' and 'Alison Gross.' Motherwell's originals, printed in 1827, were of less value, but many of his alternative oral versions were interesting and important, while his learned introduction contained a good survey of the subject, full of the indignant eloquence of the warm apologist, as well as the sympathetic insight of the poet. Peter Buchan's collection, published in 1828, professed to give north-of-Scotland popular versions, which were discovered to be strangely bald in style, and barren of poetic quality. In the hands of the later editors, the proportion of dross to ore grew larger with each collection, while the modern arts of life killed the conditions which propagated and preserved the ballad. The work of many of the later ballad editors showed no little erudition, though some evidently had more care for the cobweb than relish for the wine. Whether the incidents recorded are historical or legendary, or whether they are partly both; whether the ballads belong to the 16th, or 15th, or any particular century; whether Lady Wardlaw, or any one else, ever added a line, or left one out, are after all questions of but little moment to the Englishman proud of possessing the richest body of popular poetry in the world, and which bears upon its face, in the impossibility of its being imitated, the only evidence of genuineness and antiquity worth anything at all.

Still less important look the discussions of the editors in the light of the results gained from the comparative study of folk-songs. We find that many of our traditional ballads have the same tone, the same incidents, the same iterations of words and ideas as the traditional ballads of Scandinavia, of Greece, of Germany, of Italy, of France, and of Spain. This discovery widens our interest in the question enormously. It strips it of something of its parochial and national interest, but it adds an interest to it that is conterminous with our civilisation itself. The plots and situations of many of our traditional folk-songs are the immemorial inheritance of Celts and Saxons, of Greek and Slavonic peoples—of unknown and prehistoric antiquity. Like our folk-tales, they do not belong to one nation in particular, but are the property at least of all the peoples of the Aryan family. 'There are certain incidents,' says Mr Lang, 'like that of the return of the dead mother to her oppressed children; like the sudden recovery of a fickle bridegroom's heart by the patient affection of his first love; like the adventure of May Colvin with a lover who has slain seven women, and tries to slay her; like the story of the bride who pretends to be dead, that she may escape from a detested marriage, which are in all European countries the theme of popular song.' Ballads, of course, have a narrower range than tales. There is here and there a trait common to Europe and Asia,

but the ballads are substantially European. Each nation has a set of its own—not always large—besides the stock in common. It is idle, then, to quarrel any longer over the origin and authorship of these ballads. It is still true, of course, that we have some more or less historical ballads, and that even our purely romantic and non-historical ballads have been powerfully modified by local influences; but the fact remains that a large number of our ballads, and many of their characteristic incidents and qualities, though not their literary style, are not due to the poetic instincts of our own countrymen in particular, but were carried scores of centuries ago in the memories of our distant progenitors from the primeval home of our race. They form part of the stock of primitive folk-lore, and a study of them on the comparative method may be expected to lead to important constructive results in the hands of future scholars. The materials for such study will be placed for the first time in the hands of every student on the completion of Professor Child's monumental edition of the *English and Scottish Popular Ballads* (Parts I.-IV. 1882-86), with its learned and luminous introductions to each ballad, culled from a thousand volumes in every language of Europe.

But entirely apart from questions of origin, our popular ballads will repay the most diligent study on their literary side alone. As works of art in which a stock of primitive ideas and incidents has been preserved in poetic dress, they form a perennially valuable portion of our literature, and, as has been shown, they formed the chief factor in that naturalistic reaction from which has flowed the richest stream of nineteenth-century poetry, not yet exhausted after a hundred years. The Robin Hood cycle of ballads and the north-country and Border ballads are the two largest and richest collections of ballad poetry that remain to us; but as has been proved, the latter is infinitely the higher in lyrical quality. The Robin Hood ballads are some forty in number, but include much repetition both of phrase and incident. More than half a dozen are variants of the same story of Robin's meeting an unknown traveller—a tinker, butcher, tanner, shepherd, curtail friar, or beggar—straightway fighting with him, being beaten, and then, in good-humoured admiration of his antagonist's prowess, at once enlisting him in his band of honest outlaws. Among the best ballads of the group are 'Robin Hood and Guy of Gisborne' and 'Robin Hood and the Monk,' the last a good and right spirited heroic tale. The *Lyttell Geste* is a set of eight connected ballads, grouped for us by some early and not unskilful editor. 'If these ballads as a whole be tedious,' says Mr Allingham, 'the central figure (whithersoever or howsoever come) is a clear and delightful one, of that small class of ideal personages to which Don Quixote and Robinson Crusoe also belong—a bold, generous, and courteous outlaw, famous in archery, living under greenwood-tree with his merry men, taking from the rich and giving to the poor—a figure that, once lodged in the popular imagination, became an easy and favourite subject for one rhymester after another.' Of all our ballads, the palm for poetry must be given to those especially connected with Scottish and English Border life and story. These formed the richest part of Scott's collection, which contained altogether more than forty ballads never published before, among them such masterpieces as 'Thomas the Rhymer,' 'The Dowie Masters o' Yarrow,' 'The Wife of Usher's Well,' 'Annan Water,' 'The Douglas Tragedy,' 'The Lament of the Border Widow,' 'Clerk Saunders,' 'The Sang of the Outlaw Murray,' and 'Kinmont Willie'; as well as good fresh versions of 'Lord Randal,' 'Helen of Kirkconnell,' 'Tamlane,' and 'The Lass o' Lochryan.'

'Kinmont Willie' can hardly be overpraised as a masterpiece of the heroic ballad, unequalled in fire and speed. The reader is carried along in a whirl of sympathetic excitement, and is left no time to wonder at the marvellous fitness and truth of the words and images. Fighting ballads like this have high historical as well as poetical value, for they reflect closely and accurately the manners and life of the particular people who produced them; and doubtless they had their influence on the rude people who preserved them. The paradox of Fletcher of Salton occurs to the memory, and may be admitted to contain at least some measure of truth: 'I know a very wise man that believed that if a man were permitted to make all the ballads, he need not care who should make the laws of a nation.' Some of the fighting ballads of the Border are so vivid and vigorous that we feel the singer had himself ridden in the foray, had heard with his own ears the very clash of steel; nor indeed need the minstrel have struck a feebler blow because he had an ear for ballad metres. The old Border life was rough and rude, but the blood-stains on its grassy holms have watered for us flowers that are among the rarest in the garden of English song. Above all our ballads in value stand those that have clustered round the Yarrow—'fabulous as was ever Hydaspea.' Its story of love stronger than death has been one of the most potent charms in the world of English poetry, and has drawn some of the finest verse that has ever been written from Hamilton of Bangour, Logan, and Wordsworth.

The best collection of ballads, in all their varying versions, will be, when finished, Professor Child's great work; the best meantime is that of the same editor (8 vols. Boston, 1857-59). A good anthology, with a suggestive introduction, is that by William Allingham (1868); and a serviceable and comprehensive collection is *The Ballad Minstrelsy of Scotland, Romantic and Historical* (Glasgow, 1871). The most important individual collections have been: *A Collection of Old Ballads* (3 vols. Lond. 1723-25); Percy's *Reliques of Ancient English Poetry* (3 vols. 1765; a beautiful and excellent ed. by H. B. Wheatley, 3 vols. 1886); Herd's *Ancient and Modern Scottish Songs, Heroic Ballads, &c.* (1769; 2 vols. 1776); Johnson's *Scots Musical Museum* (6 vols. 1787-1803; 3d ed. by Stenhouse and David Laing, 4 vols. 1853); Ritson's *Robin Hood: a Collection of all the Ancient Poems, Songs, and Ballads now extant, relative to that celebrated English Outlaw* (2 vols. 1795; re-edited by Gutch, *A Lyttell Geste*, 2 vols. 1847); Scott's *Minstrelsy of the Scottish Border* (3 vols. 1802-3, with its admirable introduction and notes); Robert Jamieson's *Popular Ballads and Songs* (2 vols. 1806); Kinloch's *Ancient Scottish Ballads* (1827); and Motherwell's *Minstrelsy, Ancient and Modern* (1827), with an excellent introduction.

Other collections, but of less importance, are Thomas D'Urfey's *Pills to Purge Melancholy*, containing a ballad here and there (6 vols. 1719-20); Allan Ramsay's *Evergreen* (2 vols. 1724), and *Tea-table Miscellany* (3 vols. 1724-27; afterwards augmented with a fourth volume); Pinkerton's *Select Scottish Ballads* (2 vols. 1783); Ritson's *Select Collection of English Songs* (1788), *Pieces of Ancient Popular Poetry* (1791), *Ancient Songs and Ballads* (2 vols. 1792), and *Scottish Song* (2 vols. 1794); Finlay's *Scottish Historical and Romantic Ballads* (2 vols. 1808); Thomas Evans's *Old Ballads* (2 vols. 1777; enlarged ed. by R. H. Evans, 4 vols. 1784); Gilchrist's *Collection of Ancient and Modern Scottish Ballads* (2 vols. 1815); Hogg's *Jacobite Relics* (2 vols. 1819-21); David Laing's *Select Remains of the Ancient Popular Poetry of Scotland* (1822); C. K. Sharpe's *Ballad Book* (1824); Maidment's *North Country Garland* (1824); Kinloch's *Ballad Book* (1827); P. Buchan's *Ancient Ballads and Songs of the North of Scotland* (2 vols. 1828); Dr Robert Chambers's *Scottish Ballads* (1829); Whitelaw's *Book of Scottish Ballads* (1845); J. F. Collier's *Book of Roxburgh Ballads* (1847); Aytoun's *Scottish Ballads* (2 vols. 1857); and Maidment's *Scottish Ballads* (2 vols. 1868).

The publications of the Percy Society embraced 30 vols. (1840-52), a few of them pertaining to ballads. Indispensable books are Chappell's *Popular Music of the Olden Time* (2 vols. 1855-59), and Hales and Furnivall's reprint of the *Percy Folio Manuscript* (3 vols. 1867-68), in which we get behind the good bishop, and see his conception of an editor's duty, and how well on the whole he deserved the wrath of the surly but honest Ritson. It was a surprise to the world to discover that of his 180 ballads, there were only 45 that Percy had taken from his famous manuscript. In 1868 Mr Furnivall succeeded in founding the Ballad Society, which has since published, mainly under the enthusiastic and untiring editorship of Mr Emsworth, the Bagford ballads, the Roxburgh ballads almost entire, and other unprinted collections. The great collection of ballads made by the famous Pepps is still remains buried in the library of Magdalen College, Cambridge.

For comparative study may be named the following collections: For France, E. Rolland's *Recueil de Chansons Populaires* (6 vols. 1883-88); for Denmark, Svend Grundtvig's *Danmark's Gamle Folkeviser* (Copenhagen, 1853-90); for Germany, F. K. von Erlach's *Die Volkslieder der Deutschen* (5 vols. Mannheim, 1834); for Italy, Giuseppe Pitre's *Canti Popolari Siciliani* (2 vols. Palermo, 1870); and for Spain, Francisco Rodriguez Marin's *Cantos Populares Españoles* (Seville, 5 vols. 1882-84). See also Countess Martinegro-Cesaresso's *Essays in the Study of Folk-songs* (1886), and most of the sixty-nine books named in her list of books consulted.

See Alexander Smith's 'Scottish Ballads' in *Edinburgh Essays* (1856); Mr Hewlett's 'Modern Ballads' in the *Contemporary Review* for November 1875; Andrew Lang's article in vol. iii. (1875) of the 9th edition of the *Encyclopædia Britannica*, and his introduction to the selection of ballads in vol. i. (1890) of *The English Poets*, ed. by T. H. Ward; Professor Veitch's *History and Poetry of the Scottish Border* (1878), especially chap. x.; and chap. xiv. of John Russell's *Haigs of Bemersyde* (1881), for an excellent survey of the social conditions of old Border life.

Ballade, a term applied to a poem consisting of one or more terns or triplets of seven- or eight-lined stanzas, each ending with the same line as refrain, and usually an envoy, as Chaucer's *Compleynt of Venus* and *To his Purse*. The foregoing is the strict application of the term—it is now frequently used somewhat more loosely of any poem divided into stanzas of equal length. This form, which was a favourite of Villon and many of the older French poets, has been revived by De Banville, Swinburne, Andrew Lang, Austin Dobson, and other recent poets.

Ballanche, PIERRE SIMON, a French philosopher, was born at Lyons, 4th August 1776, and settled at Paris in 1814, having attracted some notice by his essays and a prize poem, *Antigone*. His great work is the *Palingénésie Sociale* (1828), in which he seeks to illustrate the workings of God in history, and sketch how human society may and will be reconstructed so as to attain to its highest development. His works are a strange mixture of mysticism, socialism, and the philosophy of history. His *Vision d'Hebal* (1832) is a prophetic forecast of the world's history, Hebal being a second-sighted chief of a Scottish clan. Ballanche, who was a member of the Academy, died 12th June 1847. See his *Life* by Ampère (1848).

Ballantine, JAMES (1808-77), artist and poet, born in Edinburgh, was brought up as a house-painter, but afterwards learned drawing under Sir William Allen, and was one of the first to revive the art of glass-painting. He was commissioned to execute the stained-glass windows for the House of Lords, and in 1845 published a treatise on *Glass Staining*, which was translated into German. Two prose volumes, *The Gaberlunzie's Wallet* (1843), and *Miller of Deanhaugh* (1845), contain some of his best known songs and ballads. He was author of *Poems* (1856 and 1865); *One Hundred Songs with*

Music (1865); *Life of David Roberts, R.A.* (1866), and *Lillias Lee* (1871).

Ballantine, WILLIAM (1812-86), serjeant-at-law, son of W. Ballantine, for many years a magistrate at the Thames Police Court, was called to the bar in 1834, and soon obtained a large practice, chiefly in criminal cases. He was created a serjeant in 1856. Amongst the famous trials with which he was associated were the Müller murder trial, Tichborne case, and the defence of the Guicowar of Baroda. From the latter he is said to have received a fee of 20,000 guineas to induce him to visit India. See his *Experiences of a Barrister's Life* (1882); and his *Old World and the New* (1884), an account of a visit to America.

Ballantrae, a fishing-village at the mouth of the Stinchar, in the S. of Ayrshire, 10 miles WSW. of Pinwherry station on the Girvan and Portpatrick Railway. It is the headquarters of the south-west fishery district of Scotland. Fishing is largely carried on. Pop. (1871) 515; (1881) 742.

Ballantyne, JAMES (1772-1833) and **JOHN** (1774-1821), Scott's printers, were the sons of a merchant of Kelso, where in 1783 they were both at school with Sir Walter. James was bred for the law, but in 1797 he started the Tory *Kelso Mail*; and in 1802, having already printed some ballads for Scott, he produced the first two volumes of the *Border Minstrelsy*. The beauty of their typography established his fame as a printer; and towards the close of that year he removed, at Scott's suggestion, to Edinburgh, and set up two presses near Holyrood. In 1805 Scott became a secret partner in the business, which in 1806 expanded into the printing, publishing, and book-selling firm of John Ballantyne & Co., Scott having one-half share, and each of the brothers one-fourth. 'Aldiborontiphosophornio' and 'Rig-dumfennidoe' were Scott's nicknames for pompous James and sporting John; he seems to have liked them both, though sometimes he might plead 'For heaven's sake, treat me as a man, and not as a milch cow.' As early as 1813, bankruptcy threatened the firm, and though its unsaleable stock (Scott's own rash ventures mainly) was disposed of to Constable in 1818, it was hopelessly involved in Constable's ruin (1826). John had died bankrupt five years earlier; and James, after the settlement of affairs, was employed by the creditors' trustees in editing the *Weekly Journal*, and in the literary management of the printing-office. See works referred to under SCOTT; and *History of the Ballantyne Press* (Edin. 1871).

Ballantyne, ROBERT M., a prolific and popular writer of sound and wholesome tales for boys, was born at Edinburgh in 1825. His first book, issued in 1848, was a record of personal experiences during a six years' residence (1841-47) in the territories of the Hudson Bay Company. In 1856 he took to literature as a profession, making it his aim as far as possible to write from personal experience, and introducing interesting facts and descriptions. His first tales were founded on experiences in the backwoods of Rupert's Land, among the fur-traders and Red Indians; the *Lighthouse* was written after a short residence in the Bell Rock lighthouse; *Erling the Bold*, after a visit to Norway; and *The Settler and the Savage*, after a visit to the Cape. Up till January 1887 he had written and published 74 volumes, of which 62 were distinct tales.

Ballarat, or BALLAARAT, a thriving Australian town, next in importance to Melbourne, in the province of Victoria. It owes its rise to the discovery of the gold-fields there in June 1851, being the oldest of the considerable gold-fields of Victoria,

and in fact the oldest but one of all the gold-fields of the colony. It is 100 miles WNW. of Melbourne, and 58 miles NW. of Geelong, with both of which it is connected by rail. It lies in the centre of one of the richest gold-fields in the world; the geological formation of the district is Silurian on primitive slate and sandstone. Ballarat, or Ballarat West, and Ballarat East, separated by the Jarrowee Creek River, are separate municipalities. The town is lighted with gas, well supplied with water, and has connection with all the other railways in the colony. It is the see of Protestant and Roman Catholic bishops. Many of the shops and public buildings are handsome, and there are more than 80 miles of made streets. Amongst the public buildings are several hospitals, mechanics' institute and library, free public library, city-hall, theatre, two town-halls, over 40 churches, two colleges, several grammar and denominational and many state schools, and 300 inns and hotels. Amongst the industries are iron-founding, brewing, distilling, with flour and woollen mills. Three daily newspapers are published. When the surface diggings became exhausted after the first rush in 1851, deposits of gold were found at greater depths, and now there are mines as deep as some of our English coal-pits, with steam pumping and all the requisite machinery. The miners in 1854 made a stand against unjust taxation, and in the conflict which ensued many lives were lost and much property was destroyed. The 'Welcome Nugget,' the largest ever found, was discovered in 1856 at Bakery Hill. It weighed 2217 oz. 16 dwt., and was sold for £10,500. The 'Lady Hotham,' found near Canadian Gully, weighed 1158 oz. 2 dwt. In 1886 about 7000 men were employed at the gold-fields, 1060 of whom were Chinese. The surrounding district is well adapted for farming and sheep-breeding. Pop. (1881) Ballarat, 22,411; Ballarat East, 14,849; total, 37,260.

Ballast is a heavy substance employed to give a ship sufficient immersion in the water, to insure her safe sailing with spread canvas, when her cargo and equipment are too light. The amount of ballast required by a ship depends not only on her size and cargo, but also on her build; some forms of construction requiring more ballast than others. It is not merely the quantity of ballast which a skilful shipmaster has to consider; he is required also to take into account its distribution. If a heavy mass of ballast be deposited within a small compass near the keel, it locates the centre of gravity very low down, in which circumstances the ship will sail sluggishly, and heavy and uneasy rolling may result, causing discomfort, and engendering severe strains in the hull and rigging. If, on the other hand, the ballast be massed too high up, the ship becomes unstable or 'crank,' and cannot carry much sail without danger of being upset.

In ballasting a ship, the cargo and ballast are considered together, the quantity and distribution of the latter being made dependent on the former. In a ship of war, the ballast is made subservient to the requirements of the necessary stores and war material; in a merchant or passenger vessel, to the efficient storage of the cargo and the comfort of its passengers.

The substances used as ballast are various—chiefly iron, stone, gravel, sand, and water. In ships of any considerable size, or engaged in any service of importance, iron has long superseded stone, gravel, or other variety of dry ballast, but within recent years the adoption of water ballast has become very general in almost all classes of vessels. Its first application, about the beginning of the century, in the ships engaged in the coal-trade between the Tyne and London,

consisted in the use of waterproof bags arranged on the floor of the vessel, which were filled or emptied as circumstances demanded, by pump and hose. When steamers began to be employed in the trade, special ballast tanks, forming part of the vessel's structure, were introduced, which served for cargo carrying, when the vessel was loaded and not requiring ballast. This developed into using the whole extent of a vessel's bottom exclusively for water ballast, a second or inner bottom being fitted two or three feet above the bottom proper. The practice of fitting vessels with double bottoms, divided into cellular spaces by continuous longitudinal keelsons and transverse bracket floors—of which the *Great Eastern* is an early and notable example—had been instituted by Mr Scott Russell between 1850-58. The object then in view, however, was that of enhanced structural strength, but about 1874-78 several vessels were built on the north-east coast of England on the cellular-bottom system, the end in view being chiefly the carriage of water ballast. From that time the system has been continuously and increasingly adopted, its later development having been more closely associated with Clyde-built vessels. Steamers only, for a time, were thus constructed, because of the special pumping facilities they possessed for rapidly emptying the ballast tanks. Within very recent times, however, many sailing-ships have been built with water-ballast bottoms; the presence of steam donkey-boilers, cargo-winches, windlass, &c., in well-equipped modern ships, incidentally furthering the adoption of water ballast. The bottoms of typical modern merchant-steamers are divided into numerous watertight compartments, which can be filled or emptied separately through inlet or suction pipes, by means of pumps worked by the main engines. The system has many advantages which highly commend it. Vessels are ballasted automatically, without any manual intervention further than the opening and closing of the inlet valves. Ballasting may proceed simultaneously with the discharge of cargo, and quite irrespective of that work. It may be discharged also at any time, even while the vessel is under way. The subdivision of the bottom into self-contained compartments admits of ballasting being done either at the fore or the aft end of the vessel, just as may be required for its equal or desired trim. The inner bottom, it may be stated, adds immensely to the safety of the vessel in the event of its striking on sunken rocks.

The customs laws relieve merchant-ships from certain formalities and payments when leaving a port in ballast. To prevent captains from filling up or injuring the entrances to rivers, ports, havens, and roadsteads by the discharge of ballast, regulations have been made at most places for its disposal.

The term ballast is employed by civil engineers to signify the broken stone, cinders, or gravelly material which is laid as a packing between railway sleepers, in order to give them solidity, and at the same time prevent the lodgment of water. No English railway is considered to be complete or safe for transit until it is dressed and finished by ballasting; the bed of ballast being usually about two feet thick. The possibility of procuring ballast at a cheap rate, considerably affects the cost of railway undertakings.

Ballater, a village of Aberdeenshire, Scotland, on the banks of the Dee, 43½ miles WSW. of Aberdeen by rail. It is the resort of numerous visitors, on account of the medicinal springs of Pannanich in the vicinity. Balmoral Castle, the Scottish residence of Queen Victoria, and Ballatrieh Farm, connected with the boyhood

of Byron, are in the neighbourhood. It is the terminus of the Deeside extension of the Great North of Scotland Railway, and is a clean and pleasant village, with an Albert memorial hall, two churches, and barracks for the Queen's guard of honour. Pop (1881) 750.

Ballenstedt, a town in the duchy of Anhalt, in the eastern part of the Harz Mountains, 7 miles SE. of Quedlinburg by rail. The castle, overlooking the town, was a monastery from 940 till 1525, and from 1765 till 1863 the residence of the dukes of Anhalt-Bernburg. Pop. (1885) 4852.

Balleny Islands, a group of five small volcanic islands discovered in the Antarctic Ocean, 1839, nearly on the Antarctic circle, and in long. 164° E. One contains a very lofty mountain.

Ballet (Fr. *ballet*; Ital. *ballo*, from late Lat. *ballare*, 'to dance,' possibly connected with late Greek *ballizein*, 'to throw the legs about, to dance'), a theatrical exhibition, composed of dancing, posturing, and pantomimic action. Both the religious ceremonies of the Greeks, and the dramatic representations which sprang from them, were largely intermingled with Dancing (q.v.); and the Roman pantomimes bore a strong resemblance to our *Ballet d'Action*. In an entertainment given to celebrate the victory of Actium, the *Trachiniae* of Sophocles, and an erotic interlude founded on the myth of Leda, were performed in dumb show, the dancers Pylades and Bathyllus taking the leading parts; and the whole wound up with a Pyrrhic war-dance. Some tradition of this form of entertainment, doubtless, suggested the courtly dances which became fashionable in the early days of the Renaissance. The first on record was that given by Bergonzio di Botta, at Tortona, to celebrate the marriage of the Duke of Milan, in 1489, which was famous throughout the civilised world. From that time great events, such as royal marriages and births, were celebrated by grand productions of ballet on which enormous sums of money were lavished. These ballets were frequently historical in subject, treating of the *Siege of Troy*, the *Conquests of Alexander*, and similar events. There were also mythological, poetical, moral, and fantastic ballets, on such subjects as the *Judgment of Paris*, the *Seasons*, *Truth*, the *Diversions of the Carnival*, &c. All of these were in five acts, each of which consisted of three, six, nine, or twelve entries, and in all of them singing and recitation mingled with the dancing. Catherine de Medicis introduced the ballet into France, and encouraged lascivious dances by females to distract the attention of her son, Henry III., from state affairs. At this time Baltasarini introduced a certain regularity into this kind of spectacle, his most famous production being the *Ballet Comique de la Reine*, danced at the marriage of the Duc de Joyeuse in 1581. Henry IV. was a great supporter of the ballet, no fewer than eighty grand entertainments being given by him between 1589 and 1610. Louis XIII. and Louis XIV. carried their love of ballet to an extreme length, and themselves danced publicly. In 1661 the latter founded an Academy of the Dance, with Quinault as director, and Lully as composer. Quinault introduced considerable changes into the ballet, for he, being a poet, subordinated the dancing to the recitation and singing. It was not till 1681 that female dancers appeared in public, the first being four ladies, who danced in *La Triomphe de l'Amour*. In the early part of the 18th century we begin to meet with the names of professional female dancers, two of the most famous being Mdles Sallé and Camargo, immortalised by Voltaire, the former of whom visited London in 1741, and apparently created a great sensation. The great male dancer of this time was Dupré,

the predecessor of the universally known Gæetano Vestris. In 1697 De la Motte introduced some changes into the ballet, chiefly in the direction of more interesting subjects, and about the same time comic ballets were invented by Danchet; but no important alteration was made till the advent of Jean George Noverre in 1749. In his works, Noverre describes the conditions under which the dancers at this time performed. They wore masks, huge wigs and head-dresses, and, most extraordinary of all, hoops. The mask held its place till 1772, when Maximilian Gardel, a famous dancer, ventured to appear without one. Public conservatism caused a return to the old fashion for some months, but in 1773 the mask disappeared for ever. Noverre completely revolutionised the ballet. Hitherto the form had remained practically unchanged; each act being performed by different dancers, and, generally, in different styles of dancing. Noverre invented the *Ballet d'Action*, and revived the true art of pantomime. Dancing, which had previously been principally an exhibition of agility, now had dramatic meaning, and the most intricate plots were represented by pantomime alone. The principles of Noverre were carried to great perfection by Vincenzo Galleotti in Copenhagen, and by his successor Bournonville. Under the Directory a form of grand ballet was revived, in which patriotic songs were a distinctive feature; *La Marseillaise* being the title of one great ballet. But it cannot be said that the form introduced by Noverre has been improved or even much altered, and the history of the ballet since his time is a history of dancers, rather than of dancing. In England this class of entertainment has never been more than an exotic, and has practically no history. The word *balette* is first used in English by Dryden (1667), and the earliest attempt at a descriptive ballet seems to have been *The Tavern Bilkers*, played at Drury Lane in 1702. It is worthy of note that within the last few years an important revival of the ballet has taken place in Italy, where the famous *Excelsior*, by the Chevalier Luigi Manzotti, *Messalina*, *Amor*, &c., have furnished magnificent examples of the *Ballet d'Action*.

Ball-flower, so named from its resembling a ball placed in a circular flower; an ornament peculiar to the decorated style of Gothic architecture which prevailed in the 14th century. The ball-flower is supposed by some to be an imitation of a pomegranate, by others of a hawk's bell. Its form will be better understood from the illustration.

Ball-flower.

Ballina, a seaport town on the confines of counties Sligo and Mayo, Ireland, on the tidal Moy, 7 miles S. of its entrance into Killala Bay, and 168 miles NW. of Dublin by rail. Ballina proper is on the Mayo side, the Sligo and larger portion being a suburb called Ardnaree, in which are the Protestant church and Roman Catholic cathedral (that of the Bishop of Killala). Ballina is the first town in County Mayo, and has a trade in agricultural produce. Many anglers resort to the river Moy and Lough Conn. In 1798 the French landed, and took Ballina, but were three weeks afterwards defeated at Killala. Pop. (1871) 5551; (1881) 5760.

Ballinasloe, a small town in Connaught on the borders of counties Galway and Roscommon, on both sides of the river Suck, 94 miles W. of Dublin. A fair in October is one of the largest in the kingdom. Pop. (1881) 4772.

Ballinrobe, a small town of Ireland, County Mayo, picturesquely seated on the Robe, 17 miles SSE. of Castlebar. Pop. (1881) 2286.

Ballista, or BALISTA (Gr. *ballein*, 'to throw'), a Roman military engine, resembling a huge bow, which, like the *catapulta* and the *onager*, propelled large and heavy missiles, chiefly through the reaction of a tightly-twisted rope of hemp, flax, catgut, sinew, or hair, or else by a violent

Ballista.

movement of levers. Numerous weapons of an analogous character were known in the middle ages—such as the *mangonel*; the *trebuchet*, the *robinet*, which threw darts as well as stones; the *tricolle*, which hurled quarrels, or square-headed arrows; the *espringal* or *springal*, which threw large darts, &c. The Arbalest, or Crossbow (q.v.) may be regarded as a small portable arrow-throwing ballista.

Ballistic Pendulum. An instrument so named was invented by Benjamin Robins (q.v.), about 1742, to ascertain the speed of projectiles, and to prove the quality of gunpowder. It consists of a large block of wood suspended from a strong horizontal axis; and it is so solidly constructed as to bear a very heavy blow from a shot without injury. An excavated centre on one side of the block is filled with sand, packed in leather upon an iron frame; four bags form a filling or core. The core, forming the place of impact, is easily replaced after each firing. Straps of wrought iron suspend the block from the wrought-iron axis or shaft. The shaft-ends have knife-edges, which rest on V supports. The construction is such that a violent percussion makes only a very slight oscillatory movement in the block. A brass graduated limb measures the arc of vibration; and a brass slide is pushed forward by an index attached to a bar connected with the suspension straps. Another form of instrument for similar purposes is described under *EPROUVETTE*. For *ballistics*, the science of missiles, see *GUNNERY*, and *PROJECTILE*.

Ballium. See *BAILEY*.

Balloon (Fr. *ballon*, 'a large ball'). According to the principle of Archimedes (q.v.), bodies immersed in a fluid are buoyed upwards with a force equivalent to the weight of the fluid displaced by them. If their own weight is not sufficient to counterbalance this force—that is, if they are lighter than the fluid—they rise upwards with a force equal to the difference between the weight of the displaced fluid and their own weight. A balloon, therefore, which consists of an integument enclosing a gas within it, will rise in air in the same way that a cork rises in water, provided that the weight of the whole be less than that of an equal volume of air. If one, for instance, occupy as much space as 1000 lb. of air, but weigh itself—covering, gas, and appendages—600 lb., it will be impelled upwards with a force of 400 lb. The gases employed for filling balloons are either hydrogen or ordinary coal-gas. The former, when

pure, is between fourteen and fifteen times lighter than atmospheric air, and the latter generally about two and a half.

Construction.—A balloon of the common type (fig. 1) is best made of silk, but owing to its cost, either alpaca or cotton is more usually employed. The pieces or gores are sewn together, and the whole varnished to prevent the escape of gas. At the top there is a valve made of wood, from 1 to 3

Fig. 1.—Common form of Balloon.

feet in diameter. This is kept close by a spring, but it can be opened at will by a valve-line which descends through the interior of the balloon by its neck or mouth to the car. M. Giffard's valve, which is liked by some aeronauts, consists of a metallic disc pressed against a wooden hoop by 16 steel springs. A network of cord extends from the circumference of the valve over the surface of the balloon, and supports the hoop from which the car is suspended by six or more strong ropes about 4 or 5 feet long. These ropes require to be carefully adjusted so as not to strain the network. Through inattention to this, a silk balloon tore at Paris, in July 1882, when about 2300 feet above the ground. The furniture of the car is ballast or sand-bags; the barometer, and other scientific instruments; and the grappling-iron, tied to the end of a long rope, for anchoring the balloon at the descent. The aeronaut has, until very recently, had at his disposal the means of guiding his air-ship only in an upward or downward direction, the motion of translation being wholly dependent on the wind by which it is borne. If he wishes to ascend, he throws some of the ballast over the side of the car; and if to descend, he pulls the valve-rope, so that, the gas rushing by virtue of its specific lightness through the passage made for it by the open valve, the buoyant material may be lessened. It is evident that the power of thus directing his machine becomes more limited with each exercise of it, for in each case there is an unrepaired loss of the means necessary. In ordinary flights, the mouth of the balloon is left open, so that there is no danger of explosion arising from the expansion of the gas in the rarer regions of the atmosphere. The diffusion that takes place through the open neck is inconsiderable during the few hours that an aerial voyage lasts. Early aeronauts, who kept their balloons closed, frequently ran considerable risk by inattention to the

valve when the imprisoned gas demanded vent for its expansion. Small pilot balloons are often made of thin india-rubber, and still smaller ones of gold-beaters' skin. Those generally used at illuminations are made of thin oiled or waxed paper. Very small balloons have been sometimes usefully employed in experimenting on the ventilation of large halls to show the directions of currents of air. The balloon is usually spherical in shape, more or less modified, but sometimes it is ellipsoidal, or approaches a lenticular form, and at others it is somewhat like a cigar in shape. Controllable balloons are usually elongated.

History.—The earliest attempts by man to rise in the air were no doubt made by the use of some kind or kinds of artificial wings (see FLIGHT). The art of traversing the air by means of balloons, generally called *Aéronautics*, and sometimes *Aérostation*, is of comparatively recent date. The French missionary Basson, writing in 1694, says that a balloon ascended at the coronation of Fo Kien at Peking in 1306. There is, however, reason to believe that the first balloonist was Padre Guzman, who made an ascent at Lisbon in 1709, using heated air. But the germ of the invention of gas-balloons is to be found in the discovery by Cavendish, in 1766, of the remarkable lightness of hydrogen gas, then called inflammable air. Professor Black, of Edinburgh, seems to have been the first who conceived, in 1767, the idea that a light envelope containing this gas would rise of itself, and is said to have tried the experiment. Cavallo, in 1772, made an unsuccessful attempt to raise swine's bladders and paper-bags with hydrogen, but he succeeded in raising soap-bubbles inflated with the gas. The invention of the balloon is usually ascribed to the two brothers Stephen and Joseph Montgolfier, paper-makers at Annonay, in France, whose names are as distinguished in the development of their own branch of manufacture as in the history of *aéronautics*. It immediately struck these brothers, on reading Cavendish's *Different Kinds of Air*, that by inclosing a light gas within a covering of inconsiderable weight one would be able to navigate the air. Being paper-makers, they naturally fixed upon paper as the most fitting material for the purpose, and first attempted to make balloons of paper filled with hydrogen. Finding that this gas quickly escaped, they sought for another kind, and tried the gas resulting from the combustion of straw and wool, thinking that heat gave it an upward tendency, and that its electrical properties caused it to be repelled from the ground. The failures, of course, arose from the use of a paper envelope. At Avignon, in November 1782, Stephen Montgolfier first succeeded in causing a silk parallelopiped, of about 50 cubic feet, to rise to the roof of a room. Encouraged by this success, the brothers made experiments on a larger scale at Annonay with an equally happy result; and finally, in June 1783, they raised a balloon, 35 feet in diameter, to a height of 1500 feet. This last, nearly spherical in shape, was made of packcloth, covered with paper, and was heated by an iron chafer placed beneath it, in which ten pounds of moist straw and wool were burned.

The news of this extraordinary experiment soon reached Paris, where it produced a most lively impression. Such was the excitement that a sufficient subscription was filled in a few days to repeat the Annonay experiment, and the construction of the balloon was intrusted to the brothers Robert, famous philosophical instrument makers of the day, and to Professor Charles, a young but experienced physicist. Charles fixed upon hydrogen instead of Montgolfier gas for his balloon. By ingenuity and perseverance combined, he triumphed

over the difficulty, then very great, of filling a silk globe, as large as 12 feet in diameter, with this light gas. This balloon was transferred to the *Champs de Mars*, the largest open space in Paris, where, on the 27th of August 1783, it ascended in the presence of 300,000 spectators, half the population of the city. At the instance of the commission already referred to, Stephen Montgolfier constructed a fire-balloon, 72 feet high, and 41 feet in diameter. It ascended before the commission on the 12th of September 1783, but being held captive, it was much injured by a violent wind, which blew at the time, and after it descended it was finally broken up by heavy rains. Joseph Montgolfier sent up a balloon at Versailles seven days later, carrying a cage with a sheep, a cock, and a duck. These were the first aerial travellers.

The balloon was now a *fait accompli*, and it began to be seriously discussed whether it might not be serviceable as an air-ship for bearing men aloft as passengers. The solution of this question was first given by Pilâtre des Rosiers. In a Montgolfière, as the heated-air balloon was called, 74 feet high, and 48 feet in diameter, supporting at its base a gallery of wicker-work, he, in company with the Marquis d'Arlands, made the first aerial voyage in a free balloon, 21st November 1783. They remained in the air twenty-five minutes, and sailed across the Seine and over a considerable part of Paris. The year 1783, so fertile in the annals of aërostation, did not pass away without witnessing a greater triumph. On the 1st of December, Professor Charles, along with Robert, rose from the Tuileries gardens with a hydrogen balloon—then called a *Charlière*—made from the proceeds of a public subscription. This balloon was made of alternately red and yellow gores of silk sewed together, and coated with caoutchouc varnish. It was covered with a net which supported the car, and was furnished with a valve, a barometer, and sand-ballast, and was, in fact, a complete aerial machine, no essential change or improvement on which took place for a hundred years. Before fire-balloons became obsolete, several remarkable voyages were made in them. The same Pilâtre des Rosiers made 30 leagues in one of them, the longest voyage ever executed in a *Montgolfière*. Mr J. Tytler made the first balloon ascent from British soil from the Comely Gardens, Edinburgh, on August 27, 1784. Lunardi made an ascent at London a few days later—viz. on 15th September 1784. J. P. Blanchard, along with the American Dr Jeffries, crossed the English Channel from Dover to Calais in circumstances of almost unparalleled danger, January 7, 1785. Garnerin first descended from a balloon by a Parachute (q.v.), October 22, 1797. The first aëronaut, Pilâtre des Rosiers, fell a victim to a blind devotion to his art. Having constructed a compound machine, consisting of a hydrogen balloon above and a Montgolfière below, and started from Boulogne on the 5th of June 1785, he had not ascended many minutes, when, on attempting to open the valve of the hydrogen balloon, he caused a rent of several yards in it, so that it emptied itself almost immediately, and fell on the Montgolfière beneath. The fire in the latter not being kindled, the whole machine fell with frightful rapidity to the earth, and the ill-fated aëronauts perished on the spot. The introduction of coal-gas, instead of hydrogen, by Mr Green, is the most important advance in aërostation since the earliest days of the art. His large coal-gas balloon, in 1836, bore Messrs Green, Holland, and Mason from London to Weilburg, in Nassau, distant 500 miles, in 18 hours.

Scientific Results.—Balloons have been enlisted on behalf of science. The first ascent for scientific

objects was made at Hamburg, July 18, 1803, by Robertson and Lhoest, and a notable one by Gay-Lussac, who, on 16th September 1804, rose to the height of 23,000 feet. Later scientific ascents were made by Humboldt in America; by Mr Rush and Mr Green in 1847-49; and by M.M. Barral and Bixio at Paris in 1850. The most important ascents for this purpose were those made by Mr Glaisher between 1862 and 1866. He went up 28 times, and 11 of these ascents were made, like those of Mr Rush, on behalf of the British Association. Mr Glaisher found that the rate of decline of temperature with elevation, near the earth, differed much according to whether the sky was clear or cloudy. At the height of 5 miles cirrous clouds were seen apparently yet another 5 miles up, suggesting that their presence at anything like this elevation can hardly be due to moisture at all. The time of vibration of a horizontal magnet was found to be longer high in the air than on the earth. In nearly every ascent, currents of air in different directions were passed through. Sometimes the direction of the wind was the same for only 500 feet above the earth, while at other times it did not change till a height of 20,000 feet was reached. In some of the voyages directly opposite currents were met with at different elevations. As regards physiological observations, Mr Glaisher found that his own pulsations were 76 before starting, and 110 at greater elevations than 20,000 feet. The faces of some persons became glowing purple when up 10,000 feet, while others showed no change. In a balloon the voyager has usually no sensation of motion. Observations made by M. Flammarion in eight or nine ascents from Paris in 1867 and 1868, confirmed for the most part Mr Glaisher's results. Some interesting instantaneous photographs have been taken from balloons in France.

High Ascents.—An ascent of fully 7 miles was made from Wolverhampton, September 5, 1862, by Messrs Glaisher and Coxwell, which is the highest on record. At this great height the cold was intense, the thermometer standing at -12° F. The barometer fell to 7 inches, as compared with 29 at the surface of the earth. When the balloon was 29,000 feet high, Mr Glaisher became insensible, and remained so for seven minutes. Mr Coxwell, at this height, had to mount into the ring to adjust the valve-line, when his hands became frozen, and he had to open the valve by seizing the line with his teeth. He too was very nearly insensible. Up to the height of 5 miles the aëronauts experienced no difficulty in breathing, except when some exertion had to be made. Perfect stillness and silence reigns 6 miles above the earth, but a railway train in motion can be heard at a height of 4 miles. In this ascent the aëronauts passed through a cloud saturated with moisture, about 1100 feet in thickness, entering it one mile above the earth. On another occasion, in the same year, they passed through a similar, or perhaps still denser cloud, during the descent, in which case the balloon so collected weight by the condensation of moist vapour, that notwithstanding all attempts to lighten it, the car on coming to earth received a shock sufficient to break nearly all the instruments.

A remarkable but disastrous ascent was made from the gas-works of La Villette, Paris, on the 15th April 1875. Three aëronauts were in the car of the balloon, which reached the height of 5½ miles. Of the three, Gaston Tissandier alone survived. The two others, Sivel and Crocé-Spinelli, lost their lives when high in the air, either by suffocation from the escape of gas, or from the vertigo of high regions. Tissandier had been unconscious for some time as well as his companions. On the 13th August 1887 another ascent was made from the

same place. This time the *aéronauts* were M. Mallet and Captain Jovis. They did not attain a greater height than $4\frac{1}{2}$ miles, and yet M. Mallet was twice seized with a fainting fit, but his companion felt no inconvenience.

Balloons in War.—In 1794, during the wars of the Revolution, an *aérostatic* institution was formed at Meudon, near Paris, for training a corps of '*aérostatiers*,' in order to observe the enemy by means of balloons. One under the management of this corps was used at the battle of Fleurus, near Charleroi, fought against the Austrians. Reconnaissances were made by use of the balloon in the Italian war of 1859, and in the American civil war. During the siege of Paris, 1870-71, the balloon was extensively employed. Nearly 2,500,000 letters and post-cards, besides several persons (including Gambetta), left the beleaguered city in balloons. There was, of course, no attempt made to come back in such a conveyance; carrier-pigeons were the return messengers. The balloon called the *Ville d'Orleans*, which left Paris on November 21, 1870, descended 15 hours afterwards, near Christiania, in Norway. One supposed to be lost was found long afterwards in Iceland. The balloon was used at Suakin in March 1885, which was the first instance of its being employed by a British force in war. It has been suggested that dynamite might be thrown at an enemy from balloons. In 1887 the British War Department conducted a series of experiments at Chatham on the use of captive balloons for observations; and in July 1886, Mr Eric S. Bruce applied electricity to a captive balloon, so that signals might be flashed in it by an operation on the ground.

Captive Balloons.—A captive balloon is held by a rope to a windlass on the ground. The use of these for military purposes has already been referred to. It is not safe to use them in a stiff breeze. A very large captive balloon was used to make ascents from the Tuileries quadrangle at Paris during the summer of 1878. It was made of strong canvas, and had a capacity of about 25,000 cubic metres. The car held a large number of persons. A steam-engine of 300 horse-power worked the winding apparatus, and the very strong thick rope by which the balloon was moored weighed fully 6000 lb. Mr E. Douglas Archibald's captive kite-balloon, described in vol. xxxvi. of *Nature* (1887), has the kite so attached as to admit of the rope being fastened two-thirds of the way up the side of the balloon, and thus counteracts the depression of the balloon by the wind.

Controllable Balloons.—Although there were one or two earlier experiments tried in the way of steering balloons (e.g. by Giffard in 1852, and Dupuy de Lôme in 1872), M. Gaston Tissandier is the first *aéronaut* who has at least partially solved this difficult problem. His controllable electric balloon was made at Paris in 1893, and is shown in fig. 2. It is of a peculiar elongated form, and is inflated with hydrogen gas. In size it is 91 feet long, and 29 feet in diameter through the middle. The envelope is made of thin cloth coated with an impermeable varnish. There are two horizontal shafts, one on each side, fastened with silk belts along the centre. These are made of walnut laths, and are flexible. Over the balloon a netting of ribbons is placed, and the car is connected with this netting by twenty suspension ropes—five of these being attached to each of its four corners. A kind of rigging connects the suspension ropes about 6 feet above the car. To this rigging the guide and anchor ropes are attached, and the rudder of unvarnished silk is also arranged behind.

The screw-propeller, which is 9 feet 3 inches in diameter, and consists of two blades, is driven by electricity, and the electrical apparatus consists

of a bichromate of potassium battery, and a dynamo-electric motor. The commutator is so arranged that a current of 6, 12, 18, or 24 elements may pass, and thus the screw has four velocities. The car with the motor, batteries, screw, anchor, and other fittings, weighs nearly 1200 lb., the ballast usually taken up weighed 850 lb., and the

Fig. 2.—Tissandier's Controllable Balloon.

balloon itself weighs 600 lb. In one trial, with the screw making 180 revolutions per minute, Tissandier was able to keep head to a wind moving at the rate of 10 feet per second, and when proceeding with the current, to deviate from the line of wind with great ease. At another time, it is said, he was able to attain a speed—no doubt an independent speed—of 9 miles an hour.

Since Tissandier's voyages were made, the French military authorities have commissioned two of their engineer officers, MM. Renard and Krebs, to construct a balloon somewhat resembling Tissandier's, but with some modifications. It is more elongated, and the car is nearly as long as the balloon. With this air-ship, an independent velocity through the air of 13 miles an hour was on one occasion attained. In most of its voyages the balloon has apparently been steered and guided without difficulty, and at all events, in five out of seven ascents made between August 1884 and September 1885, the *aéronauts* were able to return to their points of departure.

Several very experienced *aéronauts*, such as Glaisher, Coxwell, and Nadar, have given their opinion that balloons cannot be steered to any practical extent. On the other hand, some engineers of note take by no means a hopeless view of the question—as Dr W. Pole, F.R.S., and Sir F. Bramwell.

In the United States, *aërostation* has been prosecuted with great zeal. Mr J. Wise has more than once exploded his balloon, when high up in the air, to show what he considers to be always the case, that the fragments with the network form in such circumstances a parachute, which moderates the rapidity of descent. During 1859 a remarkable flight was made by Mr J. Wise, Mr La Mountain, and others, who, starting from St Louis with the intention of reaching New York, travelled 1150 miles in less than 20 hours. M. Nadar made an important ascent in 1863, and M. Godard in 1864. In 1873 a balloon of 400,000 feet of cubic capacity was made to enable Mr Wise to cross the Atlantic; but the balloon burst. The United States signal service has initiated a series of ascents in the interests of meteorology, Mr S. A. King being the *aéronaut* engaged. In 1886 Mr Carl Meyers made at Franklin, Pennsylvania, the first ascent known with natural gas. The balloon rose one mile.

It is worthy of remark that though several melancholy cases of loss of life are on record, the number of casualties in the navigation of the air has been less in proportion than in the navigation of the sea. For 1500 *aéronauts* and 10,000 ascents, calculating approximately, only 15 lives have been lost, certainly a small proportion considering dangers and inexperience.

See Hutton Turner's *Astra Castra: Experiments and Adventures in the Atmosphere* (1865); *Voyages Aériens* (Eng. ed. by T. Glaisher, 1871); *Les Ballons dirigeables*, by Tissandier (1872); *Quart. Rev.*, July 1875; *My Life and Balloon Experiences*, by Coxwell (1888); and the Reports or Proceedings of the Aëronautical Society of Great Britain (founded 1866), the Balloon Society of Great Britain (1880), the French Académie d'Aérostation (1872), and the German Aëronautical Society (1881).

Ballot (from Fr. *ballotte*, 'a little ball') is a little ball used in the practice of secret voting, which is thence generally called 'voting by ballot,' whether it be a ball or a ticket that is used. Votes may be taken by ballot in various ways—e.g. the voter may deposit a ball in either of two boxes, so conjoined that no one shall be able to say into which he drops it; or he may be presented with two balls—a white and a black—and so drop one of them into a box that it shall be unknown which he used. Voting by ballot is now the general method at the elections in countries where constitutional government prevails, and it is usually done by means of papers or cards. Voting by ballot, however, is a very old institution, and was the common form in the historic times both of ancient Greece and Rome. At Athens the voting in the popular assemblies and courts of law was either by show of hands or by ballot. From the use of marked potsherds (Gr. *ostrakon*) in popular voting came the Greek *ostracism*, or secret vote of the people, by which they drove into exile those who became obnoxious to them. *Tabellæ* or tickets were chiefly used by the Romans. If the vote concerned a change in the law, the tickets were marked V. R., the initial letters of the words *Uti Rogas*, expressing consent to the proposer's proposition; and A. for *Antiquo*, 'I am for the old law.' If the vote concerned the election of candidates to a public office, then the tickets bore the names of the candidates. The system of secret voting in Rome was fixed by various laws, the first of which was the *Lex Gabinia*, in 139 B.C.; but the popular assemblies voted by ballot as well as by acclamation long before the passing of these laws.

The system of vote by ballot is much in use among moderns in private or social clubs, and in the election of officers and other acts of public or joint-stock companies. The propriety of employing it in private clubs has never been questioned, for to the harmony of these it is essential that the votes of a few should suffice to exclude an obnoxious person; and in view of the personal and invidious nature of the vote, it is equally essential to their harmony that the voting should be secret. A candidate for admission, who succeeds in the face of a few though not a sufficient number of voters, could not but regard those who voted against him as enemies. But if the voting be by ballot, all he can know, if the voters keep their own counsel, is that some persons were unfriendly. It is thus left open for him to associate on friendly terms with all the members—a condition of the success and continuance of such associations. But whether the system is suited to political and municipal voting has been a question of keen discussion.

We have said that the system prevailed in ancient Greece, and regarding its results—especi-

ally in the exercise of the ostracism—there have been various opinions. While some have considered that the Athenians, for instance, under cover of secrecy often acted without a just sense of responsibility, there is the authority of Mr Grote, in his *History of Greece*, on the other side, to the effect, that they exercised the right most beneficially. But if we have in Mr Grote an advocate of the ballot, in Gibbon we have an opponent of it. In his *Decline and Fall of the Roman Empire*, that historian dates the decline of the republic from the introduction of secret voting, which, he says, destroyed public confidence—in effect, broke up the ancient relations of patron and client, and caused a general demoralisation of the people. To come to modern times, we find the ballot in use in the Venetian senate; and that in Britain it was first demanded, not for the purpose of elections, but of votes in parliament. After the restoration in 1662 it was used for purposes of ostracism in the Scottish parliament. In 1710 a proposal for secret voting was carried in the English House of Commons, but rejected by the Lords. From 1840 to 1845 the ballot was in use in the French Chamber of Deputies. But the idea of secret voting in deliberative and legislative assemblies responsible to the people is now universally abandoned as inconsistent with the fundamental principles of popular government, of which publicity and the free criticism rendered possible by publicity are the great safeguards.

Towards the end of the 18th century vote by ballot for elections to parliament was advocated by some of the Whigs; and it was one of the first things demanded by English reformers at the beginning of the 19th century, the followers of Bentham being specially earnest in advocating it. It stood in the original draft of the Reform Bill of 1832. Grote first proposed it in 1833, and renewed the motion every year till 1839. It was one of the six points of the Chartist. In 1851 the proposal of vote by ballot was carried in the Commons against the opposition of Lord J. Russell and the Liberal government of that time by a majority of 51. The report of a select committee of the House of Commons in 1869 greatly contributed to decide public opinion in favour of the ballot as a necessary safeguard against corruption, intimidation, disorder, and all sorts of undue influence at elections. The result was Mr Forster's Ballot Act of 1872, which introduced secret voting at all parliamentary and municipal elections except parliamentary elections for universities. It had already been adopted for school-board elections in 1870. With the introduction of the ballot at parliamentary elections, the public nomination at the hustings, which had been so often associated with rioting and violence, disappeared.

In the New England colonies the practice of secret voting was in vogue from the very first, and it has now been adopted throughout the United States. It is prevalent also in the self-governing English colonies in Canada and Australia, and in most, if not all the countries of Europe which have adopted parliamentary institutions—in France, Germany, Italy, &c. While it may with substantial justice be maintained that open voting is theoretically the best at elections of every kind, on the ground that the suffrage being a public trust, it should be openly and manfully exercised with the full sense of responsibility, secret voting is now generally regarded as practically the most satisfactory method. Though it is not a perfect safeguard against bribery and intimidation, it has proved to be very effective. Since its adoption, elections have proceeded with greater quietness, order, and with comparatively little corruption.

Ballo'ta. See HOREHOUND.

Balls, HOLLOW. See SHOT.

Ballycastle, a small seaport in the north of County Antrim, Ireland, on an open bay opposite Rathlin Isle, 68 miles N. of Belfast by rail. Its harbour and pier cost £150,000, but the former is now filled with sand, and the sea has destroyed the latter. Coal was dug here at least 500 years ago. *Bally* represents in place names the Irish *baile*, 'town.' Pop. 1446.

Ballymena, a small town of County Antrim, Ireland, on the Braid, 33 miles NNW. of Belfast by rail. It lies in a densely peopled and well-cultivated district, the inhabitants uniting the pursuit of agriculture with the manufacture of linen. Ballymena is one of the greatest linen and flax markets in Ireland, and its vicinity is covered with extensive bleach-fields. Pop. (1881) 8883.

Ballymoney, a market-town of County Antrim, Ireland, 53 miles NNW. of Belfast by rail. It has some trade in linen. Pop. (1881) 3049.

Ballyshannon, a small seaport town of County Donegal, Ireland, the chief town of the county, though not the capital. It is situated at the mouth of the river Erne, on a small inlet running off from Donegal Bay, 157 miles NW. of Dublin by rail. There is a salmon-leap and a valuable salmon-fishery on the river. Pop. (1881) 2840.

Balm (*Melissa officinalis*), a fragrant perennial herb belonging to the order Labiatae, a native of the south of Europe and Western Asia, and naturalised in a few places in England, has long been cultivated in gardens. The stems and leaves are still occasionally used in medicine as a gentle stimulant and tonic, and were formerly in high repute. The taste is somewhat austere, and slightly aromatic. The quantity of essential oil, on which its whole qualities depend, is not more than sufficient to communicate a pleasant flavour to the infusion. — A variety of the common Cat-mint (*Nepeta cataria*), with a smell like that of balm, is often mistaken for it. — Moldavian Balm (*Dracocephalum moldavicum*) is a native of Eastern Europe, Siberia, &c. — Bastard Balm (*Melittis melissophyllum*), a native of the south of England and of many parts of Europe, is a very beautiful plant, which when dried has a delightful fragrance, and retains it long. *Calamintha nepeta* is sometimes called Field-balm, while *Collinsonia* is termed Horse-balm in America. Balm-like properties are extremely common among the Labiatae (q.v.). The name is from the late Latin *balsamum*.

Common Balm
(*Melissa officinalis*).

Balme, Col de, a mountain pass between Mont Blanc and the Dent du Midi, over which goes the route from Martigny to Chamonix. The summit is 7200 feet high.

Balmerino, a small village of Fife, on the Firth of Tay, $3\frac{1}{2}$ miles SW. of Dundee by water. Near it are scanty remains of a Cistercian abbey (1227), whose lands came into the possession of Sir James Elphinstone, created Lord Balmerino in 1604. The sixth and last lord (1688-1746) was beheaded on Tower Hill for his share in the '45. See J. Campbell's *History of Balmerino* (Edin. 1867).

Balm of Gilead. See BALSAM OF GILEAD.

Balmo'ral, a royal residence in Braemar, Aberdeenshire, 9 miles W. of Ballater, and 52 $\frac{1}{2}$ of Aberdeen. Standing 926 feet above sea-level on a natural platform that slopes gently down from the base of Craig-gowan (1437 feet) to the margin of the river Dee, it commands a magnificent prospect on every side. In 1848 Prince Albert purchased the reversion of a 38 years' lease from the representatives of Sir Robert Gordon, who had held it under the Earl of Fife; and in 1852 he acquired the fee-simple of the estate from the Fife trustees for a sum of £32,000. The old castle not being sufficiently commodious for the royal family, Prince Albert erected a new one (1853-55) at a cost of £100,000 in the Scottish Baronial style of architecture. The castle consists of two separate blocks of building, united by wings, with a massive tower 35 feet square, rising to the height of 80 feet, and surmounted by a turret 20 feet higher. At a distance, the castle, which is built of granite, has a strong and imposing appearance, looking almost as if it had been hewn out of one huge rock of that material. The estate now includes Birkhall, Knock Castle ruins, and Loch Muick; and extending to the summit of Byron's 'dark Lochnagar,' it, with its deer-forest, comprises upwards of 25,000 acres.

Balnaves, HENRY, of Halhill, Scottish Reformer, was born at Kirkcaldy in Fife of poor parents, but was educated at St Andrews University and at Cologne. He acted for some time as a procurator at St Andrews; in 1538 James V. made him a Lord of Session; and in 1543 the regent Arran appointed him secretary of state. Shortly after, however, he suffered a six-months' imprisonment in Blackness Castle on account of his Protestantism; and next year, like Knox, he joined Beaton's murderers in the castle of St Andrews. When the castle was captured by the French (1547), Balnaves, with Knox and others, was sent to Rouen as a prisoner of war. While in prison here, he wrote a treatise on Justification, which, with notes and a preface by Knox, was published in 1584 as *The Confession of Faith*. In 1556 Balnaves' forfeiture was rescinded, and he returned to Scotland, and took an active part on the side of the Lords of the Congregation. In 1563 he was nominated a commissioner to revise *The Book of Discipline*. He died in 1579.

Balrampur, a town of Oudh, India, near the frontier of Nepal. Pop. 15,000.

Balsam, a name formerly comprehending medicines compounded of resins and oils, as well as many resinous substances and oils, to which important medicinal virtues were ascribed. When the term balsam is now used without addition, the balsams of Peru and Tolu are generally intended. — These two balsams are very similar in all their more important properties, and are both produced by trees of the genus *Myroxylon*, of the natural order Leguminosae, sub-order Papilionaceae, natives of the tropical parts of America. *M. perara*, the source of balsam of Peru, is a tree found in the state of San Salvador, in the district called Balsam Coast.

M. toluifera, a native of Venezuela, Ecuador, and Brazil, furnishes balsam of Tolu. After being bruised and charred, the bark of the former falls off, and balsam begins to exude. It is received on rags, which, when saturated, are boiled in water, the separated balsam falling to the bottom. It is a liquid, having the appearance of treacle, but rather less viscid. Balsam of Tolu is generally soft and tenacious when first imported, becoming hard by age. Both balsams have a very fragrant odour. They are used in confectionery, to impart a flavour like that of vanilla; also in perfumery, and for pastilles, &c. In medicine, they are administered as gentle stimulants and tonics, and particularly in chronic bronchial affections. *Tolu lozenges* are a popular and pleasant remedy for troublesome coughs. These balsams are also used for cleansing ulcers.—They contain cinnamic acid, and a peculiar oily substance which has been called *cinnamine*, and is also known as Oil of Balsam of Peru. The name *White Balsam of Peru* is sometimes given to a balsamic substance which flows from the *Liquidambar styraciflua*. See LIQUIDAMBAR.

Balsam is also the common name of a genus of succulent herbaceous plants, of which the beautiful balsam (*Impatiens balsamina*), so much cultivated in gardens and greenhouses, is a familiar example.

Balsam (*Impatiens tricornis*).

Upwards of one hundred species are known, natives chiefly of damp bushy places in the East Indies, and many of them plants of great beauty. They are almost all annuals, and have generally white or red flowers. The balsams are usually regarded as a sub-order of Geraniaceæ (see GERANIUM), of which they are simply the most differentiated type, but are distinguished by the extreme irregularity of the flowers, which have been the subject of much controversy among morphologists, and also by the beakless fruit, which is a five-celled capsule, bursting by five elastic valves. The leaves are simple, and without stipules, the flowers generally axillary. The common balsam is a native of the East Indies and Japan. Many fine varieties, double as well as single, and of all varieties of colour and marking, have resulted from careful cultivation, and florists distinguish pyramidal, dwarf, and camellia-flowered races. It has an upright succulent stem, usually about 1-2 feet high, but in favourable circumstances will attain a greater size. In Britain, the seed is usually sown on a slight hotbed, and the plant is often kept in the greenhouse; although even in Scotland it may be made an ornament of a sheltered border. It is one of the flowers frequently to be seen in cottage-windows. A vulnerary was formerly prepared from it, whence it has its name. One species of balsam (*Impatiens noli-me-tangere*), called Yellow Balsam or Touch-me-not, is a native of Europe, and a doubtful native of Britain. It has yellow flowers,

and one of the petals prolonged into a spur. Its ripe capsules burst on the slightest touch, scattering the seed.

Balsam or **Balm of Gilead** is a liquid resinous substance, which has long enjoyed a very high reputation in the East for its fragrance and medicinal virtues. It is the subject of several allusions in the Old Testament, and is celebrated by Strabo, Pliny, Diodorus Siculus, and other ancient writers, almost as a cure for every disease. It is generally believed to be derived from a species of Balsamodendron (q.v.). The finest balsam, called Opobalsam, or Balm of Mecca, is of a golden yellow colour, and of a consistence like honey. Balm of Gilead is irritating when applied to the skin. Other substances sometimes designated balsams, and possessing a somewhat similar fragrance, are produced by different species of Amyridaceæ (q.v.). Among them is one called American Balm of Gilead, the produce of a tree called *Iceia Carana*.—Balsamic substances are furnished also by a number of species of Clusiaceæ—Balsam of Umiri, a fragrant yellow fluid, by *Humirium floribundum*, a South American tree, of the natural order Humiriaceæ.—Canada Balsam (q.v.) is a kind of turpentine obtained from the Balm of Gilead Fir (*Abies balsamea*); Hungarian Balsam, from the Mugho or Mountain Pine (*Pinus pumilio* or *Mughus*); and Carpathian Balsam, from the Stone Pine (*Pinus pinea*). See FIR and PINE.—Balsam of Copaiva (q.v.) is the produce of different species of Copalifera. See EMBALMING.

Balsamodendron (Gr., 'balsam-tree'), a genus of small trees or bushes of the natural order Terebinthaceæ (q.v.). Some of them are spiny; they generally exhibit a scrubby appearance, and have little foliage, but are remarkable for the resins or balsams obtained from their wood and fruit—as Balsam of Gilead, Myrrh, Bellium, and Elemi (q.v.). The known species are mostly natives of the East Indies, Arabia, and the east of Africa.

Balta, a town on the Kodema, an affluent of the Bug, in the government of Podolia, Russian Poland. Tallow-melting, soap-boiling, and brewing are carried on. Pop. (1880) 22,440.

Baltic, BATTLE OF THE. See COPENHAGEN.

Baltic Provinces (in Russia). This term, in a wider sense, comprehends the five Russian governments bordering on the Baltic—viz. Courland, Livonia, Esthonia, Petersburg, and Finland; in a restricted sense it often designates the first three. The Baltic provinces once belonged to Sweden, except Courland, which was a dependency of Poland. They came into the possession of Russia partly in the beginning of the 18th century, through the conquests of Peter the Great, partly under Alexander in 1809. The three Baltic governments strictly so called have an area of 36,500 sq. m., and (1882) a population of 2,196,396. No pains have been spared to Russianise them, and since 1876-77 they have lost their remaining privileges, and been thoroughly incorporated in the Russian empire. They form, however, a borderland between the Germanic and Slavonic areas, and have been a frequent cause of difficulty between Germany and Russia. The bulk of the population (over 1½ millions) is composed of Esths and Letts; the Germans number above 200,000, the Russians only 65,000. See also LITHUANIA.

Baltic Sea is the great gulf or inland sea bordered by Denmark, Germany, Russia, and Sweden, and communicating with the Kattegat and North Sea by the Sound and the Great and Little Belts. Its length is from 850 to 900 miles; breadth, from 100 to 200; and area, including the Gulfs of Bothnia and Finland, 184,496 sq. m., of which

12,753 are occupied by islands. Its mean depth is 44 fathoms, and the greatest ascertained depth, between Gottland and Courland, 140. Its shallowness and narrowness, its numerous islands and reefs, the shoal coasts of Prussia on the one side, and the rocky coasts of Sweden on the other, and above all, the numerous and sudden changes of wind accompanied by violent storms, make the navigation of the Baltic very dangerous. The group of the Aland Islands divides the south part of the sea from the north part or Gulf of Bothnia (q.v.). The Gulf of Finland (q.v.), branching off eastwards into Russia, separates Finland from Esthonia. A third gulf is that of Riga or Livonia. The Kurisch and other Haffs (q.v.) are not gulfs, but fresh-water lakes at the mouths of rivers.

The water of the Baltic is colder and clearer than that of the ocean, and contains only a fourth of the proportion of salt found in the Atlantic. Ice hinders the navigation of the Baltic from three to five months yearly. Rarely, as in 1658 and 1809, the whole surface is frozen over. Tides, as in all inland seas, are little perceptible—at Copenhagen, about a foot; yet the water rises and falls at times, though from other causes, chiefly from the varying quantity of water in the rivers at different seasons. Upwards of 250 rivers flow into this sea, which, through them and its lakes, drains rather less than *one-fifth* of all Europe, its drainage area being estimated by Dr W. B. Carpenter as 717,000 sq. m. The chief of these rivers are the Oder, Vistula, Niemen, Dwina, Narva, Neva; the waters of Lake Maeler, and those of Wetter and other lakes reach the sea through the river Motala. The principal islands are Zealand, Fünen, Bornholm, Samsoë, and Laaland, belonging to Denmark; the Swedish islands Gottland, Oland, and Hveen (in the Sound); the Aland Islands, belonging to Russia; and Rügen, to Prussia. Timber, hides, tallow, and grain are the chief exports from the countries bordering on the Baltic. The number of vessels that pass the Sound to or from the Baltic annually is very large. See SOUND.

The Eider Canal, connecting the Baltic near Kiel with the North Sea at Tonningen, facilitates the grain trade in mild winters; and the two seas are also connected by the Gotha Canal, which joins the lakes of South Sweden. These are navigable for boats of light draught only; but

Map showing the new Baltic and North Sea Canal.

in June 1887, works were inaugurated for a great canal, from Brunshüttel, at the mouth of the Elbe, to Holtenau and Kiel, which will allow the passage of the largest vessels. It will be 61 miles long, 26 feet deep, 65 yards wide at the surface, and

24 at the bottom; and as the voyage round from the Elbe to Kiel represents nearly 600 miles of dangerous sailing or steaming, the possession of such a waterway will be of great value to the German navy. The cost is estimated at about £8,000,000, and the yearly maintenance at £50,000. The most important harbours in the Baltic are: in Denmark, Copenhagen; in Germany, Kiel, Lübeck, Stralsund, Stettin, Danzig, Königsberg, and Memel; in Russia, Riga, Narva, Kronstadt, and Sveaborg; and in Sweden, Stockholm and Karlskrona.—The shores of the Baltic in Prussia and Courland have been long noted for the amber cast ashore by the waves in stormy weather. Another important phenomenon connected with the Baltic is a slow vertical movement of its coasts, *downwards* in the south of Sweden, but farther north *upwards*, being there supposed to be at the rate of 3 feet in a century. Its area is held to be gradually decreasing. The Germanic nations call this sea *Ostsee*, or East Sea; the name Baltic first appears in the 11th century, in a work by Adam of Bremen.

Baltimore, a port of entry and the largest city of Maryland, and the seventh city of the United States in population, stands on the northern bank of the river Patapsco, an arm of Chesapeake Bay, about 250 miles by ship-channel from the ocean, 96 miles SW. of Philadelphia, and 40 NE. of Washington, D.C., in 39° 17' N. lat., 76° 37' W. long. Its site is uneven, and its surroundings are picturesque and pleasant. The plan of the streets is not so strictly uniform as in many American cities. The harbour is spacious and perfectly secure, having a minimum depth of 24 feet, and access from the sea is safe and easy. Baltimore is reached by numerous lines of railway connecting in a Grand Union Depôt, and having several other stations in various parts of the city. It is an important centre of the traffic in bread-stuffs, which are largely received by rail and shipped at this point. Other leading articles of export are tobacco, provisions, coal, cotton, naval stores, canned fruits, and oysters. The imports include large amounts of guano, coffee and other tropical products, fertilisers, iron, steel, tin-plate, and chemicals. Baltimore is also the seat of extensive and varied manufactures, and in 1880 it ranked as the eighth city of the United States in the extent of its manufacturing interests. Its manufactured products include cotton and woollen goods; flour of superior quality, largely produced in Baltimore and vicinity; tobacco and cigars, in the manufacture of which is employed a capital of more than a million dollars; beer; glassware; boots and shoes; iron and steel, including machinery, car-wheels, iron bridges, stoves, furnaces, &c.; clothing, in the manufacture of which nearly \$4,000,000 are invested, producing goods to the value of about \$10,000,000 per annum; pianos, organs, &c. One of the principal industries of Baltimore is the canning of oysters, in which over 6500 hands are employed during the annual oyster season—several thousand vessels being engaged in the oyster fishery, and bringing to this port from 8,000,000 to 12,000,000 bushels of oysters. It is estimated that the various departments of the oyster industry of Baltimore give employment to over 20,000 hands, whose wages aggregate about \$3,500,000 each year.

Baltimore is noted for the fine architecture of its public and other buildings, among the finest being the chamber of commerce, the Roman Catholic cathedral, the custom-house, the Maryland Institute, the academy of music, the city-hall, the Johns Hopkins Hospital, the post-office, and the Peabody Institute (see PEABODY). The public

monuments, of which five or more are noteworthy (the Washington column being 210 feet high), have given Baltimore the name of the 'monumental city.' There are several public squares and parks, the beautiful Druid Hill Park of nearly 700 acres, purchased by the city at a cost of about \$800,000, being the most celebrated. There are some 200 churches, among which the Roman Catholic, the Protestant Episcopal, and the Methodist denominations are conspicuous. The educational institutions are many and important. The Johns Hopkins University, endowed with over \$3,500,000 by a Quaker philanthropist of that name (1795-1873), was opened in 1876, and already takes rank as one of the first seats of learning in the country. Among other institutions are the Baltimore City College, the Baltimore Female College (Methodist), the academy of science, the law school, three or more medical schools, Loyola College, St Mary's University, and a state normal school; and there are complete systems of graded public and parochial schools. The city has a number of good libraries, of which the largest is that of the Peabody Institute (1876).

Baltimore is a place of much wealth and social refinement, and is noted as an art-centre. It is the seat of a Roman Catholic archbishop, who has the rank of primate of the United States, the see being the oldest in the country. The diocese of Baltimore was created in 1789; and the see became archiepiscopal in 1808. Dr John Carroll was the first bishop and archbishop. Owing to the fact that Maryland was originally settled to a great extent by members of the Roman Catholic Church (chiefly of English birth), that church and its adherents have always had a greater social influence in Baltimore than in most American cities of its size. Baltimore is also the seat of a bishop of the Protestant Episcopal Church. The population of the city is of various origin. Less than one-sixth of the people in 1880 were of African descent, and about one-sixth were of foreign birth. Among the native-born population of the city there is a rather large element of German descent, and many Irish and French creole families were among the earlier settlers. In colonial days, the English Puritans, and later, the Scotch-Irish Presbyterians, were here numerous. Of the present inhabitants, a considerable proportion have been born in states lying farther north than Maryland.

Founded in 1729, the city was named in honour of Lord Baltimore, the founder of the Maryland colony, and in 1796 was incorporated as a city. It very early became noted for its commerce and ship-building. It was the scene of important events during the war of 1812-15, and in the early part of the civil war of 1861-65. Pop. (1790) 13,503; (1830) 80,625; (1860) 212,218; (1880) 332,313; (1890) 434,439. Several large and populous suburban towns are not represented in these official census figures.

Baltimore is a small fishing-village in County Cork, on Baltimore Bay, 7 miles SW. of Skibbereen. Here was established in 1887, by the Baroness Burdett-Coutts, a technical school for giving instruction in all that pertains to fishing, sail-making, net-making, &c.

Baltimore, GEORGE CALVERT, first LORD, born at Kipling, in Yorkshire, about 1580, entered parliament in 1609, was knighted in 1617, and in 1619 became Secretary of State. In 1625 he declared himself a Catholic, and resigning his office, received the rank of Baron Baltimore in the Irish peerage. His Irish estates were at the same time confirmed to him, and thither he retired. As early as 1621, Calvert had despatched colonists to a

small settlement in Newfoundland, and in 1627 he visited the place. In the following spring he returned with his family, and stayed till the autumn of 1629. The severe winter induced him to sail southward in search of a more genial country; but his attempts to settle in Virginia led to disputes, and he returned home to obtain a fresh charter. He died, April 15, 1632, before the completion of the patent, which was granted in June to his son, Cecil, second Lord Baltimore. See MARYLAND, and Life by Neill (Balt. 1869).

Baltimore Bird or Oriole (*Icterus Baltimorei*), a finch-like perching bird, very common in North America from Canada to Mexico. The males arrive from the south about the beginning of May, and are soon followed by the females. They settle near houses on tulip-trees, pea-vines, and the like, and build a beautiful hanging nest of skilfully interwoven moss and fibres. The name 'hang-nest' obviously refers to this habit. They levy contributions from any loose soft material that may come handy, such as the hairs of horses and cattle, the thread laid out for bleaching, or the strings wound round the fruit-tree grafts. The

Baltimore Oriole.

pendulous pouch measures 6 or 7 inches in length, and varies somewhat according to the climate. The bird itself is somewhat smaller than a starling, measuring about 7 inches in length, with sharp conical bill longer than the head, long pointed wings, and medium-sized rounded tail. The plumage is very gay, especially in the males, glossy black, finely contrasting with bright orange and vermillion. Orange and black were the colours of Lord Baltimore's livery, hence the name Baltimore Bird. Another of its many aliases, 'fire-bird,' describes its bright flashing appearance among the branches. The song is powerful and pleasing, and is peculiarly mellow during the love-season. These birds are gregarious, and while they do some damage by plundering pea-pods and other fruits, more than compensate for their thefts by their destruction of orchard insects like the cankerworm and tent-caterpillars. They are quick and lively in their habits, and make courageous parents. The genus *Icterus* must be distinguished from the true Orioles (q.v.). See Baird, Brewer, and Ridgway, *North-American Birds*.

Baltistan, or LITTLE TIBET, is an alpine region through which the Upper Indus flows. It lies below the Kara-Korum Mountains and the Himalayas, with a mean elevation of 11,000 feet, and contains the nameless peak marked K¹, 28,278 feet high, next to Everest, the highest on the globe.

It is politically a part of Kashmir, and the inhabitants are of Mongolian stock.

Baltjik', a seaport of Bulgaria, on the shore of the Black Sea, 20 miles NE. of Varna. Near it are the ruins of Tomi, whither Ovid was exiled. Pop. 4000.

Baluchistan. See BELUCHISTAN.

Balzac, HONORÉ DE, was born at Tours on the 20th May 1799. He was educated at the Collège de Vendôme and studied law at the Sorbonne. In opposition to his father's wish that he should become a notary, he left Tours in 1819 to seek his fortune as an author in Paris. From 1819 to 1830 he led a life of frequent privation and incessant industry, producing stories which neither found nor deserved to find readers, and incurring—mainly through unlucky business speculations—a heavy burden of debt, which harassed him to the end of his career. He first tasted success in his thirtieth year on the publication of *Les Derniers Chouans*, which was soon afterwards followed by *La Peau de Chagrin*, a marvellous interweaving of the supernatural into modern life, and the earliest of his great works. After writing several other novels, he formed the design of presenting in the *Comédie Humaine* a complete picture of modern civilisation. All ranks, professions, arts, trades, all phases of manners in town and country, were to be represented in his imaginary system of things. In attempting to carry out this impossible design, he produced what is almost in itself a literature. The stories composing the *Comédie Humaine* are classified as 'Scènes de la Vie Privée, de la Vie Parisienne, de la Vie Politique, de la Vie Militaire,' &c. They are connected by a web of intrigue which has the Paris of the Restoration for its centre, but which stretches its threads over the provinces. Each of the actors in the brilliant crowded drama is minutely described and clothed with individuality, while the scenes in which they move are set forth with a picturesqueness and verisimilitude hardly to be matched in fiction. Among the masterpieces which form part of Balzac's vast scheme may be mentioned *La Recherche de l'Absolu*, *Le Père Goriot*, *Les Illusions Perdues*, *Les Paysans*, *Les Marana*, *La Femme de trente Ans*, *Les Parents Pauvres*, and *Eugénie Grandet*. The *Contes Drôlatiques* (1833) stand by themselves. They are a series of gross stories in the vein of Rabelais, Balzac reproducing with masterly skill the French of the 16th century. Balzac's industry was phenomenal. He represents himself as working regularly for fifteen and even eighteen hours a day. He wrote eighty-five novels in twenty years, and he was not a ready writer, being very fastidious in regard to style, and often expending more labour on his proof-sheets than he had given to his manuscript. His work did not bring him wealth; his yearly income, even when he was at the height of his fame, is said to have rarely exceeded 12,000 francs. During his later years he lived principally in his villa, *Les Jardies*, at Sèvres. In 1849, when his health had broken down, he travelled to Poland to visit Madame Hańska, a rich Polish lady, with whom he had corresponded for more than fifteen years. In 1850 she became his wife, and three months after the marriage, in August of the same year, Balzac died at Paris. His influence on literature has been deep and many-sided, and novelists with so little in common as Feuillet and Zola alike claim him for their master. He studied character and the machinery of society in a scientific spirit, but he was not content with the photographic reproduction of fact. He was a visionary as well as an analyst, an idealist and a realist in one. The materials acquired by study were shaped and coloured by his

fiery and teeming imagination. In the *Comédie Humaine* we see the everyday world reflected in a magic mirror, where the lights are brighter, the shadows darker; where objects stand out in sharper relief, and are sometimes oddly distorted. He strenuously exaggerates in the delineation of character. 'Every one in Balzac,' says Baudelaire, 'down to the very scullions, has genius.' His work bears trace of the strain with which it was produced; it is often coarse, often extravagant, occasionally dull. But few writers give such an impression of intellectual force, and in the power of investing his creations with apparent reality he stands first among novelists. His sister, Laura Surville, whom he loved with a rare affection, and to whom he opened throughout his life all the hopes and sorrows of his heart, wrote his biography (1858). The 'édition définitive' of his works was published in 25 vols. (1869-75); the last contains his correspondence from 1819 to 1850 (Eng. trans., with memoir, 2 vols. 1879). A supplemental volume is the *Histoire des Œuvres de Honoré de Balzac*, by Lovenjoul (1879).

Balzac, JEAN LOUIS GUEZ DE, born at Angoulême in 1594, in his youth was secretary to Cardinal la Valette at Rome. There he cultivated his taste for elegant composition, and on his return to Paris devoted himself to the refinement of his native language. His efforts in this direction have given him a permanent place in the literature of his country; and though his writings do not possess much intrinsic worth, they heralded the splendid phalanx of genius which adorned the subsequent age of Louis XIV. He was a favourite of Cardinal Richelieu, a member of the French Academy, a councillor of state, and historiographer. His violent literary disputes with Father Goula caused him to leave Paris and retire to his hereditary property of Balzac, where he died on the 18th February 1654. His collected works were edited by the Abbé Cassaigne (1665); selections, by Malitourne (1822), and Moreau (1854). Of all his works, his *Lettres* (1806) and *Lettres Inédites* (1874) are most admired.

Bambarra, one of the Soudan states of Western Africa, lying (where 5° W. long. and 12° N. lat. cross one another) on both sides of the Upper Niger. In the east, the country is flat and swampy; but in the west there are low chains of granite hills. The climate in some parts is intensely hot, but is generally healthy. The land is well watered and fertile. The inhabitants, a branch of the Mandingoes (q.v.), number about 2,000,000, and are superior to their neighbours in intelligence. The upper classes profess Mohammedanism, but the lower are pagans. The principal towns are Sego, Sansanding, Yamina, and Bamako. Many local merchants are very wealthy, and a pretty extensive trade is carried on, the natives working articles in gold, ivory, and iron. In 1881 a treaty with the sultan of Sego opened up the country to French traders.

Bamberg, a Bavarian city, in Upper Franconia, beautifully situated on the banks of the Regnitz, 3 miles above its confluence with the Main, and 33 N. of Nuremberg by rail. Set in the midst of vineyards, orchards, and hop-gardens, and founded about 769, from 1007 to 1802 it was the seat of independent prince-bishops. The most noteworthy of its fourteen churches is the cathedral, a magnificent edifice in the Romanesque style, founded by the Emperor Henry II. in 1004, and thoroughly restored in 1828-37. It has five towers, and contains, among other monuments, the elaborately carved tomb of the founder and his empress, Cunigunda. There are several other fine ecclesiastical structures of early

date, and opposite the cathedral is the palace (1702) of the former prince-bishops, from one of whose windows Marshal Berthier (q.v.) met his death. St Michael's Benedictine abbey (1009) was in 1803 converted into an almshouse. The ruins of the castle of Altenburg, originally the seat of the Counts of Babenberg, and the scene of many important historical events, stand on an eminence $1\frac{1}{2}$ miles from the town. The educational institutions of Bamberg are numerous. Pop. (1871) 25,738; (1885) 31,205; chiefly engaged in the manufacture of beer which is famous throughout Germany, cotton, cloth, gloves, tobacco, musical instruments, &c. A large export trade in liquorice and garden-seeds is carried on. Albrecht Pfister, one of the earliest printers, was practising his art at Bamberg in 1461.

Bambino (Ital., 'babe'), a term in art descriptive of the swaddled figure of the infant Saviour. The *Santissimo Bambino*, in the church of the Ara Coeli at Rome, is held in great veneration for its supposed miraculous power of curing the sick. It is carved in wood, painted, and richly decorated with jewels and precious stones.

Bamboo (*Bambusa*), a genus of grasses, of which most of the species attain a great size, many of them 20 or 30 feet, some 70 or 100 feet in height. The species are numerous, and are found in tropical and subtropical regions, both of the eastern and western hemispheres. Some of the species grow to the height of only a few feet; and almost all of them are slender in proportion to their height, although *B. guada* has often a trunk 16 inches in diameter. All of them have a jointed subterranean root-stock (rhizome), which throws

Bambusa falcata :

a, upper portion of the stem, with foliage; b, root-stem; c, section of stem.

up 10-100 stems. These are generally straight and erect; although one large species (*B. agrestis*), common in dry mountainous situations in the south-east of Asia, has crooked, and sometimes

creeping stems. The stems grow to their full height unbranched, but afterwards throw out straight horizontal branches, especially in their upper parts, forming a dense thicket; some of the smaller kinds are often planted as hedges. The stems are jointed like those of other grasses, very hard, but light, elastic, and hollow, containing only a light spongy pith, except at the joints or nodes, where they are divided by strong partitions. The stems of different species vary also very much in the thickness of the woody part, and so in their adaptation to different purposes. In China and Japan is found a bamboo the stem of which, instead of being cylindrical like that of other bamboos and all grasses, is square. At three years old, this stem is one inch in section each way (see *Nature*, vol. xxxii.). The *hairy* bamboo is one of the most useful in China. The external covering of the stem is, in all the species, remarkably siliceous; the stem of *B. tabacaria* is so hard that it strikes fire when the hatchet is applied. There is perhaps scarcely any plant that serves such a variety of domestic and economical purposes. It would be difficult to point out an object in which strength and elasticity are required, and for which lightness is no objection, to which the stems of the different species are not applied. In the whole of the East, particularly in India, China, and Japan, in Jamaica and other parts of the West Indies, and some parts of South America, it forms almost the sole material of which the houses of the poor are built. It is employed for water-pipes, for which purpose its hollow stems (after the partitions at the joints are removed) render it eminently well fitted. It is used in the building of bridges, in the manufacture of furniture, ladders, masts for boats, rails, fences, spear-shafts, domestic utensils, and agricultural implements. The stems are also split up finely and worked into mats, and ropes, and even into the sails of boats. From both the external and internal pellicles of the stems an excellent paper is made by bruising and steeping it in water till it becomes a paste. Large quantities of bamboo cane are imported to Europe for various purposes, such as the making of walking-sticks, stakes for flowers and the training of fruit-trees in nurseries, and the manufacture of wicker-work. The leaves of some kinds are used as thatch in the making of hats and mats; those mats seen enfolding chests of tea being made of the leaves of one species cultivated by the Chinese for that purpose. The shoots, when young and tender, are eaten in the same way as asparagus, or boiled with milk, or made into broth with the addition of animal food, spices, and salt; also along with the young root-stocks they are pickled in vinegar wherever they abound in the East, and are imported into Europe as an eastern condiment under the name *Achiar* or *Achar*. The pith of some species is sugary, and at certain seasons a saccharine juice exudes from it at the joints, which becomes concrete on exposure to sun and air, and is used for domestic and economic purposes in India. This substance is called *Indian Honey*, and is erroneously also sometimes named *Tabaris* or *Tabasheer*, a name which properly belongs to another and very remarkable substance produced in the hollow internodes of the stems of some of the species (see *TABASHEER*). The seeds of some species are used as rice, and for making a kind of beer. Bamboos are generally of very rapid growth, and they are often found in arid situations, which would otherwise be destitute of vegetation. *B. guada* and *B. latifolia*, both natives of South America, have the internodes of the stems filled with clear fluid of an agreeable taste, which, though containing slight traces of sulphates and chlorides, can scarcely be distinguished from pure spring-water. It is not improbable that they may yet be

employed, where they do not naturally abound, to render districts productive which are now little else than deserts, in climates like those of Arabia, the north of Africa, and Australia; and the quality of the grain of different species seems to deserve more attention than it has yet received. The species common in the West Indies (*B. vulgaris*) is supposed to have been introduced from the East Indies. A few species are found in the Himalaya, to an altitude of 12,000 feet, and a dwarf species from that region has been successfully tried in the open air in England. See JUNGLE.

Bamborough Castle, an ancient fortress on the coast of Northumberland, 5 miles E. of Belford, and 16½ SE. of Berwick. It crowns a basaltic rock, 150 feet high, and accessible only on the SE. side. According to the *Saxon Chronicle*, it was founded about 547 by Ida the 'Flame-bearer,' first king of Northumbria, and named *Bebbanburgh*, after Bebbe, his queen. In 642 it was unsuccessfully besieged by Penda, the heathen king of Mercia; and during the Danish descents on England it twice was partly demolished. Robert de Moubray, the rebellious Earl of Northumberland, having fallen into the hands of William Rufus in 1095, his countess surrendered the stronghold under the threat of seeing his eyes seared out. When Northumberland was granted to Henry, son of David I. of Scotland, Bamborough Castle was reserved for the English crown, and here Baliol acknowledged Edward I.'s supremacy in 1296. During the Wars of the Roses, it was the scene of several conflicts, and was so battered and destroyed that it has not again been used as a fortress. In the reign of Elizabeth, its governor was Sir John Forster, and it continued in his family till Tom Forster forfeited it for his share in the '15, as is finely told in Mr Besant's romance. Lord Crewe, Bishop of Durham, then bought it, with the Forster estates, and bequeathed it in 1721 to trustees for benevolent purposes. The restoration of the castle, and its conversion to its present charitable uses, were chiefly carried out by the Rev. Dr John Sharpe, who in 1792 left his library to the institution. Its income, which is about £9000, is expended in providing a cheap market for the poor; a dispensary for the sick; funds for maintaining, educating, and starting in life poor children of the district; appliances for the rescue and relief of shipwrecked sailors; the repair of churches; and aiding young men at the universities. Bamborough village, near the castle, was a royal borough before the Conquest, and in the time of Edward I. returned two members to parliament. Grace Darling (q.v.) is buried in the churchyard. See *Freeman's English Towns and Districts* (1883).

Bambouk, a country of Senegambia, Western Africa, lying in the angle formed by the Senegal and Faleme rivers. The climate is unhealthy, especially during the rainy season; but the valleys are remarkable for their fertility. Trees common to Western Africa here attain enormous proportions. Vast herds of wild oxen roam the hills, and most of the wild animals of Africa abound. Bambouk has rich iron ore and deposits of gold in its rivers, especially the Faleme. Faramaba and Mandinka are the chief towns. The inhabitants, the Mandingoes, are professedly Mohammedans, but they cling to many pagan superstitions, and are very ferocious.

Bamian is a mountain-valley in Afghanistan, on the chief road between Kabul and Turkestan, and near the northern base of the Koh-i-baba range (see map at AFGHANISTAN). The valley itself lies 8500 feet above sea-level. The stream that drains it ultimately finds its way to the Oxus. The inhabitants are Hazaras. The most notable feature of

the district is a number of human figures of enormous size carved in the conglomerate rocks, from 200 to 300 feet high, which form the northern side of the valley. Of these there are five in all; and the

The largest of the Figures at Bamian.

two principal were described by the Chinese Buddhist monk, Hwen Thsang, who visited the valley about 630 A.D. By recent careful measurement, it appears that the largest is 173 feet high, or 3 feet higher than the Nelson Monument in Trafalgar Square; the second is 120 feet; the others are about 50 and 30 feet. The figures are solidly carved in niches in the rock, but the drapery and finishing are in stucco; and they have been much damaged by cannon shot, said to be those of the army of Nadir Shah. The two larger figures are usually regarded as male and female; but it is certain that Hwen Thsang was right in regarding them both as figures of Buddha; in the Chinese traveller's time there was a large Buddhist settlement here, with 10 convents and 1000 monks, and Bamian was a 'royal city.' That the figures are the work of Buddhist artists from India seems almost certain from their style of art, as also from the pictures with which the niches in which they stand have been covered. Stairs cut in the rock enable visitors to climb to the head of the figures. About two miles east of Bamian there seems to have existed a stupendous recumbent figure '1000 feet in length,' representing Buddha entering Nirvana (q.v.); as modern travellers do not mention any traces of it, it was probably composed of rubble plastered over, and so has disappeared.

The rocks are further full of caves, the great majority of which are occupied at the present day. These caves have curious domed roofs, and are covered with pictures in the same style of art as the niches containing the statues. The caves are dug out of the rock at various heights. There is now no town of Bamian, but there are a few small villages scattered up and down the valley. See an article in the *Journal of the Royal Asiatic Society* (1886) by Captain Talbot, with notes and sketches by Captain Maitland. From these sketches our illustration is taken.

Bampton Lectures, a series so called after the name of their founder, the Rev. John Bampton, a minor canon of Salisbury, who at his death in 1751 left £120 per annum to the university of Oxford, for the endowment of eight divinity-lecture sermons, to be preached at Great St Mary's every year, and to be published, at the expense of the

estate, within two months of their delivery. The lectures are directed to be upon the following subjects: 'to confirm and establish the Christian faith, and to confute all heretics and schismatics; upon the divine authority of the holy Scriptures—upon the authority of the writings of the primitive Fathers as to the faith and practice of the primitive Church—upon the divinity of our Lord and Saviour Jesus Christ—upon the divinity of the Holy Ghost—upon the articles of the Christian Faith as comprehended in the Apostles' and Nicene Creeds.' Only men who have taken the degree of M.A., either at Oxford or Cambridge, are qualified for election, and the same person shall never be chosen twice. The first course was delivered in 1790, since when, with the exception of the years 1834, 1835, and 1841, there has been an unbroken series of very valuable, but rather learned than popular discourses. None of these have caused such controversy as the lectures delivered by Dr Hampden (q.v.) in 1832, on 'The Scholastic Philosophy considered in its Relation to Christian Theology,' which were attacked on all sides, their author being accused of Rationalism and Socinianism. Other more eminent lecturers have been Heber (1815), Whately (1822), Milman (1827), and Horne (1828). The course delivered by Dean Mansel (q.v.) in 1858, on 'The Limits of Religious Thought,' also gave rise to an interesting, but less bitter discussion. Since then, Canon Liddon's lectures (1866) on 'Our Lord's Divinity;' those by Dr Hatch on 'Early Christian Organisation' (1880); and those by Dr Higg on the 'Christian Platonists of Alexandria' (1886) have been among the most important.

A course of lectures similar to the Bampton was founded about the same time at Cambridge by the Rev. John Hulse. See HULSEAN LECTURES.

Ban, a Persian title meaning 'lord,' 'master,' or 'keeper,' and brought into Europe by the Avars. Formerly, it was bestowed on some of the military chiefs who guarded the eastern boundaries of the Hungarian kingdom, and was therefore synonymous with the German *Markgraf*. The ban, who was appointed by the sovereign, but not for life, and whose appointment had to be ratified by the national diet, had originally very extensive powers. In political, judicial, and military affairs, he was the supreme authority within his *Banat*. The most important banats were those of Dalmatia, Croatia, Slavonia, Bosnia, Machow, and Szörény, afterwards formed into the double banat of Dalmatia and Croatia. In 1849, Croatia, Slavonia, and Dalmatia were transformed into Austrian crownlands, and the ban made wholly independent of Hungary; but in 1868 Croatia and Slavonia were reunited with Hungary. One of the Hungarian ministers superintends the affairs of the 'Kingdoms of Croatia and Slavonia;' while there is a special local administration for internal affairs. The head of this administration is called the Ban.

Ban, a word occurring in most of the modern languages of Europe, and primarily signifying 'to proclaim' or 'publish.' This meaning it retains in *Banns* (q.v.) of marriage. In French military language, *ban* is the part of the population first liable to be called out in case of war; the *arrière-ban* is the reserve. In Germany, the *acht* or *ban-num* was a sentence of outlawry pronounced in the middle ages against those who escaped from justice, or refused to submit to trial. We often read of refractory princes, and even cities, being placed under the *ban of the empire*. When a grant of land was made for a religious purpose, or when a charter of liberties was granted, the transaction was proclaimed in public with certain ceremonies, and curses were denounced against any one who should violate the deed. Thus *banning*, or publishing,

came to be associated with cursing; and hence the origin of the popular use of the word. It occurs in this sense in Shakespeare and Milton, and other old writers.

Banana, the fruit of *Musa sapientium*, a herbaceous plant of arboreal proportions and palm-like aspect, belonging to the natural order Musaceæ. It is believed to have been originally

Musa paradisiaca :
a, fruit.

of the East Indies, but is now found, along with the plantain, distributed and cultivated by man throughout the tropical and subtropical regions of the globe. The banana and the plantain were formerly regarded as distinct species, the latter being named *M. paradisiaca*, but there is no real specific distinction between the two forms. The varieties are very numerous, and run into each other by almost imperceptible gradations, while on the same bunch have been found growing fruits as diverse in form and other qualities as the distinct types commonly known as banana and plantain. To the large-fruited group is often ascribed the more farinaceous quality usually associated with the plantain, and to the small-fruited group the highly saccharine character of the banana.

This distinction can hardly be maintained as constant. Though really herbs, the bananas assume all the appearance of trees. Their stems, formed merely of the sheathing bases of the stalks of the large palm-like leaves, are soft, spongy, and destitute of woody structure, yet attain, according to the different species, the height of from 5 to 25 feet. In the tropics the stems are annual—that is, they die after perfecting the fruit, and fresh stems are developed from buds in the root-stock, which is perennial. These stems, or rather buds, furnish the common means of propagating and making fresh plantations, and the growth is so rapid that the fruit is usually ripe within ten months of the time of planting the offsets. When full grown, the stem is surmounted by a crown of large leaves, 6 to 10 feet long by 2 to 3 feet broad, the blade resembling the blade of an oar, with a strong fleshy foot-stalk and mid-rib. The flowers spring in great spikes from the centre of the crown of leaves, and are arranged in whorl-like clusters along the spike; the female flowers occupying the base of the spike, and the male the apex. The fruits are variously formed, some being angular, others cylindrical or even spherical, and vary in length from 4 to 12

inches, and in diameter from 1 to 1½ inches. The average weight of a bunch is about 25 lb., but individual bunches often exceed 40 lb.

It is one of the principal sources of food in tropical countries, taking the place of the cereals of more temperate climates. Its productive powers are prodigious; per imperial acre, it was estimated by Humboldt to produce 44 times more by weight than the potato, and 133 times more than wheat. It is stated that the fresh core of the fruit yields about 40 per cent. of dry meal. The more mealy kinds are never eaten raw except when ripe, but in all its unripe stages it is boiled and eaten as a vegetable. It is roasted also and flavoured with the juice of orange or lemon and sugar, and made into compôtes; dried in ovens or in the sun, with the addition of spices and sugar, it is formed into a paste that will keep in a perfect condition for years. In South America, besides forming an indispensable article of diet in its fresh state, it is also an important article of internal trade in the shape of flour. The sugary or luscious kinds are used also in a variety of ways, and preserved by drying. By fermentation it yields a wholesome wine.

The banana is in many other ways useful to man. The stem yields a juice that is employed as an astringent, and its spongy pith, when pounded and boiled, forms a tolerably nutritious food of a starchy character. In Tonquin the stems are burned, and the ash used in purifying sugar. All parts of the plant abound in fibre which is believed to be well adapted to the manufacture of cordage and paper, but has never been systematically utilised, except in the most limited manner. The inhabitants of Dacca make from it the string of the bow with which they tease cotton, and in some of the islands of the Indian Ocean cloth is made from it. The top of the stem is boiled and eaten as a vegetable, and the leaves are used in packing, and for many domestic purposes.

There are many other species of *Musa*, the most notable of those besides the banana having edible fruit being *M. Cavendishii*, a very dwarf form, largely cultivated in China; the fruit having similar qualities to the typical form of plantain—i.e. farinaceous rather than saccharine. It is not uncommon in hothouses in this country, being easily cultivated. *M. textilis* (Abaca, q.v.) is the plant that yields the valuable fibre known under the name of Manila Hemp, a product of the Philippine and neighbouring islands. The finer qualities of this fibre are worked into delicate fabrics, so extremely fine that many yards may be inclosed in the hollow of the hand. *M. troglodytarum*, remarkable for bearing its clusters of fruit erect (not pendent as in the other edible species), furnishes food to the natives of the Moluccas, where the plant grows wild. *M. Ensete*, a native of Abyssinia, does not yield edible fruit, but the stem, before it becomes hard and fibrous, is an excellent esculent. Bruce says: 'When soft, like a turnip well boiled, if eaten with milk or butter, it is the best of all food, wholesome, nourishing, and easily digested.'

Banas, or BUNAS, the name of three rivers of India.—(1) A river of Rajputana, rising in the Aravalli Mountains, flows N.E. through Mewar for 120 miles, then S.E., and falls into the Chambal, after a total course of 300 miles.—(2) A river which also rises in the Aravalli Mountains, and after a south-westward course of 180 miles, is lost in the Runn of Cutch.—(3) A river of Chutia Nagpur, Bengal, has a north-westward course of about 70 miles, and falls into the Son, near Rampur.

Banat, any district or territory under a Ban (q.v.), but specially applied since 1718 to a part of

Hungary which has no separate *ban* or governor. Bounded W. by the Theiss, S. by the Danube, and N. by the Maros, it consists of the three counties of Temesvár, Torontál, and Krassova. Pop. (1890) 1,308,341. It is partly mountainous and partly flat, is swampy and unhealthy in the west; but is eminently fertile and productive, yielding rich crops of wheat and other grain. The mines are valuable. The principal town is Temesvár. It was formed into an Austrian crown-land in 1849, but was incorporated with Hungary in 1860.

Banbridge, a town in County Down, Ireland, on a steep slope on the left bank of the Bann, 76 miles N. of Dublin. It is a thriving seat of the linen manufacture in all its stages, from the preparation of the soil for the flax-seed to the finishing of the finest linen. Miles of bleaching-greens exist in the vicinity, and numerous factories along the Bann. Pop. (1841) 3324; (1881) 5609.

Banbury, a small town of Oxfordshire, on the Oxford Canal and the Cherwell, 23 miles N. of Oxford, and 78 NW. of London by rail. Its strong castle, built about 1125, was demolished during the Great Rebellion, when Banbury was noted for Puritanical zeal. In 1469 the Yorkists were defeated in the vicinity. The town is still famous for its cakes and ale, as in Ben Jonson's day; and it manufactures webbing and agricultural implements. Among the buildings are the parish church (1797) and the town-hall (1854). Till 1885 Banbury returned a member to parliament. Pop. (1871) 4122; (1881) 3600.

Banc, legally, is a seat or bench of justice, and in this sense has given rise to the expression of the English courts of common law 'sitting in banc,' or *in banco*—that is, sitting together on the bench of their respective courts. Since the Judicature Act, 1873, two or more judges sitting together are called a Divisional Court.

Banca, an island from 8 to 20 miles broad lying S.E. of Sumatra, from which it is separated by the Strait of Banca. Together with a few contiguous islands it forms the Dutch Residency of Banca, with an area of 4977 sq. m., and a pop. (1883) of 70,877, of whom as many as 20,495 were Chinese. The surface is for the most part level or undulating, but the island is by no means fertile, the banana and the durian being its only fruits. Gold, iron ore, silver, lead, and amber are found, but tin is the chief mineral. The annual output is valued at over £350,000, and most of it finds a market in China and Japan. The once dense forests have been terribly thinned for smelting purposes. The principal imports are rice, salt, and European goods. The capital, Muntok, in the north-west part of the island, has a fort and 3000 inhabitants.

Banco (It.), a commercial term meaning the standard money in which a bank keeps its accounts, as distinguished from the current money of the place. The distinction was more necessary when the currency was depreciated, or when it consisted, as it often did, of clipped, worn, and foreign coins. These the early banks (Venice, Amsterdam, &c.) received at their intrinsic worth, and credited the depositor in their books with this bank-value. The term was chiefly applied to the money in which the Hamburg bank kept its accounts, before the adoption of the new universal coinage of the German empire. It was not represented by any coinage. See also **BANC**.

Bancroft, GEORGE, principally distinguished as the author of the history of his country, but not without note as a diplomatist and statesman, was born in Worcester, Massachusetts, October 3, 1800. At the age of thirteen he entered Harvard

Copyright 1898 in U.S.
by J. B. Lippincott
Company.

College, graduated with high honours in 1817, and spent two years in study at Göttingen, Germany, where in 1820 he received the degree of Doctor of Philosophy. Returning to America in 1822, he served a year as Greek tutor in Harvard College when he and Dr Cogswell, a fellow-tutor, established the Round Hill School at Northampton, Massachusetts, with which Bancroft was associated until 1830. In 1823 he published a volume of poems, and subsequently made translations from the German of the minor poems of Goethe, Schiller, &c., and of some of the historico-political works of Heeren. In 1834 appeared the first volume of his *History of the United States from the Discovery of the Continent*; followed by the second and third volumes in 1837 and 1840 respectively—the whole embracing *The History of the Colonisation of the United States*. These were succeeded in the interval from 1852 to 1860 by five volumes narrating the history of the colonial period to the Declaration of Independence, and in 1866 and 1874 respectively by the two concluding volumes, bringing the history to the treaty of peace with the mother-country in 1782. Bancroft subsequently published *The History of the Formation of the Constitution of the United States* (2 vols. 1882), which afterwards formed a constituent part of the revised edition of the complete *History of the United States*, embraced in six volumes (1882-84). In his political sentiments, Bancroft in early life was a democrat. He served as collector of the port of Boston (1838-41), under President Van Buren, and was an unsuccessful candidate for the governorship of Massachusetts in 1844. He accepted a seat in the cabinet of President Polk as secretary of the Navy in 1845, and the following year was appointed minister to the court of St James, a position which he filled until 1849, with honour to his country. A period of retirement from public life followed his return to America. In the civil war he was heartily in accord with the national government, and in 1867 he was appointed by President Johnson minister to Berlin, serving with distinguished ability until recalled at his own request in 1874. He afterwards resided in Washington, contributing occasional articles to magazines. He died 17th January 1891.

Bancroft, HUBERT, an industrious North American historian, born in the state of Ohio in 1832, settled at San Francisco in 1852, where he started a bookshop, and soon amassed a large fortune. He formed at a vast expense a library of 40,000 volumes, mainly on old American history and ethnography. A part of the books collected for the library of the Emperor Maximilian of Mexico came into his possession. The result of his profound studies is his well-known work, *The Native Races of the Pacific States* (5 vols. New York, 1875-76), forming the first portion of his colossal undertaking, a *History of the Pacific States of North America*, to be completed in 39 vols. Of this, vol. i. appeared in 1882.

Bancroft, RICHARD, Archbishop of Canterbury, and a bitter opponent of the Puritans, was born at Farnworth, Lancashire, in 1544. Sent to Cambridge by his uncle, Hugh Curwen, Archbishop of Dublin, he took his B.A. in 1567, and in 1576 became rector of Teversham, Cambridgeshire. Other preferments followed in rapid succession, until in 1597 he was consecrated Bishop of London. He attended Elizabeth during her last illness; and at the famous Hampton Court Conference under James I., he was one of the chief-commissioners on behalf of the Church of England, and took the lead in the disputations. He succeeded Whitgift as Archbishop of Canterbury in 1604, and died November 2, 1610. Bancroft had a high character as a preacher and statesman, and

was a vigilant ruler of the church. He is author of two treatises and two sermons, one of which, preached at St Paul's in 1588, contains a furious invective against the Puritans.

Band, in Architecture, is the name given to any flat fascia or ornament which is continued horizontally along a wall, or by which a building is encircled. Bands often consist of foliage, quatrefoils, or of simple bricks. *Band of a shaft* is the moulding or suits of mouldings by which the pillars and shafts are encircled in Gothic architecture. Several bands are often placed at equal distances on the body of the shaft, when it is long, in which case they are known as shaft-rings.

Band of a Shaft.

Band, or BANDS, linen pendants from the neck, forming part of clerical, legal, and academic costume. It is a moot question whether they are a survival of the Amice (q.v.), or immediate descendants of the wide falling collar which was a part of the ordinary civilian dress in the reign of James I. In the Anglican Church they now are seldom worn, except by ultra-Low Churchmen; but they are in common use with Presbyterian ministers (ordained ministers as distinguished from licentiates). Foreign Catholic ecclesiastics wear black bands with a narrow white border.

Band. Military Bands differ from full orchestral bands in being wholly composed of wind-instruments and drums. The musical instruments allowed by government to regiments in the service are confined to trumpets and bugles for the cavalry and artillery, and fifes, bugles, bagpipes, and drums for the infantry and Highland regiments. The usual number attached to infantry regiments is 16 drummers and fifers (or buglers). The 16 are supposed to be able to play either instrument, and are commanded by a sergeant-drummer (formerly called drum-major). The Highland regiments have each, in addition, 5 pipers and a sergeant-piper (formerly pipe-major), who form a special pipe band. Cavalry regiments have 8 trumpeters and a sergeant-trumpeter (formerly trumpet-major). These several performers, who are paid 1d. per day more than private soldiers, are allowed for the strictly military purpose of signalling commands, &c., in circumstances in which the human voice would be useless. In addition to these there are generally a number of 'acting' pipers, trumpeters, &c., who do not get the extra 1d.

To meet the instrumental and other expenses of a full musical band, the officers above subaltern rank, in addition to a fixed sum on appointment and promotion, each contribute twelve days' pay per annum to a band fund. Government allows the services of 20 men, 1 corporal, 1 sergeant, and a bandmaster, over and above the drummers, &c. already described. Boys are also allowed to the extent of 1 per cent. of the men in the regiment. This brings the number up to about 30. To make the usual number of between 40 and 50 performers, extra men are drawn from the ranks; these are, however, liable to take rank duty on a full inspection parade of the regiment or in active service. In ordinary infantry regiments the pipers and drummers are not usually in the band, as their duties employ them otherwise. In the rifles, however, the buglers, who are more numerous than in other regiments, and in cavalry regiments the trumpeters, all belong to the band, except in such rifle regiments as have their buglers

organised into a separate bugle band. The number of men allowed for the band in cavalry regiments is 15, 1 corporal, 1 sergeant, besides boys, in addition to the trumpeters. Government also contributes £80 per annum to the band fund of each regiment. Cavalry regiments usually possess a double band (composed of the same performers)—namely, a *brass* band for mounted duty, consisting generally of valved brass instruments, treble, tenor, and bass, which can be played with one hand, leaving the other free for the management of the horse; and a *reed* band for dismounted duty or 'programme performance,' in which clarionets, flutes, bassoons, &c. are included. In marching regiments, where the performers have the use of both hands for their instruments, the selection is wider, and the following may be given as a type of a regimental band: 1 piccolo, 1 oboe, 2 E♭ clarionets, 12 B♭ clarionets, 2 bass clarionets, 2 bassoons, 4 horns, 2 baritone, 2 euphoniums, 4 basses, 4 cornets, 2 trumpets, 3 trombones, 2 drums. A great many regiments also have a few performers able to play stringed instruments, usually violoncello and double bass, to assist in the performance of classical music; some regiments even possessing a full string band. Previous to 1857, the bandmasters in the army were almost always private individuals, mostly foreigners, engaged by the officers to instruct the band, and young players were taught by them and the band-sergeant. In that year, however, government instituted a school of military music at Kneller Hall, Twickenham. At first it occupied the same anomalous position as the bands themselves, being partly supported by government and partly by a contribution of £10 per annum from each regiment; but in 1867 the War Office took it over as a government school, and now pays the entire expenses. It has a director of music and nine professors. The primary object of this school is to train promising men, usually band-sergeants recommended by their commanding-officer, for the position of bandmasters. They spend about two years in the institution, and are fully instructed in 'counterpoint' in four parts, and in a knowledge of the compass, capabilities, and proper combination of the various military musical instruments. The army is now altogether supplied with bandmasters from this college; about twenty per annum leaving to join different regiments. They belong to the service, are warrant-officers (a rank specially introduced into the army for their benefit), and are paid by government 5s. per day and rations, in addition to £70 per annum from the officers' band fund, with an allowance for house-rent when living out of barracks; the government strictly adhering to the anomaly of the position by thus paying only half the bandmaster's salary. Kneller Hall also trains such young instrumentalists for regimental bands as are recommended by bandmasters from among the most promising of their boys. These band boys either are sons of soldiers in the regiment, or come from the Duke of York's School, the Hibernian School, Dublin, the bands of industrial schools, or any source whence boys with a knowledge of music can be got. When a boy is recommended to Kneller Hall, he is kept for eighteen months or two years, thoroughly instructed in the use of his instrument, and returned to his regiment; and if he has talent and behaves himself, he has a good chance of eventually rising to the position of bandmaster. When a regiment goes from home on active service, if the absence promises to be short, as in the case of the Ashantee war, the band is left at home till its return; if the regiment is going on long service, the members of the band go with it and assist in ambulance duty, as for instance during the Indian Mutiny.

The sergeant-drummer in infantry regiments and

the sergeant-trumpeter in cavalry regiments is the *military* commander of the band, the bandmaster having authority only over the music, and the men as musicians. The various Guards' bands in London, the bands of the Royal Engineers, the Royal Artillery, and the Royal Marines at Chatham, Portsmouth, and Plymouth, are allowed more men than the line regiments. The Guards' bands have also the privilege individually of accepting private engagements, when these do not interfere with their duty, in plain clothes, in addition to the ordinary engagements as bands by 'permission of the commanding-officer.' The emoluments thus open to the men, induce a better class of musicians to remain in the service than would be the case were they restricted to their pay as soldiers. The bandsmen of line regiments have less opportunity of private engagements, and can only go in plain clothes by special permission. They have, however, their chance of band engagements, the receipts being divided among the band.

The duty of regimental bands is to play at regimental parades, at 'marches out,' to the officers at mess, and when required by the officers. Formerly the music required by the band had to be arranged and 'scored' by the bandmaster, but there are now many journals published (the earliest Boosey's *Military Journal*, 1846) with arrangements of all kinds of music for military bands, thus relieving the bandmaster from much of his hardest work. These journals are of great service to both military and amateur bands, bringing within the reach of every one the finest music, arranged by the very best musicians of the day.

Naval Bands.—Flag-ships only are supposed to carry bands, but other large ships (commanded by officers not less in rank than a post-captain) usually also do so, at the option of the officers. They have generally from 10 to 15 performers, and are mostly supplied from the boy bands of training-ships, supplemented by retired army bandsmen who may join the ships for the purpose. As in the army, the officers provide a band fund, to which government contributes a maximum sum of £20 per annum, and from which the bandmaster's and bandmen's pay are supplemented and the other expenses met.

Volunteer and Amateur Bands.—The great development of the volunteer movement has led to a corresponding development in amateur bands, nearly every volunteer regiment possessing one. Their organisation is, as closely as the circumstances permit, identical with that of the regular army bands, and need not be further described. Other amateur bands are now common throughout the country, nearly every small town having its 'instrumental band.' Some of the amateur bands of Yorkshire and Lancashire, consisting mostly of working-men engaged in mills, iron-works, or collieries, are really good, executing all kinds of music in an astonishingly creditable manner, considering their opportunities for practice. Many districts have their annual brass band contests at which considerable sums of money are given as prizes. For other bands, see ORCHESTRA.

Banda, chief town of a district in the North-west Provinces, India, 95 miles SW. of Allahabad, on the right bank of the Ken River. The town, which is straggling and ill-built, but with clean, wide streets, has 66 mosques and 161 Hindu temples. Pop. (1881) 28,974. It is a great mart for cotton.—The district of Banda contains 3061 sq. m.; its chief product being cotton. Pop. (1881) 698,608.

Bandages are used by surgeons to keep a part of the body at rest, to apply pressure, or to retain dressings or apparatus in position. There are two

chief varieties—the roller, and the triangular handkerchief bandage. The former is that most used for applying pressure and retaining dressings: the latter for fixing splints and as slings, and as an immediate surgical appliance in cases of accident or emergency.

Fig. 1.—Roller Bandage.

The Roller Bandage is a strip of calico, flannel, or elastic webbing, six yards long; its breadth should be one-fifth of the average circumference of the part to which it is applied. In applying it to a limb, it must commence at the extremity, and pass upwards without interruption towards the trunk. It must cover the whole surface, and exert gentle and equable pressure throughout, especially in regions likely to be dependent, since swelling and discomfort occur at points where the bandage is absent or too slack; too tight bandaging, on the other hand, may hinder the circulation and lead to mortification of the part. Both edges of the bandage must be equally tight, or it will not lie smoothly on the limb, but will gape and tend to slip off. No two skin surfaces (e.g. two fingers) must be bound in contact, since the accumulation and decomposition

of cutaneous secretions between them will give rise to irritation. This can be avoided by interposing a layer of absorbent, antiseptic material, such as boracic lint. When a harsh and inelastic bandage is used, it must not be applied directly to the surface, but over closely fitting woollen hose, arm-gloves, &c., which mitigate its pressure and protect the skin. A soft bandage may be applied directly; elastic webbing must only be applied over thick dressings or layers of cotton-wool that distribute and equalise the strong pressure it exerts. A bandage will slip unless both its ends are secured. In commencing to bandage any part of a limb, fix the roller by passing it round alternately above and below the prominence of the nearest available joint; then cover the part to be bandaged by encircling it with coils of bandage applied consecutively from below upwards, each loop covering the upper two-thirds of that previously applied. In parts where the limb thickens rapidly from below upwards, the bandage must be frequently 'reversed' to make it lie smoothly. Holding steady the loops already applied, the bandage is folded sharply upon itself from above downwards, so that the external surface of the loop next applied is the same that was next the skin in the previous loop. This corrects the tendency to leave portions of skin uncovered in conical parts of a limb. The bandage is fastened by a safety-pin, which should traverse several layers of the roller and any texture introduced between the bandage and the skin. The toes and finger-tips should be left uncovered; if they look dusky or become cold, it shows that the bandage is too tight, and must be at once loosened or removed.

Fig. 2.

The Handkerchief Bandage (fig. 2) is a triangular piece of cotton cloth, made by cutting a square yard of the material diagonally from corner to corner. It may also be constructed from an ordinary pocket-handkerchief, by dividing it in the same way, and combining the two small triangles thus produced into one larger triangle by tacking together two of their shorter sides (see fig. 2, B). When thus constructed, the bandage consists of a peak (fig. 2, A, P'), two sides (S'S'), two tails (T'T'), and a base (B'). This appliance may be used for a great number of purposes in addition to those for which the roller bandage is applied. If it be desired to fix dressings in position, and to cover a large area of the body surface, it is used unfolded. If it be required to apply pressure firmly

and locally, or to fix dressings, splints, or other applications on movable parts, it is folded into a broader or narrower cravat form, as shown in fig. 2, C, and is thus applied to the part in question. In folding the bandage, the peak is turned over, so as to touch the middle part of the base (C, 1), and the handkerchief is then folded upon itself longitudinally to one-half or one-third of its present breadth, according to the larger or smaller circumference of the limb it is intended to encircle, and the size of the area it is desired to cover. For most purposes the narrower form (C, 2) will be found most convenient, since it adapts itself more easily to the inequalities of the part to which it is applied. In its unfolded form the handkerchief is used as a covering for the head

(fig. 2, *a*), and as a support to dressings applied to the shoulder (*b*), chest (*c*), stump (*e*), hand (*f*), foot (*g*), and hip (*h*). In this form also it is used as the ordinary sling for injuries of the upper extremity (*i*), where the weight of the arm is supported by the patient's neck and shoulders, and the injured parts are thus saved from strain and kept at rest. If this be supplemented by a second handkerchief bandage, folded narrow, which encircles the chest and the injured arm above the elbow (*j*), the whole upper extremity is not only supported but kept firmly immovable; which adds greatly to the comfort and safety of a patient immediately after an accident, during his transference to a hospital or to his home. In its folded form it makes an admirable temporary support to injured joints, such as the wrist (*k*), ankle (*l*), elbow (*m*), and knee (*n*), and in wounds of the eye (*o*), scalp (*p*), arm (*q*), thigh (*r*), &c., while the careful application of such a bandage satisfactorily supports the jaw (*s*) in cases of severe bruising or fracture. One of its most important uses in the narrow cravat form is to fix improvised splints *in situ* in cases of fracture of the extremities (*t*, *u*, *v*, and *w*). In this form it is also used as a wrist or hand sling (*x*), where the wrist-joint only is injured, and alone needs to be supported, or where a wound of the hand necessitates that member's complete rest. In cases of severe bleeding from wounds of the extremities, it should be used as a *tourniquet* (q.v.). If the bleeding be of a *spitting* character, it implies that an artery of considerable size is divided. In this case the bandage must be made to encircle the limb higher up than the seat of the wound, and must be tightened by twisting (*y*) until the limb is completely constricted and the bleeding temporarily arrested, while immediate surgical assistance is sought for. If the bleeding be of an *oozing* character, the bandage is not applied higher up the limb than the wound, but over the wound itself. A stone or other hard substance is firmly wrapped in a piece of cotton cloth or lint and thrust into the wound, and the cravat-handkerchief applied around the limb at the part sufficiently tight to hold this extemporised plug in position (*z*). Here, the object is not to control the circulation of the whole limb, but to prevent the escape of blood from the wound. This can be greatly assisted by attending to the position of the wounded limb in relation to the law of gravitation. In such circumstances it is usually sufficient, after applying the plug and bandage, to support the upper extremity in a sling, and to prop up the lower extremity on a high pillow. Should this, however, prove ineffectual, it is well to try firm flexion of the joints above the wound, which usually stops the bleeding. If this too fail, the whole limb must be constricted by the twisted handkerchief as above described; which, however, one would gladly avoid if possible, since it is a source of great suffering to the patient. In securing the ends of the bandage, they should either be tied together with a 'reef' knot (*), which will hold firmly, in contradistinction to the 'granny' knot (+), which tends to slip; or if the knot from its position cause discomfort to the patient, it should be dispensed with, and the two ends of the handkerchief sewn together with strong thread or sewing worsted. The figure represents the handkerchief bandage supplied by the St Andrew's Ambulance Association to its members for use as a 'first aid' to the injured in cases of accident and emergency.

Banda Isles, a portion of the Moluccas, consisting of 12 islands, 6 of which are uninhabited, about 50 miles to the south of Ceram. Their mean lat. and long. respectively are 4° 30' S., and 129° 50' E. Area, 17 sq. m.; pop. estimated at 500

Europeans and half-castes, and 6000 natives, mostly descendants of the emancipated slaves. The chief production is the nutmeg, the average annual export of which spice amounts to 1,460,000 lb., with a corresponding quantity—over 280,000 lb.—of mace. An active volcano, Gunong-Api (1744 feet), rises near the centre of the group. In 1801-14 the islands were acquired by the Dutch.

Bandajan, a pass over a range of the Himalayas, in Kashmir. It is amidst mountains of gneiss, and is covered with perpetual snow. The summit of the pass is 14,854 feet above the sea, and is in 31° 22' N. lat., 78° 4' E. long.

Bandana, a kind of printed handkerchief of Indian origin, now extensively made in Britain, usually of cotton. The cloth is first dyed Turkey red, and then the pattern is made by discharging the colour with bleaching liquor in a powerful Bramah press. The pattern to be discharged is cut out on two plates of such metal (lead) as may not be acted on by the liquor, and of the full size of the handkerchief. A dozen or more are put in at once between the plates, and so many of these courses are entered together as fill the press, when the pressure is applied, and the liquor is run in on the uppermost plate, which is grooved on the upper side to receive it, and holed to pass it from plate to plate through all the cloth-folds in the press. The pressure on the cloth, to make clean work by preventing the spreading of the liquor, is enormous. The patterns in the real bandana style of printing are spots and diamond prints, the best suited for discharging, and even for these a pressure of 500 tons is required to work them clean. See CALICO-PRINTING.

Banda Oriental, a state of South America, originally settled by Spaniards from Buenos Ayres, claimed by Brazil, but, after a war, made in 1825 into the independent state of Banda Oriental del Uruguay—i.e. 'Eastern Bank of the Uruguay,' now usually called simply Uruguay (q.v.).

Bandel, ERNST VON, sculptor, was born in 1800 at Ansbach, studied art at Munich, Nuremberg, and Rome, and from 1834 lived chiefly at Hanover, engaged, off and on, for forty years on his great monument of Arminius, near Detmold, 90 feet high, which was unveiled by the Emperor Wilhelm on 16th August 1875. He died near Donauwörth, September 25, 1876.

Band-de-la-Roche, or STEINTHAL, a valley of Lower Alsace, in the Vosges Mountains, noted as the scene of the labours of Oberlin (q.v.).

Bandelkhand. See BUNDELKHAND.

Bandello, MATTEO, an Italian writer of *novelle* or tales, was born about 1480 at Castelnovo in Piedmont. In early life he became a Dominican monk at Milan, but soon abandoned this vocation. After the battle of Pavia (1525) he was driven from Milan by the Spaniards, and settling in France, was in 1550 made Bishop of Agen. He died in 1562. Bandello's tales, 214 in number (4 vols. 1554-73; best ed. Milan, 1814), rank next to those of Boccaccio in Italy, and furnished themes to Shakespeare, Massinger, and other dramatists. They are distinguished by unaffected simplicity of style, fluency and vividness of narrative, and a harmonious brevity of periods. Often, however, they are very impure.

Band-fish (*Cepola*), a genus in the family Cepolidae in the blenny-form division of Acanthopterygious Fishes (q.v.). The body is much elongated and laterally compressed, and is covered by very small scales. The dorsal fin is very long, and consists like the anal of soft rays. The tail vertebrae are very numerous, and the whole structure of the body exhibits unusual delicacy,

so that specimens are seldom obtained in an uninjured state. All the species inhabit quiet depths, and are unable to contend with waves and currents. The snakelike form and the beauty of their colours make them objects of great interest. One species, the Red Band-fish (*C. rubescens*), not uncommon in the Mediterranean, is occasionally cast ashore by storms on the British coasts. It is about 15 inches long. Its brilliant appearance, when seen moving in the water, has suggested the names of Fire-flame and Red Ribbon, by which it is known at Nice. The home of the genus is in Japanese waters.

Bandicoot (*Perameles*), a genus of small marsupials, occupying in the fauna of Australia a place somewhat analogous to that of the much higher shrews in Europe. Like the 'native rabbit' (*Macrotis lagotis*) and the peculiar form known as *Cheropus*, the bandicoots stand midway between carnivorous marsupials like the Tasmanian Devil, and the vegetarian Kangaroos, resembling the former in their dentition, the latter in the structure of the hind-feet. They have altogether 48 teeth, suited to their mixed diet of insects, worms, and roots, and have 10 upper incisors to 6 lower. In the fore-feet the three middle toes are long and clawed, the two outer rudimentary and clawless. The hind-feet are long and narrow, with only the fourth toe well developed.

Bandicoot (*Perameles nasuta*).

The fur is short and rough. The long head forms a pointed snout, the tail is rather short, the marsupial pouch is complete and opens backwards. They keep to the ground, making nests in the hollows. Their movements and habits are like those of hares or rabbits. The largest form (*P. nasuta*) measures about a foot and a half from tip of snout to origin of tail. Numerous species occur in Australia and New Guinea. Their ravages on farm-produce make them of some practical importance. See MARSUPIALS, and Gould's *Mammals of Australia*.

Bandicoot Rat, MALABAR RAT, or PIG-RAT (*Mus giganteus*), the largest known species of rat. The name is a corruption of the Telinga *pandikoku*, literally signifying pig-rat. The animal inhabits many parts of India, and is plentiful in Ceylon. It is chiefly found in dry situations, and often in hilly districts. It attains the weight of two or three pounds, and is 24 to 30 inches long, including the tail, which at the base is 2½ inches in circumference. The body is thick, and greatly arched, black above, grayish below. Its flesh is a favourite article of food with the coolies of India, and is said to be delicate, and much to resemble young pork. It feeds chiefly on grain and roots, and is very destructive in gardens. Its nests, when rifled, are frequently found to contain considerable quantities of rice, stored up against the dry season.

Bandiera, ATTILIO and EMILIO, two brothers of a Venetian family, lieutenants in the Austrian navy, who attempted a rising in favour of Italian

independence in 1843. The attempt was a failure, and they fled to Corfu; but, misled by false information, they ventured to land in Calabria with twenty companions, believing that their appearance would be the signal for a general insurrection. One of their accomplices had betrayed them, and the party was captured at once by the Neapolitan police. Attilio and Emilio were shot along with seven of their comrades in the public square of Cosenza on the 25th July 1844. Both were men of lofty spirit, and their enthusiastic patriotism breathes in every line of their letters to Mazzini, who was then in London. The fact that these letters were opened by authority of the British government aroused much interest in England in the fate of the brothers.

Bandinelli, BACCIO, the son of a famous goldsmith of Florence, and one of the best sculptors of his time, was born at Florence in 1493. He was an angry and jealous rival of Michael Angelo, whose grandeur of conception he strove to equal, and who is said to have retaliated his enmity by contempt. His genius, however, secured him many admirers and patrons among persons of distinction, and Pope Clement VII. even bestowed on him an estate. Among his best works, which all exhibit power, vigour, and skilful drawing, are his colossal group of Hercules with Cacus at his feet, his Adam and Eve, his copy of the Laocoön, and the exquisite *bassi-relievi* which adorn the choir of the Duomo in Florence, where he died in 1560. A very full account of his life is given by Vasari.

Bandit. See BRIGAND.

Band of Hope, the name first given about 1847 to societies of young people, pledged to abstain from all intoxicating liquors. The movement has spread, and now nearly every town and village of the United Kingdom contributes its quota of adherents. The United Kingdom Band of Hope Union (1855) had in 1887 affiliated with it 13,232 societies of juvenile abstainers, having 1,623,033 members. See TEMPERANCE.

Ban'doline is a mucilaginous substance used for stiffening hair, and keeping it in shape or form. It is usually prepared from gum tragacanth, two ounces of which, when digested with a quart of rose-water for two days at a gentle heat, yield a translucent jelly, which is further perfumed by the addition of otto of roses, or oil of bitter almonds. It is also prepared by boiling Carrageen (q.v.) or Irish-moss with water, or by soaking quince-seeds in cold water for a day or two.

Bandon, or BANDONBRIDGE, a town of County Cork, Ireland, on the Bandon, 20 miles SW. of Cork by rail. Bandon was founded in 1608 as a Protestant colony by the first Earl of Cork, was incorporated by James I., and now belongs chiefly to the Duke of Devonshire. Brewing, distilling, and tanning are the chief industries. The pop., which was 6131 in 1871, had diminished to 3997 in 1881. Up till 1885 Bandon returned one member to the House of Commons.—The river Bandon rises in the Carberry Mountains, and at its mouth forms the harbour of Kinsale. Spenser describes it as 'the pleasant Bandon, crowned by many a wood.' It has a course of 40 miles, for 15 of which it is navigable to Innishannon, 4 miles below Bandon.

Bandong, or BANDUNG, a flourishing commercial town in the centre of the western end of Java, in the vicinity of the volcano Gunong Guntour. Since 1864 it has been the capital of a province known as the Preanger Regencies.

Bandy Legs. See LEG.

Baneberry, or HERB CHRISTOPHER (*Actæa spicata*), is a native of the north of Europe, occurring rarely in the north of England. It is a

perennial herb, with leaves ternately compound, deeply serrate, the flowers in racemes, the berries black and poisonous. The root has been used in medicine, but is of dubious reputation; those of two North American species were in high esteem among the Indians, especially as remedies for snake-bites.

Banff (pron. *Bamf*), a seaport and parliamentary burgh, the capital of Banffshire, on the Moray Firth, at the mouth of the Deveron, 50 miles NNW. of Aberdeen by rail; its former Low Town and Sea Town now form a continuous whole. On the right bank of the Deveron, 1½ mile ENE., is the fishing-town of Macduff, included since 1832 in the parliamentary burgh. Scarce a fragment remains of the old castle, in which Archbishop Sharp was born; the present castle is a plain 18th-century edifice. Duff House, the seat of the Earl of Fife, was built in 1745 by the elder Adam. It has a noble collection of pictures, a fine library, and an armoury with the sword of the Gipsy freebooter, M'Pherson, who was hanged at Banff in 1701. The Prince of Wales stayed here in November 1833. The public buildings include a town-house (1796), the county buildings (1871), a lunatic asylum (1865), Chalmers' hospital (1862), and a museum, of which Thomas Edward (1814-86), the 'Scotch naturalist,' was long curator. The harbour of Banff is inferior to that of Macduff, which was greatly improved in 1877. The chief exports are corn, cattle, salmon, and herrings, and coal is the principal import. With Elgin, Cullen, Inverury, Kintore, and Peterhead, Banff sends one member to parliament. Pop. (1851) 6042; (1891) 7578, of whom 3707 were in Macduff. See Imlach's *History of Banff* (1868).

Banffshire, a county in the NE. of Scotland, bounded N. by the Moray Firth; E. and S. by Aberdeenshire; W. by Elgin and Inverness shires. It stands fifteenth among the Scotch counties, both in size and in population. Its greatest length is 59 miles, its greatest breadth is 31, and its area is 646 sq. m. The surface, especially in the south and south-east, is mountainous, interspersed with fertile valleys and fine pastures; but near the coast it is comparatively level. The chief mountain-ranges, rivers, and strike of the stratified rocks, run from south-west to north-east, and the whole county is an extensive slope in the same direction, from the Grampians to the Moray Firth, into which the rivers flow. The coast is rocky, but not high, except to the east of Banff. Chief summits are the Bin of Cullen (1050 feet), Knock Hill (1409), Meikle Conval (1867), Ben Rinnes (2755), and, on the Aberdeenshire border, Ben Macdhui (4296). The chief rivers are the Spey, which bounds a third of the county on the west; and the Deveron, 61 miles long, and mostly included within the county. The predominant rocks are granite, quartz rock, mica-slate, clay-slate, syenitic greenstone, gray-wacke, graywacke-slate, old red sandstone with fossil fishes, metamorphic limestone and serpentine. The serpentine near Portsoy has long been famous as the 'Portsoy marble.' Lead, iron, antimony, and plumbago occur in small quantity. The soil in many parts is very fertile, and highly cultivated. About 38 per cent. of the entire area is in cultivation, more attention being paid to the breeding of cattle than to crops. The manufactures are unimportant, Glenlivet whisky excepted. The herring-fishery is largely carried on; and the salmon-fisheries of the Spey and Deveron are very valuable, the Spey ranking after the Tweed and Tay as a salmon-river. The southern part of Banffshire is in the Highlands, the north being purely Lowland in aspect as in race-characters. Banffshire is divided into the districts of Enzie, Boyne, Strathisla, Strathdeveron, Balveny, Glenlivet, and Strath-

avon. The chief towns and villages are Banff, Macduff, Portsoy, Keith, Cullen, Buckie, Dufftown, and Tomintoul. Banffshire, along with the counties of Aberdeen and Elgin, enjoys the Dick Bequest (q.v.) for parochial education. The county returns one member to parliament. Banffshire contains numerous remains of antiquity, as the old churches of Gamrie and Mortlach, and the ruined castles of Auchindoun, Balvenie, Boharm, and Findlater. The battle of Glenlivet (q.v.) was fought in 1594. Pop. (1801) 37,216; (1841) 49,670; (1881) 62,736; (1891) 64,167.

Bangalore, a fortified town of Mysore, in a district of the same name, 216 miles W. of Madras by rail. When Mysore was occupied by Britain in 1831, Bangalore was made the administrative capital of the state; and when in 1881 Mysore was restored to the rule of its maharajah, the British cantonment of Bangalore was specially exempted from native jurisdiction. Silk and carpets are the principal manufactures; and there is a brisk trade. Lying 3000 feet above sea-level, in the middle of the Mysore tableland, Bangalore has a healthy climate, the thermometer rising only twice above 90° in six years. It was a favourite residence of Hyder Ali; and in 1791 it was stormed by the British under Lord Cornwallis. Pop. (1871) 142,513; (1881) 155,857, of whom 29,521 were Mohammedans, and 17,430 Christians. — The Mysore district of Bangalore has an area of 2901 sq. m., and a pop. of (1881) 669,139.

Bangkok, the capital city of Siam, situated on both banks of the Menam, about 20 miles from its mouth, in 13° 38' N. lat., and 100° 34' E. long. The population is about 300,000, half of whom are Chinese, in whose hands is centred nearly all the trade of Bangkok, which is large, as is shown by the commercial returns. The exports of Bangkok (almost those of all Siam) had in 1885 a value of \$9,400,000; and the imports, \$6,800,000. In 1884 they were rather larger. For their right to trade here, the Chinese pay a poll-tax of about \$3 on entering the kingdom, and a similar sum is collected from them every three years. The payment of this tax exempts them from the half-yearly military servitude which all other oriental strangers resident in Siam are required to give. The approach to Bangkok by the Menam, which can be navigated by ships of 350 tons burden, is exceedingly beautiful. As the town is neared, numerous temples present themselves, and floating-houses become common; and finally, the whole city, with its rich gardens, and shining temples and palaces, bursts full upon the view. A large number of the houses float on rafts, in rows three and four deep. To build on the shore is now a royal privilege, shared only with a few important noblemen. The land-houses are raised upon piles, 6 or 8 feet from the ground, and are reached by rude ladders. The floating-houses are made of bamboo boards, wicker-work, or palm-leaves, and have generally a veranda in front, with a small wing at each end. The circumference of the walls of Bangkok, which are 15 to 30 feet high and 12 broad, is about 6 miles. The internal traffic of Bangkok is chiefly carried on by means of canals, there being only a few passable streets in the whole city. Horses and carriages are rarely seen except in the neighbourhood of the palaces. The chief interest of the kingdom of Siam, according to Sir John Bowring, concentrates itself in Bangkok. Bangkok is the constant residence of the king. The palace is surrounded by high walls, and is nearly a mile in circumference. It includes temples, public offices, accommodation for some thousands of soldiers, with their necessary equipments, a theatre, and rooms for about 3000 females, 600 of whom are the wives of the king.

The famous white elephant has also a place within the palace. Throughout the interior are distributed the most costly articles in gold, silver, and precious stones. The temples of Bangkok are innumerable, and decorated in the most gorgeous style, the Siamese taking a pride in lavishing their wealth on them. Some of them, according to the Catholic bishop Pallegoix, have cost more than 4,000,000 francs (£160,000). The priests who swarm in the city are alone estimated at 20,000. In the neighbourhood of Bangkok are iron-mines and forests of teak-wood. The chief exports are rice, sugar, pepper, cardamoms, sesame, hides, fine woods, ivory, feathers, and edible birds'-nests. The imports are tea, manufactured silks and piece-goods, opium, hardware, machinery, and glass wares. In 1835, 407 vessels of 208,092 tons cleared the port, of which 195, with a tonnage of 134,398, were British. Among recent evidences of progress may be mentioned the erection of steam-mills, the introduction of gas into the royal palaces and many noblemen's houses, and the establishment of a regular mail to Bangkok in 1884, which has been followed by Siam joining the International Postal Union, July 1, 1885. Bangkok is now also connected with Burma and Cambodia by telegraph, and is the centre of a local system of some extent.

Bangor, an episcopal city, borough, and seaport of Carnarvonshire, North Wales, on the SE. shore of the Menai Strait, 60 miles W. of Chester. The grandeur and beauty of the surrounding scenery has long made it a favourite resort, and the opening of the Chester and Holyhead Railway (1850), on the great line of communication from London to Dublin, greatly promoted its prosperity. The town has of late years been greatly improved, and mostly rebuilt. Its chief trade is derived from the great Penrhyn slate-quarries, 5 miles distant, which employ 2000 men. The slates are exported to all parts of the world, and also manufactured at Bangor into tables, chimney-pieces, &c. Pop. (1891) 9892. Bangor unites with Carnarvon, &c. in sending one member to parliament. It is a place of great antiquity. In 525 St Deiniol founded a college here; and in 550 he became the first bishop; the cathedral founded by him was thrice destroyed, in 1071, in 1282, and in 1402. The present cruciform edifice, built between 1496 and 1532, was 'unequaled in meanness' amongst the cathedrals of the United Kingdom, until in 1869 Sir Gilbert Scott began to restore it, and it was reopened in 1880. From a Late Perpendicular structure it has since been transformed to much what it was at the beginning of the 14th century—a dignified cruciform pile, with a low western tower and a new (unfinished) central spire. In 1883 Bangor received a municipal charter, and the University College of North Wales was opened here in 1884.

Bangor, a small seaport and watering-place in County Down, on the south side of the entrance to Belfast Lough, 12 miles ENE. of Belfast by rail. Pop. (1881) 3006. St Cungall in 555 founded Bangor Abbey, which in the 9th century had 3000 inmates, and which forms the subject of an interesting monograph by the Rev. Charles Scott (2d ed. Belfast, 1887).

Bangor, a city and port in the state of Maine, 246 miles NE. of Boston by rail, on the Penobscot, about 60 miles from its mouth, and at its confluence with the Kenduskeag, which affords extensive water-power. At spring-tides, which here rise 17 feet, the harbour is accessible from the sea for the largest vessels, and as the navigation cannot go higher, Bangor is one of the largest lumber depôts in the world, absorbing and monopolising the trade of the heavily timbered basins of the

Penobscot and its tributaries. About 200,000,000 feet of lumber are annually shipped from Bangor during the season of eight months. Bangor possesses a custom-house of granite, several churches, a theological seminary, foundries, planing and sawing mills, furniture factories, &c. Bangor has also some shipbuilding, and foreign and coasting trade. Under English rule the place was known as Kenduskeag; its present name was taken from the well-known psalm-tune, a favourite of one of its ministers, Seth Noble. It was incorporated as a city in 1834. Pop. (1870) 18,289; (1880) 16,856; (1890) 19,103.

Bangorian Controversy. Dr Benjamin Hoadly, Bishop of Bangor, in a sermon preached before George I. in 1717 advanced opinions on the power of the church, by denying the authority of the church over the conscience. He thus drew on himself the fiercest opposition from the advocates of ecclesiastical authority, and provoked a long and keen controversy. In one month as many as seventy-four pamphlets were published on the subject. See HOADLY.

Bangor-Iscoed ('Bangor below the Wood'), a Welsh village, beautifully situated, in a fertile and richly wooded country, on the right bank of the Dee, in a detached portion of Flintshire, adjoining the counties of Chester and Salop, 5 miles SE. of Wrexham. Pop. of township, about 550. It was once the seat of one of the largest monasteries in Britain, founded before 180 A.D., and containing 2400 monks in the time of St Augustine. To distinguish it from Bangor in Carnarvonshire it is sometimes called *Bangor in Maelor*.

Bangsings (*Tupaia*), a family of arboreal insectivorous mammals, sometimes known as squirrel or tree shrews. There are two genera—*Tupaia*, with numerous species, of which the larger are 8 or 9 inches long; and *Ptilocercus*, with a single species, the Bornean pintail. They are all oriental animals, and range from the Khasia Hills in India, to Java and Borneo. The fur is soft and glistening, and a long bushy tail is generally present. They are restlessly active during the day, searching for insects and fruits. Two of the largest species are the Tana (*T. tana*), with a feathery tail, in one variety of a bright golden colour; and the Ferruginous Bangsring (*T. ferruginea*), widely distributed in the Malayan region. The soles of the feet in the latter are plaited like those of geckos, and give the animals a sure grip of a branch. See INSECTIVORA.

Bangweo (also called Bemba), a great Central African lake, discovered by Livingstone in 1868, which is 150 miles long by 75 in width, and 3700 feet above the sea. The Chambese, which flows into it, and the Luapula which issues from it, constitute the head-stream of the Congo. The shores are flat, and parts of the lake are mere marsh. In the NW. part are four large islands, inhabited by the Mboghwa, a race of fishermen and herdsmen. On its south shore Livingstone died.

Banialuka, a town of Bosnia, picturesquely situated on the Verbas, in a fine forest district, 54 miles SE. of Novi by rail. It is strongly fortified, and, besides some Roman remains, contains warm baths, forty-four mosques, important powder-mills, and about 10,000 inhabitants, of whom some two-thirds are Mussulmans.

Ban'ian (from the Sansk. *vani*, 'a merchant'), a member of a Hindu merchant-caste, most numerous in Bengal and the North-west Provinces of India. The name was originally applied more particularly to those from the province of Guzerat,

many of whom had settled early in Arabian ports for purposes of trade; but was frequently extended by early writers to all Hindus in Western India. This class, which in 1881 numbered as many as 3,275,921 souls, carries on a very extensive trade, by means of caravans, with the interior of Asia, even to the borders of Russia and China. Contrary to the general custom of the Indian people, these merchants travel much, and the establishments and counting-houses of Indian Banians are to be found in almost every commercial town of any note in Asia, whilst in Africa they have recently become identified with the slave-trade. Generally speaking, those with sufficient capital subsist solely by money-lending, charging usurious rates of interest; the poorer classes open retail shops, or hawk their goods about the country villages. The members of the caste are mutually helpful, even advancing money to one another at reasonable interest.

Ban'ian Days, a sailor's phrase, meaning days when no meat is served out, so called from the abstinence from flesh of the Banian (q.v.) traders.

Ban'ian-tree. See BANYAN.

Banim, JOHN, Irish novelist, born at Kilkenny in 1798, in 1813 went up to Dublin to study art, and two years later became a drawing-master in his native town. His youth was darkened by an unhappy love-affair; but having achieved some success as a playwright (1821), having married, and settled in London, he produced, in conjunction with his brother Michael, the *Tales of the O'Hara Family* (6 vols. 1825-26), which were followed by *The Croppy*, *The Denounced*, *The Smuggler*, *The Mayor of Windgap*, *Father Connell*, &c. In 1836 general sympathy having been attracted towards Banim's privations, occasioned by disease that precluded all literary exertion, a pension of £150 was awarded him, which was afterwards further increased by £40 for the education of his daughter, an only child. He died in poverty, 13th August 1842, at Windgap Cottage, near Kilkenny. His brother Michael was born in 1798, and died 30th August 1874. Banim failed in his attempt to portray the manners and frivolities of the higher classes; but none of his predecessors—Miss Edgeworth, Lady Morgan, or Crofton Croker—succeeded in depicting so vividly and truly the Irish peasant, with his picturesque peculiarities in his sufferings and errors. Although generally happy in the plot and development of his story, he is too much disposed to dwell on the horrible. His denunciations may be well founded, but they mar the poetic effect. Banim was also not quite free from a somewhat tiresome minuteness of description, and his imitation of Scott is frequently very palpable. See P. J. Murray's *Life of John Banim* (1857).

Banishment (the act of putting under *ban*, 'proclamation,' as an outlaw) is a technical term in Scots Criminal Law for the punishment of sending out of the country under penalties against return. This punishment was formerly much used in various forms—e.g. banishment to the plantations or colonies; to England (even after the Union); from a particular county in Scotland, &c. Sometimes capital punishment was commuted to banishment for service in a foreign war. The old Scots doom of deportation was gradually merged in transportation under various British statutes. At present banishment is still the statutory sentence in cases of celebrating clandestine marriages. The idea of banishment occurs in the ostracism and petalism of Greece, and the relegation, exile, and deportation of Rome. It was generally accompanied by forfeiture of civil rights. In England voluntary banishment was called Abjuration. See OSTRACISM, OUTLAWRY, PRISONS.

Banjermassin', a former sultanate on the SE. of Borneo, with an area of 5923 sq. m., and a pop. of about 300,000, chiefly Mohammedans. Tributary to Holland since 1787, it was annexed on the death of the last sultan in 1857, and is now governed by the Dutch resident for the south and east of Borneo, who has an assistant at Martapura, where the sultans formerly lived. Banjer-massin is watered by large rivers and intersected by a chain of mountains, in several parts rising to 3000 feet. Excellent small-arms are manufactured. The products are pepper, wax, edible nests, rattans, benzoin, dragons' blood, coal, iron, diamonds, and gold dust.

BANJERMASIN, the capital of the residency, is built on the island of Tatas, about 15 miles from the mouth of the Banjar or Barito; pop. 30,000. The town is subject to frequent inundations, and the houses are raised on piles, most of the traffic being carried on in boats. The trade, which is considerable, is mostly in the hands of the Chinese, and the imports include piece-goods, gunpowder, opium, rice, sugar, salt, Chinese porcelain, silks, and a few horses from Java.

Banjo (originally a mere negro mispronunciation of *bandore*, derived through the medium of Spanish or Portuguese, from Lat. *pandura*, Gr. *pandoura*, a three-stringed musical instrument), an instrument of the guitar kind, played with the fingers, but without frets to guide the stopping. It has a long neck; a body like a drum, of parchment stretched on a hoop, and without a back; and from five to nine catgut strings. It has become known principally through its use by the coloured minstrels of the United States, a company of whom came to England in 1846; and it is at present on the increase in popularity. See NEGROES.

Bank Holidays, appointed by Sir John Lubbock's Act of 1871, fall in England and Ireland on Easter Monday, Whit-Monday, the first Monday in August, and 26th December; in Scotland, on Christmas and New-year's Days, Good Friday, and the first Mondays of May and August.

Banking. The term bank (Fr. *banque*; Ital. *banco*, 'a bench,' 'a tradesman's stall,' 'a bank') denotes a building in which the species of financial business now to be described is carried on, and is also applied to corporate bodies conducting that business. A banker is, primarily, a person engaged in that business on his own account and responsibility. In the case of joint-stock companies, the expression is applied to the principal officers in charge of the business. Banking denotes the business itself, which is not specifically either a profession or a trade.

The earliest known bank was the firm of Egibi & Son, who seem, from clay tablets recently discovered near Babylon, to have conducted an important advance, exchange, and general financial business in that city from about 700 to 600 B.C., and subsequently; but it does not appear to have been definitely ascertained how far the character of their business approximated to that of modern banks. The Chinese understood the use of paper-money centuries before the European nations, and are said to have indulged in the practice to excess, and to have established a bank of issue about 1000 A.D. Banking in ancient Greece developed so far as to include deposits at interest and letters of credit, as well as advances. The Romans derived their knowledge of banking from the Greeks. But banking, as now understood, did not commence before the 12th century, when the Bank of Venice was established. Sir John Lubbock thinks that the first real bank was that of Barcelona, founded 1401; and that 'the Bank of Stockholm (1668)

was the first bank in Europe to issue bank-notes. Other early banks were the Bank of St George at Genoa (1407), and the Bank of Hamburg (1619). The Bank of Amsterdam (1609) was the great warehouse for bullion during the 17th century, taking charge of coin and bullion lodged, for which receipts, transferable from hand to hand, were granted; expenses being met by direct charges and a deduction from the nominal value of the sum credited in the books. But money lying in such banks was unproductive and costly to customers. With the advancement of social economy, improved means of communication, and increased mutual confidence, banks of this class are no longer needed, and have passed away. The era of real modern banking commences with the 18th century.

Banks used to be classed as *deposit, discount, and circulation*, those just referred to being of the first class originally, and gradually developing the other departments. A more convenient division for the present time is into *public, joint-stock, and private*, all three conducting every description of banking business, except that many of the two last named do not issue notes. Public banks are established by states to fulfil the functions of centres of credit and holders of the ultimate reserve of legal tender (coin). The medieval public banks were managed by the city corporations, and had no specific capitals; but those of the present time are incorporated companies without such close connection with the governments of their respective countries. Joint-stock banks are incorporated banking companies without such connection or responsibility; and private banks are unincorporated partnerships.

A banker lends money at interest, usually for short periods, on satisfactory security, and receives money on deposit, for which he sometimes allows interest and sometimes does not. A banker does not hoard all the money deposited with him; he gives the greater portion out on loan. The advantages accruing to society from the operations of banking are thus immensely increased. A banker receives from all around him sums of money, both small and great, which would otherwise be useless in the coffers of the owners, and lends it to those who can employ it to advantage and could not otherwise obtain it. Capital hitherto lying useless and unproductive becomes through his agency useful and productive. The direct advantages arising from such transactions are considerable. The banker, if the money is allowed to lie with him for some time, will pay the depositor interest upon it, will lend the amount to a borrower who will engage in some business transaction with it and make a profit thereby; and the banker himself will make a profit in the difference between the interest allowed to the depositor and that charged to the borrower. But besides the direct advantages, the indirect advantages are not less important. With the money thus lent out, manufacturers can purchase raw material to be worked up, and procure food and clothing for their workmen; and traders can go into the markets and purchase commodities for resale. Commodities are thus more quickly turned to useful purposes, and a stimulus is given to the production of more. But a banker deals not only with the money of others; he uses money belonging to himself. This is his *capital*. Few would be found to deposit their money with a person known to possess none of his own. If he should lend deposits to those who fail to repay them—that is, *make bad debts*—he has the means from his capital of replacing the deposits thus lost.

The services that a banker performs as the cash-keeper of his depositors are very great. In the case of persons not themselves in business, it is

quite usual for a banker to make all their money-payments, beyond their small daily expenditure, and to receive the money payable to them. The money transactions of such persons are thus contained in their banker's books. This is effected by the depositor giving cheques or orders on his banker for the sums he has to pay; and by handing to him all the *cheques* or orders the depositor receives for sums payable to himself. Suppose a person's income derived from dividends on government stock: he may give a *power of attorney* or authority to his banker to uplift the dividends for him. These are received by the banker as deposits, and are drawn out by the depositor as occasion occurs, by cheques issued by the depositor to those to whom he requires to pay it away. So he may receive money due to him by a cheque given to him by his debtor. This cheque he sends to his banker, who will obtain payment. If both persons deal with the same banker, a simple transfer in his books will carry through the transaction; and if the bankers be different, and each has received, in the course of his business, as is always happening, cheques on the other, there will be a set-off between them; and two payments will be made as well as two deposits, without trouble to the persons concerned, and without the employment of any money. But this mode of managing one's pecuniary transactions is not confined to the case of those not engaged in business; on the contrary, it is followed on a scale out of all proportion greater in carrying through the money transactions of those in business or trade in the principal industrial countries.

Besides thus performing the function of cashiers to their depositors, many banks allow interest on deposited money. The rate allowed is, of course, always less than that received by the banker. Frequently a depositor bargains with the banker not to draw out his deposit without previous notice, longer or shorter as may be agreed on; and in this case the banker will allow a higher rate of interest than when the deposit is repayable on *call*—that is, at any time, without previous notice. The practice of allowing interest on deposits has prevailed in Scotland since 1729, but in England is of later growth, and not invariable; the rule there being rather to allow interest on fixed deposits only, and to allow no interest on money at call or on current accounts. It has led, of late years, to a great increase in the amount of deposits. Many persons are content with the low rates of interest which banks give, in place of the higher rates which may be obtained from individual borrowers, or the greater return which may be received if they traded on their money; believing their money to be safer and more readily obtainable.

Occasions are always occurring for withdrawing deposits, as well as making them. Traders and commercial men, for example, day by day, deposit with their bankers the drawings or sums of money which they receive in the course of their business; and, on the other hand, day by day, draw out such sums as they require to pay away in purchases of goods, in wages, rent, and other expenditure. A bank, therefore, while continually receiving deposits, is continually repaying deposits; and the amount uncalled for is subject to a daily fluctuation. At one period of the year, or in a certain condition of trade, the amount of deposits may be high; at another, low. As it is a principle, at the very root of banking, that money deposited shall be returned, either on demand, or punctually at the expiry of a stipulated notice, it follows that banks must always have in their coffers as much of the money deposited with them as there is the least likelihood of being called for by depositors. When business is in its ordinary condition, a bank can,

after some experience, approximate pretty nearly to the amount of the greatest demand for a return of deposits throughout the year, and provide accordingly. But sometimes the credit of a bank becomes doubted, either from causes peculiar to itself, or on occasions of a *panic* or general distrust, when all who own money wish to have it in their own possession. In these cases, there is a *run* on the bank for repayment of its deposits, and the amount called for may be far beyond the maximum demanded in ordinary times. If the bank has not retained in its coffers, or held otherwise, available funds sufficient to meet the demand, it is said to *suspend payment*; and, as a general rule, it must wind-up its business; the confidence of the public that it will in future restore its deposits on demand being now destroyed. There are two prime rules in safe banking: the one is, that the bank shall lend its deposits only on undoubted and readily realisable securities, however low the profit; and the other is, that the bank shall retain a sufficient amount of its resources—and this is called the *banking reserve*—to meet the possible demands of the depositors, even in cases of a run, although there may be no reason to expect one; for when a run comes, it seldom casts its shadow before. But it is evident that the greater the *reserve* of a bank, the less the amount of deposits which it can lend out and draw interest for; hence the temptation which banks lie under of imprudently lending out too great a proportion of their deposits; and it is yielding to this temptation which almost always precipitates the failures of banks.

The *reserve* of the banking department of the Bank of England is always in coin, or, what is the same thing, in notes against which there is coin lying in what is called the *issue* department of the Bank. In the case of all other banks in this country, the reserve is only partly in coin; sometimes the proportion of coin is very small. A great portion of the reserve is generally in Bank of England notes (except in Scotland and Ireland), equivalent, of course, to coin. A portion is invested in the shape of government stock. In this way, the banks obtain a return on a portion of their reserve, in the dividends or interest paid by government on the stock—this return being less, indeed, in the usual case, than if the bank had lent out the money in the ordinary course of business, but better than no return at all, as must be when the coin or notes are lying idle. The reason why government stock, in Great Britain, is a safe reserve is, that it is sure to command a purchaser at all times. If there be a run on a bank, it immediately finds a purchaser for the stock, and with the price, whether paid in gold, or in Bank of England notes, the only other legal tender, it meets the demands of its depositors. Sometimes a bank has its reserve in the form of a deposit at the Bank of England; or, if a provincial bank, with some London bank which has its own reserve there. From the Bank of England being the channel through which, directly or indirectly, payments are made and moneys received by other banks, it is more convenient for them to have their reserve lying as a deposit in it, than lying as gold within their own walls. In the case of a demand on their reserve, the banks will draw out their deposits, in notes, or, if gold be in demand, in gold, from the Bank of England. Whether, therefore, the reserve of a bank is invested in government securities, or is deposited in the Bank of England, or is in Bank of England notes, it is from the coin in that bank that the gold comes in the case of a run. It is apparent from this that it is essential to the stability of all banks in this country, so long as they themselves do not keep a sufficient reserve of coin in their coffers, that the Bank of England shall

always be possessed of coin, and never be unable, on demand, to pay its depositors in gold, or to give gold in exchange for all its notes that may be presented to it. It may be added, that while banks gain, through the annual dividends, in keeping their reserve in government stock, they run the risk of loss in the event of their requiring to sell in times of panic. For at such a time, when many securities become unsaleable; and all of them suffer depreciation in value, government stock itself falls in price, although less so than the others. Banks often invest portions of their reserve in other stocks than government stock. The higher return thus obtained is, however, outweighed by the greater risk of depreciation in value in times of panic.

Banks make their loans chiefly in the form of *discounts*—that is, upon bills of exchange. Commodities in the wholesale market are generally sold on credit. The buyer promises to pay the amount at a certain date to the seller, and his promise is contained in a bill of exchange. The seller transfers it to a bank, which, on the faith of it, advances the amount in loan to him, less *Discount* (q.v.)—that is, interest of the money till the bill be due. This is called *discounting*. But banks lend on other securities. A holder of government stock, for example, will obtain a loan on the security of his stock; the banker being entitled to sell it, and repay the loan from the price, if the borrower fail to make punctual payment. So also, the holder of stock or debentures in any public company, as a railway, will, where the company is believed to be in a sound condition, or the security is saleable, and no liability attaches to it, obtain a loan from a bank. The owners of commodities lying in a public warehouse may obtain a loan on depositing with the bank the *warrants* or certificates of ownership. Loans, too, are occasionally made for short periods on the mere note of hand of the borrower, when the banker is satisfied of the ability of the borrower to repay the money. It is seldom in Scotland that banks lend on mortgages over land. Borrowers, in these cases, generally take loans to lie unpaid for a few years; but to have his money locked up in that way does not suit the business of a banker. Where a banker finds the security which he has received to be insufficient, and repayment of the loan is not forthcoming, he will, of course, to avoid making a bad debt, take any other security the debtor can give him—such as a manufactory or a mine. Banks have in this way occasionally become involved in manufacturing and mining transactions, in order to make more money of the securities than they would have done by an immediate sale of them; and have suffered great losses in consequence. It is not to be supposed that banks always abstain from making loans when the security is known to be doubtful; far from it: banks, like other commercial establishments, have been, on many occasions, recklessly managed. In trying to push business, they have made loans on insufficient security; and banks are under strong temptation, when a trader largely indebted to them is approaching bankruptcy, to sustain his credit by additional advances, in the hope that he may retrieve his affairs, and pay in full both the old and the new advances. The result is often the loss of both. Conduct of this kind has been the ruin of many banking establishments in England, of several in Ireland and Scotland, and elsewhere.

We have hitherto been treating of the *deposit* and *loan* departments of banking; but many banks also *issue notes*. In the case of loans from capital, the banker has no greater profit by the transaction than if he had lent out his money in any other way, equally safe, and involving the same amount of trouble. If from deposits, the interest he receives, in

so far as it exceeds the interest, if any, paid to the depositors, and a rateable proportion of the expense of carrying on the business of the bank, is pure gain to him. But a banker may give the loan from his own notes, and in that case his gain is still greater. A bank-note is simply a printed promise by the bank issuing it, to pay to the bearer, on demand, a sum of money—that is, in coin of the realm. Of course, the borrower would not accept a loan from a bank in its own notes, unless he believed that it could redeem its promise of paying in coin, and that the public were of the same opinion; for whenever a suspicion arises that the promise will not be made good, the note ceases to pass from hand to hand as freely as coin. But (under a system of free issue) when the loan is accepted in a bank's own notes, it is evident that the interest which the bank draws for the loan of its promises to pay is pure profit, except the rateable proportion—as in the other cases—of the general expenses, the cost of manufacturing the notes, and the government stamp-duty. In other words, a bank whose issue of notes is unrestricted, draws nearly as much income from loans of its promises to pay, as from its loans in legal tender. The motive which a bank has to extend its issues on loans is therefore apparent, so long, of course, as it is not compulsory on it to retain unemployed in its coffers as much in gold as it issues in notes. Unrestricted issues are now, however, a system of the past.

But it does not follow that when a bank makes a loan in its own notes for a definite period, it will really obtain the benefit of the whole of the interest on it for that period; for the borrower does not apply for the notes that he may keep them beside him, but that he may pay them away in making a purchase, or in liquidating a debt, and this, most commonly, on the very day he receives them. If the person to whom the notes are thus paid by the borrower has himself no payment to make, he may return them to the bank that issued them, to lie there on deposit. If the bank pays interest on deposits, as most banks do, then out of the interest drawn by it on the original loan, it will have to pay interest to the depositor of the notes; in other words, the loan is no longer a loan of notes, but a loan from deposits. Or the person receiving the notes from the borrower may immediately present them to the issuing bank for coin, instead of depositing them. Here, too, the loan that was made in notes is converted into a loan of coin, that was in reserve from previous deposits, or that was part of the bank's own capital. In these cases the bank obtains no advantage whatever in having made the loan originally in its notes. It might equally well, so far as profit is concerned, have originally made it in gold from its reserve of deposits or capital. Notes generally find their way back to the issuing bank through other banks, into which they have been paid as deposits, or in repayment of advances. These banks suffer the loss of profit or interest on the amount of the notes thus received by them so long as they keep them; they therefore immediately present them to the issuing bank for payment, that they may get the use of the money represented for the purposes of their own establishments.

There are two checks which prevent a bank issuing notes to any extent it pleases. In the first place, there must be a demand for its notes by borrowers. It is only to people in good credit, and likely to make a profitable use of them, that a bank will lend its notes, and such people will not take an increase of loans unless trade be increasing, and new opportunities be presenting themselves for profitably employing the notes borrowed. True, banks, when imprudently conducted, frequently lend to reckless persons, who overtrade and become bankrupt. But this is not done more through the

medium of the notes than otherwise. In the second place, the immediate return of the notes, chiefly through other banks, is a check to its issuing more notes than it has a reserve to meet. This return of notes through banks is called the *exchange* of notes—the notes issued by a bank being returned to it in exchange for the notes of other banks held by it.

Besides issuing its notes in loans, a bank may issue them in repayment of deposits. In this case, there is the same profit to the bank as in the other case. The bank gets the use of the money which was originally lodged with it, without having to pay interest for it, the deposit having now been repaid in its notes. But here, too, these notes are equally liable to be returned to the issuer as when they are issued on loans.

Of all the notes issued, in whatever way, by banks, a certain amount is not returned to them, but is kept in circulation, being what is required by the necessities of the public for use as money, passing from hand to hand. It is of course on this portion that the banks make their profit; and, in consequence of this profit, they are able to afford banking facilities to the public more cheaply than they could otherwise do. The profit is just the interest on the money represented by the notes in circulation—less expenses and the loss of interest on an unemployed reserve kept from prudence, or by the requirement of law, to meet a return of notes. This interest is paid by the persons who originally borrowed these notes from the banks, and who have not repaid them; or if the banks have repaid deposits with the notes, the interest is paid by those to whom they lent what was originally these deposits. The amount of the bank-notes in circulation varies at different periods of the year; at term-times and quarter-days, when more payments than usual are made, there is a greater quantity of money required by the public than at other times, and the notes in circulation increase in amount. This addition to the circulation is drawn from the banks by depositors or borrowers. After it has served its purpose, this additional quantity gradually returns to the banks as deposits or in repayment of loans. If the credit of an issuing bank is at any time suspected, the holders of notes will present them for gold, just in the same way as its depositors will call for a return of their deposits; and this risk must be provided against by a corresponding increase of its general reserve, on which, of course, it makes no profit. It has been generally imagined that when issuing banks suspend payments on a run, the run is one on the part of their note-holders; but this is only a popular error. In a well-established bank, the amount of its notes in circulation is of little importance compared to its deposits; and though the holders of small sums in notes may be more apt than depositors to take alarm and rush in a panic to the bank for gold for its notes, a small proportion of its depositors suddenly demanding a return of their money in gold as effectually drains a bank of its reserve, as if its whole circulation were to be at once presented to it for gold.

Bankers perform another very important function: they *remitt* money from one place to another. One illustration will serve to explain how this is managed. A debtor in Edinburgh makes a payment to his creditor in London in this way: he pays the money to a banker in Edinburgh, who, for a small charge, called the *exchange*, gives him a draft for the amount on a banker, his correspondent, in London. The debtor transmits the draft to his creditor, who presents it to the London banker, and receives the money from him. No actual transmission of the money, however, takes place, for there are debtors in London requiring to

pay money to creditors in Edinburgh, and these debtors effect the payment by giving the money to the London banker, and obtaining his drafts on the Edinburgh banker. The one set of drafts are thus set off against the other. Not only may remittances between two places be thus made without the use of money, but the payments in both places may also be made without it. The debtors may pay for the drafts by cheques on the banker who grants them, and the creditors may get the drafts placed to their credit, and receive the money by drawing cheques on the banker by whom they are made payable. For another function of banks, see MARGINAL CREDITS.

The large amount of money transactions carried through without the intervention of coin or bank-notes, in a country like England, is inconceivable to those not engaged in business pursuits. The manner in which these transactions may be effected without money, would be at once apprehended, if all persons in the same locality dealt with the same bank, and if all the banks scattered throughout the kingdom were only branches of the same establishment. But in practice matters are so managed as if this were the case. The cheques, bills, or other drafts which come into the hands of a banker, drawn on (that is, payable by) other bankers, are set off and liquidated by drafts, which they have received, drawn on him. The balance or difference only is paid in money. In London, the centre of the money-world, there is an establishment called the Clearing-house (q.v.), of which most of the London banks are members. There, at a fixed hour daily, attendance is given by a clerk from each of these banks, who presents all the drafts immediately payable which his bank holds on the others; the balance or difference, on the whole, for or against each bank is ascertained; and the bank which holds a less amount of drafts on others than they hold on it, pays the difference by cheques on the Bank of England. For the nineteen years 1868-86, the average total amount of documents passed per annum was £5,305,234,000; the lowest annual total was £3,425,185,000 in 1868; and the highest, £6,357,059,000 in 1881. There are similar clearing-houses in some provincial towns.

Bank of England.—This bank, the most important in the world, was projected by William Paterson (q.v.), and was incorporated July 27, 1694. It was constituted as a joint-stock association, with a capital of £1,200,000, which was lent at 8 per cent. interest to the government of William and Mary, at the time in a state of embarrassment. At its very outset, therefore, the Bank of England was a servant of government; and it has retained this character, but in a diminishing degree, through all the stages of its subsequent history. At first, the charter of the bank was for eleven years only; but in consequence of the great services of the institution to government, its charter has been at various times renewed. The last renewal was in 1844, and the charter of that year still subsists, its terms being subject to modification or revocation by the legislature at pleasure. By the Act or charter of 1844, the Bank was divided into two departments—the *issue* and the *banking*. What led to the division was this: it was supposed that, when a foreign drain of gold from England set in, it would, if the currency or circulation in this country had been purely metallic, have produced a contraction of the circulation, and a consequent fall of prices, and, as an ultimate result, the cessation of the drain. It was further supposed that banks could issue their notes to any extent they pleased; that their excessive issues increased the currency, and therefore increased prices, which in their turn led to foreign drains; and that, on the occasions of these drains, the continued issues prevented the natural

and desirable contraction of the circulation, and aggravated the commercial convulsions occurring at such periods. The object of the Act of 1844 was to prevent issues of notes beyond a certain amount, unless against an equal amount of gold held by the issuing bank, so that the mixed currency of notes and coin might thus expand and contract like a self-acting metallic currency. Experience, however, has shown, that when these foreign drains occur, the gold exported is taken chiefly from the reserves in the Bank of England, being payments of deposits or loans by the Bank; and that the amount of notes in the hands of the public has not been affected by the legislation of 1844. In practice, whenever there are signs of a foreign drain, and the reserve of the Bank is diminishing, the Bank counteracts the tendency to a drain by raising the rate of discount and restricting its loans; the purchasing power of the public is thereby limited, and prices kept down; and, at the same time, gold is attracted to this country for investment. The circulation is in reality not interfered with. It was also intended by the Act of 1844 to add to the security of bank-notes by insuring a supply of gold to meet the payment of them at all times. But the solvency of the Bank of England is undoubted; and its notes would at any time be taken as gold. This intended effect of the Act of 1844, and the supplementary Act of 1845, has in the case of the notes of other banks been hitherto inappreciable.

In the *issue* department of the Bank of England, the sole business is to give out notes to the public. Before the separation of the departments, the government was due to the bank £11,015,100. This sum was declared to be a debt due to the issue department, and for the issues of notes to that amount, no gold requires to be held by it. This was just the same thing as if the Bank had originally lent £11,015,100 of its notes to government, and these notes had found their way into circulation. The Bank was also allowed to issue additional notes on securities—that is, to lend them to a limit which in September 1887 amounted to £5,184,900, and this without holding gold. The amount of notes which may thus be issued, without gold being in reserve against it, is £16,200,000. All notes issued above that amount can be issued only in exchange for gold. At the passing of the Act in 1844, the limit of notes to be issued against the government debt and securities was fixed at £14,000,000—past experience having shown that there was no risk of there being at any time less than that amount of Bank of England notes in the hands of the public. The addition of the £1,750,000 is an extra issue, authorised by the act, in consequence of certain issuing banks having since ceased to issue. The Bank has to account to government for the net profit of this extra issue of notes, and the profit the Bank derives from its issue department is the interest received on the £14,000,000 of government debt and securities, which, at 3 per cent., is £420,000 yearly. But out of this the Bank pays to government, for its banking privileges, and in lieu of stamp-duties, £180,000. If we assume the expense of the issue department to be £160,000, the net profit upon it would be £80,000. The Bank also makes a profit upon gold bullion and foreign coin, averaging £15,000 a year. These are brought to the Bank for notes; they are worth £3, 17s. 10½d. per ounce; but the Bank is obliged by its charter to purchase them at £3, 17s. 9d. The holders prefer taking this price to having their gold coined, free of charge, at the public mint, as the delay in the coining is equal to a loss of interest of 1½d. per ounce. The amount of notes in the hands of the public averages about £25,000,000; but the amount issued by the *issue* department is greater. The difference is the

amount lying in the *banking* department, and represents the reserve of gold of that department; that is to say, the banking department retains only about three-fourths of a million of coin, and transfers the bulk of its reserve to the issue department, in exchange for notes. We therefore require to regard the reserve of the banking department as gold, though lying in the shape of notes issued by the other department.

Viewed in its *banking* department, the Bank differs from other banks in having the management of the public debt, and paying the dividends on it; in holding the deposits belonging to government, and in making advances to it when necessary; in aiding in the collection of the public revenue, and in being the bank of other banks. For the management of the public debt, the Bank receives about £247,000 a year, against which there has to be set £124,000 of charges. The remaining profits of the Bank are derived from its use of its deposits, on which it allows no interest, and of its own capital. The capital was originally £1,200,000; in 1816 it reached £14,553,000—the present amount. There is besides a rest of about £3,200,000. Public deposits vary from £3,500,000 to £20,000,000; private deposits from £20,000,000 to £30,000,000. In January 1887 the public deposits were £4,189,856; the private, £23,717,053.

In 1797 the Bank found itself likely to be obliged to suspend payments, and its notes were declared by law a legal tender, although no longer convertible into coin. This state of matters continued till 1821. The notes during this interval not having been convertible into coin on demand, there was no check upon the Bank in the amount of its issues; and the currency became depreciated—that is, a £5 note would not exchange for five sovereigns; and every man to whom £5 was due, was thus obliged to accept payment in a £5 note, not worth £5. It is, however, said that the value of gold at the time was enhanced owing to absorption by hoarding and by military chests, and that the depreciation was more apparent than real. The export of gold following on a rise of prices occasioned by an issue of bank or government notes is unlimited, except by exhaustion, if these notes are not payable in coin on demand, and are issued without any check from without or self-imposed. But as prices estimated in these notes rise, the price of bullion, like other commodities, rises too, and the price of coin which can be converted into bullion, or be used abroad at its previous purchasing power, rises also. Since 1821 the Bank has been oftener than once on the verge of a suspension of payments, owing to foreign drains of gold. The separation of the Bank into two departments is regarded by many as having a tendency to produce a suspension in times of panic, when the reserve is reduced by withdrawals to supply a foreign drain, or to meet an internal run. Before the separation, the Bank, in the case of withdrawals of gold, had the whole amount of gold within the Bank to meet them; but now it loses the command of all the gold in the issue department. It cannot get that gold unless in exchange for notes, but, its reserve being reduced or exhausted, it has none to spare. The restriction of credit consequent upon the approach to an exhaustion of the reserve of the banking department, is so great, that the fear of it occasions a panic. In 1847, 1857, and 1866, on the possible suspension of payments by the banking department, owing to a reduction of its reserve, being apparent, the government of the day took the responsibility of authorising the Bank to lend additional notes, not represented by gold. This was an indirect way of giving borrowers the use of the gold in the issue department. In 1857 it was found necessary to take the benefit of this authorisation.

The Bank of England is situated in the centre of

London; but it has a branch in the west end, and nine branches in the provinces.

Joint-stock Banks in England and Wales.—In 1887 there were 118 of these banks, of which 42 in the provinces were entitled to issue notes to the amount of £2,114,513 without its being compulsory to hold any gold against them. But as they are prohibited from exceeding their authorised issue, the amount of notes actually in the hands of the public is always somewhat less. The deposits of the 11 joint-stock banks in London which may be considered London banks, and excluding the National Provincial Bank of England, and other provincial and Scottish banks, which, although they carry on business in London, have the great bulk of their business elsewhere, amount to about £105,000,000, and the acceptances granted by them to about £12,000,000. Their paid-up capital is £13,005,000. Under the Companies Acts, 1879 and 1880, most of the principal joint-stock banks have become limited liability companies. They usually allow interest upon money deposited to remain for some time.

Private Banks in England and Wales.—Of these there were 248, of which 77 were in London. Of the provincial banks 96 had an authorised issue of £3,398,608.

Banks in Scotland.—The earliest banking institution in North Britain was the Bank of Scotland, instituted by an Act of the Scots parliament in 1695. The original capital was £1,200,000 Scots, or £100,000 sterling. In 1774 the amount of stock was extended to £200,000 sterling; now it is £1,875,000, of which £1,250,000 is paid up. In 1727 a new and similar establishment was constituted by royal charter under the title of the Royal Bank of Scotland, whose advanced capital is now £2,000,000. In 1746 another association was formed, and incorporated by royal charter, with the title of the British Linen Company. From £100,000, its capital has increased to £1,000,000. Besides those three banks, there are in Scotland other seven joint-stock banking companies, with capitals varying from £1,000,000 to £150,000. There are now no private banks. The amount of deposits is over £80,000,000, on which interest is allowed. Their authorised issue of notes is £2,676,350, but their actual issue is more than double that amount. The Western Bank, with a capital of £1,500,000, a circulation of above £400,000, having 1300 shareholders, and about 100 branches, suspended payments in 1857, owing to reckless management. The shareholders, however, being under unlimited liability (see COMPANY), neither the depositors nor the note-holders sustained any loss. In October 1878 the City of Glasgow Bank, with 133 branches, suddenly suspended payments; the liabilities amounting to £12,400,000, and the estimated assets, £6,300,000, leaving a probable deficiency of £6,100,000, including the capital. It was found that for three years before the stoppage, the states of the bank's affairs, issued annually to the shareholders, had been falsified, and that advances had been made to four firms against utterly inadequate securities, to the enormous sum of nearly £6,000,000. The directors and the manager were tried for and convicted of uttering false balance-sheets, and sentenced to imprisonment. It was arranged to wind up the bank by liquidation; and though the calls made upon the shareholders involved large numbers of them in utter ruin, in four years the liquidation was complete, after a payment of £13,644,856. The Caledonian Bank temporarily suspended payments. In 1882 the five non-chartered Scottish banks, and the two whose charters involved limited liability, became limited liability companies.

In consequence of allowing interest on deposits,

the banks in Scotland may be said to hold the whole capital of the country, minus only the money passing from hand to hand. This system of depositing is aided by branches from the parent banks, and these branches are found in every small town. The entire number of branch-banks in Scotland in 1887 was 945. At these branch-banks, the agent discounts bills within certain limits, issues letters of credit, and pays out notes, and also gives cash on demand for them; though, strictly, the notes of a bank are only payable on demand at the head-office. By a strict system of supervision, Scottish branch-banks are usually well conducted, and are of great service in every department of trade. Forgeries of Scottish bank-notes are now very unusual.

The banks in Scotland, like those in Ireland, but unlike the provincial banks in England, are allowed to issue notes beyond their fixed issues, on holding gold equal in amount to the extra issue. But the gold thus retained is, like the other gold in reserve, liable for the deposits and general liabilities, as well as for the note circulation. Thus the security of the notes is increased only in a small degree by this arrangement, which, apart from the loss of profit to the bank on the gold unemployed, is attended with inconvenience at those seasons when the circulation is extended, as gold has then to be brought from London for the temporary purpose of covering the extension of issues. In Scotland, and Ireland also, banks can issue one-pound notes; the English banks are not permitted to circulate notes of less value than £5.

Besides employing money in discounting bills, the Scottish banks grant loans of fluctuating amount, called *cash-accounts* or *cash-credits*. By this system an individual is entitled to draw out sums as required, to a stipulated amount, and by an implied condition to make deposits at his convenience towards the liquidation of the same. On entering into this arrangement, he finds security to the bank that he will repay to the bank, whenever called on, the balance of sums drawn out, less those paid in, with the interest that may be due. These accounts are balanced yearly like current or deposit accounts. The only difference between the latter and a cash-account on the face of them is, that if the credit allowed on the cash-account is being made use of, the balance is in favour of the bank; whereas, on the other kind of accounts, the balance is in favour of the bank's customer.

Banks in Ireland.—There are nine joint-stock banks, having 454 branches and sub-branches. Their authorised issue is £6,354,494; of which £3,738,428 is that of the Bank of Ireland. It is a national bank, lending £2,630,769 of its capital to government. It was established in 1783, with privileges resembling those of the Bank of England. Its capital is £3,000,000 Irish currency, or £2,769,230, 15s. 5d. sterling, and its rest £1,034,000. The capitals of the other banks vary from £142,766 to £1,500,000, and the total capital of the joint-stock banks in Ireland is £6,901,996. Six are banks of issue. The amount of deposits in the joint-stock banks in Ireland in 1886 was £33,301,392. All the joint-stock banks are limited companies. Interest is allowed on money deposited for a stated period, but not on money at call, or as a rule on current accounts. There are also three private banking firms in Dublin.

Savings-banks are the subject of a separate article.

Foreign and Colonial Banks.—There are on the continent of Europe public or national banks, joint-stock and private banks. The national banks are, more or less, government establishments, managing the public debts and finances, and, unlike the Bank of England, subject to government influence and interference. The Bank of France was estab-

lished in 1803 under Napoleon, by the amalgamation of three local firms. It is directed jointly by representatives of the state and of the proprietors; and has a capital of £7,223,958, public liabilities to the extent of £145,000,000 (of which about £112,000,000 are notes), and 94 branches, with 112 subsidiary offices. Its discounts are enormous in number, but small in average amount. The Imperial Bank of Germany (Reichsbank) resembles the Bank of France in constitution, and was established in 1875 as a reorganisation of the Bank of Berlin. Its capital is £8,000,000, with a reserve fund of £1,067,800; its other liabilities amount to about £55,000,000 (of which £35,000,000 are notes); and it has 210 branches. There are many other issuing banks throughout the empire.

There are 60 foreign and colonial banks in London, of which 34 are British companies. Besides these, 132 are represented by London bankers. In India and the British colonies there are joint-stock banks and private banks. In Australasia especially, banking has assumed large and solid proportions.

United States.—In the United States the functions of the banker are essentially the same as in Great Britain, and the many experiments that have been made in banking since the settlement of the country afford an interesting study for the financier. As early as 1652, in the colony of Massachusetts Bay, the subject of the establishment of a bank was discussed, and 34 years later (1686) permission was given to a company to issue bills of credit on the security of real and personal estate. About 1712 an institution known as the Land Bank came into existence in the same colony, and in spite of the fierce opposition of governors and councils it prospered for many years. Several other banking schemes were projected in the different colonies, but in general they appear to have met with little success. At length the breaking out of the revolutionary war led to the establishment, by recommendation of congress, of the 'Bank of North America,' which was chartered by several of the states simultaneously, and which, though a state institution, rendered the general government efficient assistance during the war.

In 1791, at the instance of Alexander Hamilton, congress established the first 'United States Bank,' with branches in several states, its capital being fixed at \$10,000,000, one-fifth of which belonged to the government. From the outset this scheme met with much opposition, particularly from Mr Jefferson and his political adherents, and at the expiration of the twenty years for which the charter was granted, congress refused to renew it, and the institution went out of existence. Five years later (1816) a second United States Bank was chartered with a capital of \$35,000,000. This bank was the depository of the government funds until the accession of General Jackson to the presidency, when they were arbitrarily removed, and an act of congress rechartering the institution vetoed by the president.

Meanwhile, numerous state banks had sprung up, but their issues as a circulating medium were at times subject to a heavy discount as compared with gold; and the high rates of exchange between the various sections of the Union, though affording a profit to dealers in funds, were a source of great annoyance in mercantile transactions. Various attempts were made to obviate these inconveniences, such as the establishment of a bank of redemption in Boston, which was expected to receive deposits of the issues of distant banks in exchange for its own notes; the establishment of a safety-fund system in some of the states (a virtual insurance against loss by the holders of the issues of the banks doing business under the laws of the

respective states); and finally the free banking system, under which speculation ran riot, and financial disasters followed each other with alarming frequency. In the panic of 1857 occurred an almost universal suspension of specie payments.

The occurrence of the civil war (1861-65) necessitated, in the opinion of the secretary of the treasury (Mr Chase), the creation of a national banking system; and although his suggestion met with some opposition from the state banks, an act was finally passed authorising the issue of \$300,000,000 in bank-notes (afterwards increased to \$354,000,000) based on United States interest-bearing bonds, to be purchased by the banking institutions, and held by the government as security for the redemption of the funds furnished to the former for circulation. On the outset new associations were for the most part organised to conduct this business, but subsequently nearly all of the old state banks reorganised under the national system, and the result has been to furnish a stable currency of uniform value throughout the Union.

See Lawson, *History of Banking* (1855); Gilbart, *History and Principles of Banking* (2 vols. 1881); Hutcheson, *The Practice of Banking* (3 vols. 1880-1887); Palgrave, *Notes on Banking* (1873); Agar, *Questions on Banking* (1886); Kerr, *History of Banking in Scotland* (1884); Rae, *The Country Banker* (1885).

Bank-notes, MANUFACTURE OF. The chief thing to attend to in the manufacture of bank-notes is the rendering of their forgery impossible, or at least easy of detection. This is sought to be effected by peculiarity of paper, design, and printing. Bank of England notes are printed in one of the blackest and most indelible of inks on paper expressly made for the purpose by one firm only. It is a hand-made paper, remarkable for its strength, lightness, and difficulty of imitation. Its peculiar water-mark constitutes one of the chief safeguards of the notes against forgery. No Bank of England notes are issued twice, so that this mark is rarely indistinct, and the paper does not lose its peculiar crispness. Some years ago a self-registering machine was invented for impressing on each note a distinctive mark known only to the bank authorities. Owing to some of the notes of the Scotch banks printed simply in black ink having been successfully forged by photography, those issued by them have since 1858 been printed in coloured inks, at least two colours being used for each note. In order still further to lessen the risk of forgery, a new kind of note was in 1885 issued by the Bank of Scotland, printed in brown, yellow, and blue. The paper is of a similar kind to that used for the Bank of England notes, with an elaborate and easily recognised water-mark. In 1887 the Commercial Bank of Scotland also issued a note of new design, printed in yellow and blue on the face, and with a dark brown device on the back. Foreign bank-notes are also printed in coloured inks. The actual cost of one-pound notes is as nearly as may be one penny each, and of larger notes only a fraction more.

Between 1837 and 1855 the plan of Perkins and Heath for reproducing an engraved steel plate by the use of the mill and die continued in use in the Bank of England. The pattern is engraved on a soft steel plate, which is then hardened, to transfer the pattern by pressure to a soft steel roller, on which, of course, the pattern is produced in relief; the roller or mill is then hardened, to reproduce the pattern in the plate from which the printing is to be done; and thus almost any number of plates for all common purposes can easily be produced.

In 1855 electrotype-printing was introduced by

Mr Smee, with the assistance of the mechanical officials (see ELECTROTYPING); and since that time, the notes of the Bank of England have been all produced by surface-printing from the electrotype.

The number of notes produced and issued by this bank sometimes amounts to 300,000 per week. There are seventy or eighty kinds of Bank of England notes, differing in their denominations or values, but similar in the mode of printing. Zinco-graphy and lithography are employed by some banks for the printing of their notes; and also *acierage*, a mode of hardening copper electrotypes with a thin surface of steel.

In the United States, the bank-notes at present in circulation are manufactured by the government bureau of engraving and printing, the paper being made by a private concern under a patented process, the chief ingredients being a mixture of linen and cotton fibre, into which are introduced threads of silk, so arranged as to be perceptible after the notes are printed. This style of paper is furnished only to the government. Superior skill is exercised in engraving the plates, nearly all parts of them being executed by the geometrical lathe and the ruling-engine, the work of which it is impossible to imitate successfully by hand. The printing of the notes is done in coloured inks of the best quality, sometimes as many as four shades being used. The great expense of the machines used in the engraving, and the superior quality of the work generally, renders successful counterfeiting almost impossible. The notes when badly worn are returned to the United States Treasury, other notes being issued in their stead. See GREENBACKS; and for the question of a paper-currency, see CURRENCY.

Bankruptcy, or INSOLVENCY, is the state of a person declared to be unable to pay his debts. In England, insolvency is a term which had, till the distinction was abolished in 1861, long been confined to the case of a non-trader who was unable to pay his debts. All who were *traders* were said, in the same circumstances, to be, not insolvent, but bankrupt. Different courts, called the Bankrupt and the Insolvent Courts, were applicable respectively to these two great divisions of mankind, traders and non-traders. In the case of traders, the Court of Bankruptcy was the court to which they or their creditors applied. That court, whenever a trader was unable to pay his debts—certain tests of which inability were called acts of bankruptcy—on the application of a creditor, took forcible possession of his property or his assets of every kind, converted these into money, and distributed the proceeds impartially among the creditors, according to certain rules, at the joint expense of the creditors. In the course of doing this, the court required the bankrupt to state all the property he had, where it was, and to give explanations as to what had been lately lost; and it was a crime for him to conceal or make away with any part of his property to the prejudice of this impartial distribution. The creditors also came in and proved their debts against his estate, thereby showing their title to share in it. In this way the debtor was entirely stripped of everything (with a few trifling exceptions) which he had, and which was saleable; and, on the other hand, he received a certificate which entirely cleared him of the encumbrance of his past debts for ever—freed him not only from imprisonment, but even from the liability to pay more in future, should he afterwards become rich; and he could thus begin the world anew.

On the other hand, the non-traders, who consisted of country gentlemen, professional men, gentlemen at large, and nondescripts of every degree who were not traders, fell under the care of the Insolvent Court. These non-traders petitioned the court

voluntarily, instead of their creditors doing so, as was the case in the Bankrupt Court, and they of course put off this application till the last, when they were in prison, though they might also petition before any creditor put them in prison. The sole condition on which the Insolvent Court granted them its protection, and discharged them from prison, was, that they should not only give up all their property, but state fully all the debts and liabilities they had incurred. If they did this satisfactorily, the court relieved them from imprisonment, but did not entirely free them from the debt they had incurred. On the contrary, they were still liable for their debts; and if ever they should in future become rich enough to pay twenty shillings in the pound, they were still held liable to make up that amount. This contingency, however, seldom happened, and, moreover, when it did happen, considerable leniency was shown to the debtor, so that practically, both in bankruptcy and insolvency, the debtor was discharged, and was at least saved from imprisonment. The bankruptcy laws date from the time of Henry VIII., and the insolvency laws from the time of Elizabeth, the distinction as above explained having always been kept up between them till the statute of 1861. By that statute the Insolvent Court was abolished.

Important changes were made in the practice of bankruptcy by the Act of 1869, which repealed the prior enactments and rendered the law more uniform. Under that act non-traders as well as traders might be made bankrupt; and even peers of the realm not only might be made bankrupt, but, on being declared so, were at once disqualified from sitting and voting in the House of Lords till they received their discharge. Another Act provided that a peer commits a breach of privilege if he sits or votes, or attempts to do so, while thus disqualified. And if he is a representative peer, a new election must take place when he becomes bankrupt. But a much more complete and beneficial change in bankruptcy administration was made by the Bankruptcy Act, 1883, 46 and 47 Vict. chap. 52. That act abolished the Special Court of Bankruptcy, and transferred its jurisdiction to the High Court of Justice, the Lord Chancellor selecting one of the judges to transact that class of business. The petition is presented in the High Court if the debtor resides in the London district, or if he is not resident in England, or if the creditor does not know where he resides. The London district includes all the area of the ten metropolitan county courts. The rest of England is divided into separate jurisdictions, and the judge of each county court is the ordinary judge. A large part of bankruptcy jurisdiction, however, both in the High Court and the County Courts, is exercised by the registrars, who hear the petitions, hold public examination of debtors, and even approve of compositions and grant discharges, when these are unopposed. There is an appeal from the County Courts to a Divisional Court of the High Court of Justice, in which the bankruptcy judge is sitting, and in the general case there is no further appeal (Bankruptcy Amendment Act, 1884). The ordinary right of appeal remains as regards the original jurisdiction in bankruptcy of the High Court. All bankruptcy courts have very large and useful discretionary powers in dealing with procedure. The comptroller used to keep a register of all bankruptcies, showing the state and progress of each. He has now been transferred from the Court to the Board of Trade.

The tests of bankruptcy, or rather the acts done by a trader which make him liable to be proceeded against as a bankrupt, are technically called acts of bankruptcy. These are—departing the realm; remaining abroad; absenting himself from his

dwelling-house or keeping (himself prisoner in his) house, all with the intent of defeating or delaying his creditors; allowing his goods to be taken in execution for debt; executing a fraudulent grant, gift, or conveyance of his lands or goods; filing in court a declaration of inability to pay debt, or a simple notice that he suspends payment; or non-payment of a judgment debt after what is called a bankruptcy notice. If a trader execute a conveyance of his whole property to a trustee for the benefit of his creditors, this will be treated as an act of bankruptcy. And, after a petition has been presented, the paying or giving security to any one creditor, so that he shall receive more than the other creditors, is void and null.

The mode in which an adjudication in bankruptcy is conducted in England is as follows: The act of bankruptcy must have occurred within three months before the proceeding is commenced. The first step is a petition to the court. This may be presented by either one or several creditors. If, as is most usual, it is presented by a creditor or creditors, then such creditors must have a liquid, or duly constituted, claim of debt amounting to not less than £50 in the aggregate. If the debt is due under a mortgage or other security, the petitioning creditor must state his willingness to give up his security for the benefit of the creditors, or he must estimate its value, and the unsecured balance must amount to £50. If the petition be presented by the debtor himself, it cannot be withdrawn without leave of the court. The petition will not be entertained unless the debtor be domiciled in England, or within a year has ordinarily resided or had a dwelling-house or place of business in England; the interest of Scottish and Irish debtors being in this way protected. On the petition for adjudication of bankruptcy being presented, together with an affidavit of the debt, it is filed in court, and on proof of the particular act of bankruptcy, the court may appoint a special manager if the nature of the business requires it; otherwise the usual receiving order is pronounced, and the official receiver takes the estate until the creditors meet and determine, after the debtor's public examination and statement of affairs, whether he shall be adjudged bankrupt, or whether a scheme of arrangement or composition shall be entertained. Such a scheme must be accepted by three-fourths in value of the creditors, and will not be approved by the court unless it is reasonable and for the benefit of the general body of creditors. In the event of adjudication being resolved upon, the creditors appoint a trustee to receive and distribute the estate with the advice of a committee of inspection. The trustee gives security to the satisfaction of the Board of Trade. Even after adjudication, a composition may be accepted by special resolution, and the bankruptcy annulled. The bankrupt is bound to assist in every way in the discovery and realisation of his property, and he may be arrested if there is reason to believe that he is going to defeat these main purposes of the bankruptcy. The court may examine any one suspected of having the debtor's property, or being indebted to him, or being able to give information about the estate. They have also full discretion as to the discharge of the bankrupt, which may be absolute, or on conditions with respect to any earnings or income afterwards becoming due to the bankrupt, or after-acquired property. The discharge is not given if the bankrupt has committed any of the offences mentioned in the Act of 1883, or in the Debtors Act, 1869. The first class illustrate the severity of the new law; they are such as not keeping proper books within the three years before the bankruptcy; continuing to trade after knowledge of insolvency; contracting a debt without

any reasonable expectation of being able to pay it; bringing on bankruptcy by rash and hazardous speculations, or an extravagant manner of living; causing unnecessary expense by frivolous or vexatious defences to an action; having given, within three months before bankruptcy, an undue preference; having previously been adjudged bankrupt, &c. An undischarged bankrupt who obtains credit to the extent of £20 without mentioning his bankruptcy, may be punished for misdemeanour. Every bankrupt is disqualified for all public functions, not merely for sitting in parliament, but for election to town councils and other local boards, and for acting as a justice of the peace. The disqualification ceases if the bankruptcy is annulled, or when the bankrupt is discharged with a certificate that the bankruptcy was caused by misfortune without misconduct.

As regards the administration of the property by the trustee, the act lays down very precise rules in schedules, and the Lord Chancellor has power to make further rules. Every liability of the debtor is provable, except a demand for unliquidated damages not founded on contract or breach of trust. Where there have been mutual dealings between the debtor and a creditor, the latter proves only for the balance. A preference is given to taxes and rates, wages or salary of clerks and servants and workmen for four months up to £50, and by a statute in 1886, this preference is established in the case where an agricultural labourer has agreed to take his wages in a lump sum at the end of the year. If there is any surplus, it is first applied in payment of interest on debts. From the assets available for distribution, there is excepted property held by the bankrupt in trust, and his trade tools, and the necessary wearing apparel and bedding of himself and family, but not beyond the value of £20. Goods in the reputed ownership of the bankrupt, though belonging to another, are available for distribution; and also the pay or salary or pensions of public servants to a certain extent. On the other hand, the trustee is entitled to disclaim burdensome property or shares or contracts likely to result in loss. The trustee has full powers of sale and compromise. The first dividend should be paid within four months of the first meeting of creditors, and subsequent dividends at intervals of not more than six months. In general, the trustee is paid by commission, partly on the amount realised, and partly on the amount distributed. If one-fourth of the creditors dissent from this, the matter is adjusted by the Board of Trade. That Board also appoints the official receivers in each district, and they have opened in the Bank of England a bankruptcy estates account, into which bankruptcy money from every district in England must be paid. If the Committee of Inspection make out a special case, the Board of Trade will permit money to be paid into a local bank. The creditors have the power of removing the trustee by a simple vote.

The Bankruptcy Act, 1883, also contains important provisions as regards small bankruptcies, where the property of the debtor is not likely to exceed £300; in such cases, the official receiver becomes trustee, there is no Committee of Inspection, and the procedure is more summary. Also, where judgment has been obtained in a county court against a debtor unable to pay, but whose total indebtedness is less than £50, that court may administer his estate, and make an order for the payment of his debts by instalments. The act also provides for the administration in bankruptcy of the estate of a person dying insolvent, which formerly could be accomplished only by a suit in Chancery.

The criminal offences connected with bankruptcy

are defined by the Debtors Act, 1869, as modified by the Act of 1883, which gives all bankruptcy courts power to commit for the trial of such offences, and directs the public prosecutor to take proceedings. The most common offences are—the bankrupt's not surrendering himself to the jurisdiction of the court at the time appointed; not making a full discovery of all his property and his dealings with it; concealing or embezzling part of his property above £10; not informing his trustee of any false debt proved under his bankruptcy; falsifying his books; fraudulently accounting for his property by fictitious losses; pawning or *mala fide* disposing of property within three months before the bankruptcy; or any of the offences mentioned above as disentitling a bankrupt to discharge.

In Ireland, the code of Bankruptcy differs largely from that in England and Scotland. It consists of the Irish Bankrupt and Insolvent Act, 1857; the Debtors Act (Ireland), 1872; and the Bankruptcy (Ireland) Amendment Act, 1872. The first of these statutes contains 410 sections, and 26 schedules, which were largely modified in 1872. The general principle is that of adjudication in the Court of Bankruptcy at Dublin, the estate being taken by official assignees, who act along with an assignee afterwards appointed by the creditors. They are paid by a percentage on realisation. Prior to 1872 the law was open only to enumerated classes of traders. The procedure in insolvency at quarter sessions, provided for by the Act of 1857, has been discontinued, and now local courts in Ireland have no jurisdiction in bankruptcy, except under reference from the Central Court. Compositions may be sanctioned by three-fifths in number and value of the creditors, and under the trustee clauses of the Act of 1872, winding up by a trustee and committee of inspection was introduced. Imprisonment for debt was abolished in 1872, and new provisions introduced for the punishment of fraudulent debtors.

In Scotland, Bankruptcy, or Sequestration, now universally proceeds under the Bankruptcy (Scotland) Act, 1856, 19 and 20 Vict. chap. 79, which superseded previous general Acts of 1815 and 1839, and is substantially the same process as that which prevails in England; but there are some differences of no small importance, besides the different names given to the steps of the process. Certain acts and conduct of the bankrupt are held to be symptoms of notour bankruptcy, corresponding to what are called in England acts of bankruptcy. The first step is a petition for sequestration, which may be presented by the debtor or by creditors whose debt must be of the same amount as in England. There is no separate court of bankruptcy, but the sheriff of the county, or the Bill Chamber of the Court of Session, has jurisdiction to award sequestration, and the court then appoints a judicial factor, if necessary, until the creditors elect a trustee, in whom the property vests. The creditors also appoint commissioners to advise with the trustee as to the management of the estate. The duties of the trustee and commissioners are nearly identical with those of the trustee and committee of inspection in England. The creditors prove their debts in a similar way. There are also powers of winding up the estate under a deed of arrangement. The whole procedure in the sequestration has been very much imitated in the statute passed in England. The commissioners of the creditors fix the trustee's remuneration. The trustee examines the grounds of claim of creditors, there being an appeal to the Lord Ordinary or sheriff, and he examines the bankrupt and his family on oath, if necessary. On a report from the trustee as to the conduct of the bankrupt, which is not demandable by the bankrupt till five

months after the sequestration, the bankrupt petitions for his discharge, and when the creditors all concur, he is entitled to his discharge at once if he has paid 5s. in the £1; at later dates, if he has the concurrence of a certain number of his creditors, he is also entitled to a discharge; but if the creditors oppose, the court has a discretionary power to grant or suspend the discharge with or without conditions. But in no case will a discharge be given in a case where there has been fraudulent concealment of effects, or where less than 5s. in the £1 has been paid, unless it is proved that the failure to do so arose from circumstances for which the bankrupt is not responsible. In Scotland, there is no distinction, as there was once for many purposes in England, between traders and non-traders. Another peculiarity of a sequestration is, that the process is applicable not only in the case of debtors who are alive, but in cases of persons who have died in insolvent circumstances. In Scotland, there is a process called *cessio bonorum*, the application of which has been very much extended by the recent statutes of 1880 and 1881, abolishing imprisonment for debt, and giving creditors the right to institute proceedings; and where the debtor has trifling assets, it is in the power of the creditors to resolve that their debtor shall not have a discharge under the sequestration, but only a decree in a *Cessio Bonorum* (q.v.).

By the Bankruptcy Frauds and Disabilities Act, 1884, the law of Scotland was assimilated to that of England in certain important respects. The same disqualifications of bankrupts for parliamentary and municipal office are introduced; and it is declared an offence for an undischarged bankrupt to obtain credit for £20 or more.

With regard to the effect of a bankruptcy in either of the three kingdoms, the rule is, that whether the bankruptcy is awarded in England, Ireland, or Scotland, all the property of the bankrupt vests in the assignee or trustee, wherever it is situated; and when the bankrupt is discharged, the discharge is thereafter complete and given effect to in all parts of the United Kingdom. For some time after the passing of the Act of 1856, owing to the belief that it was much easier to be made a bankrupt, and obtain a discharge from debt, in Scotland than in England, various English debtors resorted to Scotland for forty days, in order that they might be made bankrupt, no doubt thinking that creditors would be less likely to oppose their discharge at that distance; and after their discharge, they returned to England, and pleaded this Scotch bankruptcy. But a recent statute has given power to the Scotch courts to recall such sequestrations, where, from the situation of the assets and the residence of the majority of the creditors, it appears that the distribution ought to take place in England or Ireland. By an Act of 1875, clerks, shopmen, and servants employed by a bankrupt have a preference for four months' wages, and workmen for two months' wages. There is in Scotland an Accountant in Bankruptcy, to whom trustees render accounts, and whose report is accepted by the court as conclusive on a variety of matters. The Accountant makes a general report to the Court of Session every year on all sequestrations, but this is not published or laid before parliament.

In the United States, the several states have power to legislate on the subject of bankrupt and insolvent laws, subject to the authority conferred upon congress by the constitution to adopt a uniform system of bankruptcy, which authority, when exercised, is paramount. Such state laws, discharging the person or property of the debtor, cannot constitutionally be made to apply to contracts entered into before they were passed; and

they apply only to contracts made within the state between citizens of that state. The power of congress in this matter has been exercised by a series of statutes, the latest of which is dated 1878, and which deals with the general doctrines of voluntary and involuntary bankruptcy, offences against bankrupt law, and the constitution of bankruptcy courts. It is unnecessary to describe the varieties of practical detail in the administration of the various states.

For England, see Robson, *On the Law of Bankruptcy* (6th ed. 1887); for Scotland, Bell's *Commentaries*, and Goudy, *On the Law of Bankruptcy in Scotland* (1886).

Banks, SIR JOSEPH, a zealous naturalist, was born in London, 13th February 1744, and was educated at Harrow, Eton, and Christ Church, Oxford. A student of botany from his fifteenth year, in 1766 he made a voyage to Newfoundland, collecting plants; and from 1768 to 1771 he accompanied Cook's expedition round the world in a vessel equipped at his own expense. In 1772 he visited the Hebrides and Iceland, whence he brought back a rich treasure of specimens for his studies in natural history. Before this voyage, Staffa was hardly known beyond its immediate vicinity. It was carefully examined by Banks, and through him its wonders were made known to the public. In 1778 he was elected President of the Royal Society, an office which he held for 41 years; in 1781 he was created a baronet, and in 1802 a member of the French Institute. He died at Spring Grove, Isleworth, 19th June 1820. Banks deserves particular credit for founding and managing the African Association; and the colony of Botany Bay owed its origin mainly to him. Through his efforts, the bread-fruit tree was transferred from Tahiti to the West Indies, and the mango from Bengal, as well as many of the fruits of Ceylon and Persia. Many naturalists and travellers—Blumenthal, Horne-mann, Burckhardt, Mungo Park, and others—were indebted to him for zealous and disinterested assistance. During the French war, Banks did much to alleviate the sufferings of all captive men of science; and Cuvier, in his *éloge* on him, states that no less than ten times had collections, captured by the English, been restored to France through Sir Joseph's instrumentality. Some articles excepted, Banks wrote nothing but *A Short Account of Blight, Mildew, and Rust* (1805), and *Circumstances relative to Merino Sheep* (1809). He left a valuable library, catalogued by his friend Dryander (5 vols. 1800-5), and a rich collection of specimens in natural history, both of which he bequeathed to the British Museum.

Banks, NATHANIEL PRENTISS, American politician and soldier, was born in Massachusetts, 30th January 1816. At first a factory-worker, he studied law, and became successively a member of the state and the national legislatures. He was Speaker of congress in 1856, and in 1857, 1859, and 1861 was elected governor of his native state. On the outbreak of the war, he took a command in the army, at first on the Potomac, then at New Orleans, and finally on the Red River. Relieved of his command in 1864, he re-entered congress, voting mainly with the Republican party.

Banks, THOMAS, sculptor, born in Lambeth in 1735, for seven years was apprenticed to an ornament carver, and in 1763 gained a medal for a bas-relief from the Society of Arts, in 1770 the gold medal of the Royal Academy. In 1772-79, having married a well-to-do wife, he resided in Rome. He gained much fame but little profit, and on his return to London, his refined imaginative style was little appreciated in comparison with the inferior performances of some of his contemporaries. In 1781 he repaired to Russia, where he was well received

by the Empress Catharine, who purchased his 'Cupid,' and gave him a commission for a group called 'Armed Neutrality.' Next year he returned to England, where, in 1784, he exhibited perhaps his finest work, 'Achilles Enraged,' now in the entrance hall at Burlington House. In 1785 he was elected a member of the Royal Academy. The monuments of Sir Eyre Coote in Westminster Abbey, and of Captains Burgess and Westcott in St Paul's Cathedral, were among his works. He died February 2, 1805. It was in purely imaginative works that Banks most excelled; in practical subjects, his introduction of the ideal was incongruous and inartistic.

Banks, in Navigation, are shelving elevations in the sea or the bed of a river, rising to or near the surface, composed of sand, mud, or gravel. When tolerably smooth at the top, they constitute *shallows*, *shoals*, and *flats*; but when rocky, they become *reefs*, *ridges*, *keys*, &c. A good chart always defines them, indicating whether they are sands or rocky. Some sandbanks shift their position by reason of currents, &c., and are specially troublesome.

Banks, SAVINGS. See SAVINGS-BANKS.

Banksia, a genus of the Australian order Proteaceæ (q.v.), named in honour of Sir Joseph Banks. Most of the species are shrubs, but a few become small trees. They have hard dry leaves, generally white or very pale green beneath, and present a remarkable appearance from the peculiar arrangement of their branches, which bear towards their extremities oblong heads of very numerous

Banksia :

A, shoot; B, single flower enlarged; C, in section.

flowers. The flowers secrete much honey. Some of the species are now frequent ornaments of green-houses in Britain. They are abundant in all parts of Australia, forming, indeed, a characteristic feature of its vegetation, and are called Honey-suckle trees. *B. grandis*, found at Swan River, exceeds all the rest of the genus in size, being said occasionally to attain a height of 50 feet.

Banks Land, an island in the west of Arctic America, discovered by Parry in 1819, explored by McClure in 1850, and named by him Baring Island. It is separated by Banks Strait from Melville Island, lying to the north-west, and by Prince of Wales Strait from Prince Albert Land, lying eastward.

Bank'ura, a town, capital of a district in Bengal, on the north bank of Dhalkisor River. It is a healthy place, with a trade in rice, oil-seeds, cotton, and silk. Pop. 17,000.—The district, in Bardwan division, Bengal, has an area of 2621

sq. m.; pop. (1881) 1,041,752, over 90 per cent. of whom are Hindus.

Bann, two rivers in the north-east of Ireland—the Upper Bann, flowing into, and the Lower Bann, out of Lough Neagh. The Upper Bann rises in the Mourne Mountains, and runs 25 miles NNW. through the counties of Down and Armagh. The Lower Bann, strictly the continuation of the Upper, issues from the north-west corner of Lough Neagh, and flows 40 miles NNW., through Lough Beg, dividing the counties of Antrim and Londonderry. It runs past Coleraine, into the Atlantic Ocean, 4 miles SW. of Portrush. It has important salmon and eel fisheries. Vessels of 200 tons can reach Coleraine by the river, 4 miles from the ocean.

Bannatyne Club, a literary club deriving its name from George Bannatyne (1545–1608), a native of Forfarshire, and Burgess of Edinburgh, to whose manuscript, compiled during the pestilence of 1568, we are indebted for the preservation of much of the Scottish poetry of the 15th and 16th centuries. The Bannatyne Club was instituted in Edinburgh in 1823 by Sir Walter Scott, with the assistance chiefly of David Laing of the Signet Library, Archibald Constable, and Thomas Thomson. Its object was to print rare works illustrative of Scottish history, topography, poetry, miscellaneous literature, &c., in a uniform and handsome manner, either at the expense of the club, or as the contributions of individual members. The club originally consisted of 31 members only, who paid an annual contribution of five guineas; but, owing to the anxiety of many eminent men to become members, the number was gradually extended to 100. Its first president was Sir Walter Scott, who was succeeded by Thomas Thomson, and Lords Cockburn and Rutherford; and its first secretary was David Laing, who continued to its close to discharge the duties of the office. The club had annual meetings in December, which seem to have been of a very convivial character. The club was dissolved in 1861. Since its commencement it numbered among its members many of the most distinguished Scotsmen, and printed 116 works, some valuable as they are rare, and all fetching high prices at sales. A complete set was sold in 1887 for £235.

Banner, a term sometimes loosely used to signify any military ensign or standard (see STANDARD), but in a more strict sense denoting a square flag charged with the coat of arms of the owner. The banner was borne by sovereigns, princes, barons, and bannerets, and served as the ensign both of the owner of it and of his retainers and followers. It differed from the pennon not only in being square and not pointed, but in bearing only the owner's arms, and not his badge or device; and therefore the pennon of a newly made Banneret (q.v.), though intended to represent a banner, was not exactly one. The royal standard of the United Kingdom, and the cavalry standards in use in the army, are in strictness banners. See FLAG, PENNON.

Banneret, a higher grade of knighthood conferred by the sovereign for some heroic act performed in the field, and so called because the pennon of the knight was then exchanged for the banner—a proceeding which was effected by the sovereign on the field of battle standing beneath his own royal standard displayed, and tearing off the points of the pennon so as to give it the requisite square shape of the banner. The Roll of Caerlaverock contains an enumeration of 87 bannerets, including the king himself, 11 earls, and the Bishop of Durham, as present in the campaign of Edward I. in Scotland in 1300. During the reign

of Elizabeth, the degree of banneret was allowed to die out in England; but it was revived in 1642, when Colonel John Smith, who recovered the royal standard at Edgehill, had that dignity conferred on him by Charles I. Sir John Smith was properly the last knight-banneret made in England; for, though George III. bestowed the title on Sir William Erskine in 1764, and on five naval officers in 1773, the proceeding was considered irregular, as the ceremony was performed at a review, and not in actual warfare; and the rank of the recipients of the honour was therefore not generally recognised.

As occupying a rank intermediate between barons and ordinary knights, bannerets have sometimes by an etymological misapprehension been styled 'baroneti' instead of 'bannereti.'

Bannock, a cake of home-made bread, common in Scotland and the north of England. It is usually composed of pease-meal or of pease and barley meal mixed; prepared without any leaven, it is baked on a circular plate of iron, called a girdle. When made of mixed meal, it is often called a *maslum bannock*. 'Bannocks of barley-meal' form the theme of a popular Scottish song. The word bannock is from the Gaelic *bannach*, 'a cake.'

Bannockburn, a Stirlingshire village of 2550 inhabitants, 3 miles SSE. of Stirling, on the Bannock Burn, a little affluent of the Forth. It is an important seat of the woollen manufactures, especially of carpets and tartans. Tanning is carried on to some extent, and the neighbouring villages are noted for the manufacture of nails; whilst coal abounds in the vicinity. In the great battle of Bannockburn, fought on Monday, 24th June 1314, Robert Bruce, with 30,000 Scotch, gained a signal victory over Edward II., with 100,000 English, and secured his throne and the independence of Scotland. The English are said to have lost 30,000, and the Scotch 8000 men. The 'Bore Stone,' on which Bruce is said to have fixed his standard on that eventful day, is still to be seen on an eminence; and near it is a flagstaff, 120 feet high, erected in 1870. Not far off was fought the battle of Sauchieburn (q.v.). See R. White's *Battle of Bannockburn* (Edin. 1871).

Banns, or BANS, OF MARRIAGE. This is one of three alternative preliminary forms now essential to the legal celebration of marriage in England, the other two being episcopal license and a registrar's certificate. Banns of marriage, like many of our ecclesiastical regulations, have their origin in the ancient practice of the Roman Catholic Church, which our reformers wisely refrained from abolishing. By the publication of these banns is meant the legal proclamation or notification within the parish, district, or chapelry, and in the proper church or chapel, of the names and descriptions of the persons who intend to be there married; the object being that all who have objections to the marriage may be enabled to state them in time. If the bridegroom live in a different parish from the bride, the banns must be proclaimed also in that parish, and a certificate of such proclamation must be produced before the celebration of the marriage. According to the old English canon law, the publication of banns might be made on *holidays*; but a change was made to *Sundays* by Lord Hardwicke's Marriage Act in 1753, and although that act was afterwards superseded by the 4 Geo. IV. chap. 76, the regulation as to *Sundays* has been since continued. Seven days' notice at least must be given to the clergyman before publication of banns. Banns are to be published in an audible manner, according to the rubric prefixed to the marriage-service in the *Book of Common Prayer*, upon three *Sundays* preceding the ceremony, during the time of morning-service, or of evening-service (if on the day of

publication there shall be no morning-service) immediately after the second lesson. Marriages celebrated without publication of banns, or license, or a registrar's certificate, are null and void. By the Marriage Act of 1836, the bishop may license chapels for the celebration of marriages in populous places; and by 1 Vict. chap. 22, banns may be published in such chapels. If the marriage be not celebrated within three months after publication of banns, the marriage shall not take place until the banns shall have been republished on three several *Sundays*, unless it be a marriage by license, or now, by certificate, which two latter alternatives, however, must also be availed of within the three months.

The purpose of the law is to secure public knowledge of intended marriages, and therefore it is not necessary that such publication should be made in the real baptismal names of both or either of the parties; it is sufficient that the banns be published in the names by which the parties are *known*, or either of them. But if either of the names used be false, to the knowledge of *both* parties, the marriage is void. As the publication of banns invites people to object, if the parent or guardian express dissent, it is the duty of the clergyman, when such objections are offered, to proceed no further; and if he marry a minor, notwithstanding such dissent, he will be liable to severe penalties by the ecclesiastical law, though he will not be liable to an indictment. Again, on the other hand, if a clergyman of the Church of England refuse, without cause, to perform the marriage, he is liable to an action.

In Scotland, Fraser shows that banns were first sanctioned by councils which were held in that country long before the time of the Council of Trent. After the Reformation in Scotland, the practice of proclaiming banns was continued. In 1712 the privilege of publicly celebrating marriage was extended to the Scotch *Episcopalian* clergy, and in 1834 to those of other dissenting bodies. When both of the parties have their *Domicile* (q.v.) within Scotland, and enter into marriage in England or Ireland, they must have their banns proclaimed in the parish of their domicile in Scotland, otherwise they are liable to the penalties of clandestine marriage. By the Marriage Notice Act, 1878, a certificate of publication of notice of marriage may be issued by a registrar to persons resident for fifteen days in the district; the fee for registry is 1s. 6d.

The Scotch law differs from the English in regard to the effect of non-publication of banns. In England, in some cases, the consequence is to render the marriage absolutely void. In Scotland, however, marriage, without proclamation of banns, is valid; but in such case the parties, celebrator, and witnesses, are liable in special penalties. See MARRIAGE; SPECIAL LICENSE; REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

In the United States, banns of marriage are not required in most states, having been gradually superseded by the marriage license; in some states even this is not required. Each state has entire jurisdiction over its own citizens on the subject of marriage.

Banquette, in Fortification, is a raised ledge or step inside the parapet of a rampart, of such a height that musketeers, when standing on it, may be able to fire over the crest of the parapet without too much exposure to the enemy.

Banshee, in the folklore of the Irish and Western Highlanders of Scotland, a female fairy who makes herself known by wailings and shrieks, before a death in the family over which she exercises a kind of guardianship. This notion is woven

into many folk-tales of rare pathos and beauty. A guardian spirit of the same kind occurs frequently in the folklore of Brittany. The name is supposed to be a phonetic spelling of the Irish *bean sídhe*, old Irish *ben síde*, 'woman of the fairies.'

Banswara, a state in the south-west of Rajputana. The surface is hilly, with much timber; it has an area of 1500 sq. m., and is peopled by wild and turbulent Bheels. This state was fearfully oppressed by the Mahrattas, till, in 1818, it passed voluntarily into British protection. Pop. (1881) 104,000.—The capital, also called Banswara, lies 8 miles W. of the Mahi River. Pop. about 6000.

Bantam, a seaport, now decayed, about 61 miles W. of Batavia, in a residency of the same name, which forms the west end of Java. It occupies an unhealthy situation, on a low swampy beach. It was the first Dutch establishment in Java (1595), and the seat of government of the residency, until transferred to the more salubrious Serang, 6 miles distant, in 1816. The harbour is now much obstructed by coral-reefs and other deposits, and the trade has gone to Batavia. Pop. of residency, 760,000.

Ban'tam Fowl (*Gallus bankiva*), a well-known variety of the common Domestic Fowl, originally brought from the East Indies, and supposed to derive its name from Bantam, in Java, though they probably came from Japan. It is remarkable for small size, being only about a pound in weight, and for a disposition more courageous and pugnacious than even that of a game-cock. A bantam-cock will drive to a respectful distance great dung-hill-cocks five times its weight, and has been described as 'a beautiful example of a great soul in a little body.' There are several sub-varieties of the bantam. Most of them have the legs much feathered. The flesh and eggs are good, although the eggs are of course small. The bantam hen lays well in winter. See POULTRY.

Banteng (*Bos sondaicus*), a species of ox, a native of Java and Borneo, which, in colour, shape, horns, and absence of dewlap, bears some resemblance to the Gaur (q.v.) (*Bos gaurus*) of India. The banteng is black, with white legs; the hair is short and sleek; the limbs slender; the muzzle sharp; the back rises into a high arch immediately behind the neck. It inhabits forests, and has been generally described as untamable.

Banting System. See OBESITY.

Bantry, a seaport town in the south-west of County Cork, Ireland, in a cove opposite Whiddy Isle, at the head of Bantry Bay, and 44 miles WSW. of Cork. The chief trade is the export of agricultural produce. A little fishing is carried on. In last century there was an extensive pilchard-fishery here; but the pilchard has now deserted the coast. Many tourists resort to Bantry in summer. Pop. (1871) 2830; (1881) 2632.

Bantry Bay, a deep inlet in the south-western extremity of Ireland, in County Cork. It is 25 miles long, running ENE., with a breadth of 4 to 6 miles. It is one of the finest harbours in Europe, affording safe and commodious anchorage for ships of all sizes. Here a French force attempted to land in 1796. The coast around is rocky and high.

Bantu ('people'), a native word applied by Friedrich Müller as an ethnographical name to a large group of African languages, and to the peoples speaking the same. The Bantu races occupy most of Africa from 20° S. lat. to 6° N. lat. northwards, and are broadly distinguished from the Negritos and Hottentots to the south, and the Soudanese negroes to the north. They fall geographically into three divisions. The eastern includes Kaffirs and Zulus,

and extends to the Galla and Somali country, the Swahili being the most northerly section. The central division comprises Bechuans (Basutos, Barolong, &c.). To the western division belong the inhabitants of the west coast from the Hottentot country to the Gulf of Guinea, the peoples of Benguela, Angola, Congo, Loango. The linguistic inter-relationship of the Bantu languages, as intimate as that of the Indo-Germanic family, was first recognised by Gabelentz and Pott, and afterwards elaborated by Bleek. It rests both on roots and on grammar. Within their range are included by Lepsius all the negro languages of Central Africa. See AFRICA, KAFFIRS, ZULUS, &c.

Banville, THÉODORE DE, a French poet and prose-writer, the son of an officer in the French navy, was born at Moulins in 1820. His first volume, *Les Caryatides*, issued in 1841, gave him a standing as a poet among the younger members of the Romantic school, and was followed by *Les Stalactites*, *Rimes Dorées*, *Trente-six Ballades Joyeuses*, *Les Exilés*, *Les Occidentales*, *Odes Funambulesques*, *Comédies*, *Esquisses Parisiennes*, *Contes pour les Femmes*, *Contes Féeriques*, *Mes Souvenirs*, *Petit Traité de Poésie Française*, and *Dans la Fournaise* (1892). He was one of the most musical and sparkling of lyrists; one of the gayest and wittiest of parodists. The title 'roi des rimes' was given him from the graceful ingenuity with which he handled the most difficult forms of verse—the ballades, rondeaux, and rondels of the mediæval writers—which he restored to popularity in France, and which Andrew Lang and Austin Dobson, following his example, have successfully introduced into English poetry. Banville was an eloquent but hardly a discriminating critic. He died 12th March 1891.

Banyan, or **BANIAN** (*Ficus indica*), an Indian tree, remarkable for its vast rooting branches. It is a species of Fig (q.v.); has ovate, heart-shaped entire leaves, about 5 or 6 inches long; and produces a fig of a rich scarlet colour, not larger than a cherry, growing in pairs from the axils of the leaves. The branches develop pendulous adventitious roots, which soon become new stems, the tree in this manner spreading over a great surface,

Banyan Tree.

in fact almost developing into a wood, and enduring for many ages, although the original central trunk decays. One has been described as having no fewer than 350 stems equal to large oaks, and more than 3000 smaller ones, covering a space sufficient to contain 7000 persons. The tree is inhabited by great numbers of birds, fruit-bats, and monkeys, which latter consume the leaves as well as the fruit. The seeds are often deposited by birds in the crowns of palms, and send down roots which become stems

and eventually replace the palm altogether. The wood of the banyan is light, porous, and of no value; but the tree furnishes lac and caoutchouc, and the bark and milky juice are sometimes employed in Hindu native medicine. By the Brahmins the banyan is held in special reverence, as is its congener the Sacred Fig, also called Peepul and Bo-tree (*F. religiosa*) by the Buddhists, so that it is said that the sites of temples can be readily distinguished as Brahmin or Buddhist by the presence of one or other tree.

Banyuls-sur-Mer, a town of France in the Pyrénées Orientales, with a fishing-port on the Mediterranean, close to the Spanish frontier, 21 miles SE. of Perpignan by rail. The bathing brings many visitors in summer. Pop. 2277.

Banyumas, a town of Java. It is situated at the opening of an extensive and fruitful valley on the left bank of the Serajo, 22 miles from the south coast. Pop. 9000. It is well built, and carries on a considerable trade, is the residence of a Dutch governor, and has a fort and garrison. It is the capital of a province of the same name, which produces coffee, sugar, indigo, rice, tobacco, &c. The area of the province is 2136 sq. m.; pop. (1883) 1,046,405, of whom only 583 were Europeans. The district is low and marshy towards the coast, but very mountainous in the north and east. The volcanic plateau of Dieng (6700 feet) contains the terrible 'valley of death,' a ravine full of volcanic gases, principally carbonic acid.

Banyuwangi, a prosperous seaport town and military post belonging to the Dutch, on the east coast of Java, capital of a district of the same name, and an important station of the telegraph connecting Europe and Australia. Pop. about 10,000.

Banz, once one of the richest and most famous of the Benedictine monasteries, on the right bank of the Maine, 3 miles below Lichtenfels. Founded in 1071, and destroyed in the Peasants' War in 1525, it was rebuilt, and although plundered again in the Thirty Years' War, it gradually became famed for the scientific attainments of its monks. In 1803 it was broken up, and its library and collections divided between the Munich museum and other institutions.

Baobab (*Adansonia digitata*), a magnificent tree belonging to the natural order Sterculiaceæ

Baobab Tree.

(q.v.), also called the Monkey-bread Tree, is a native of tropical Western Africa, but now introduced into the East and West Indies. It is one of

the very largest trees—not rising to a great height, but exceeding almost all other trees in the thickness of its trunk (20–30 feet). Even its branches (60–70 feet long) are often as thick as the stems of large trees, and they form a hemispherical head of 120–150 feet in diameter; their outermost boughs drooping to the ground, with large horse-chestnut-like leaves, and huge white solitary drooping flowers. The fruit (Monkey-bread) is of the size of a citron. The pounded leaves are mixed with the daily food of the inhabitants of tropical Africa; and Europeans in that country employ them as a remedy for diarrhoea, fevers, and diseases of the urinary organs. The pulp of the fruit is pleasant and slightly acid; and the expressed juice mixed with sugar is much esteemed as a refreshing and cooling beverage, specially grateful in fevers. The bark is said to be powerfully febrifugal, and yields a very strong fibre, but the wood is soft and readily attacked by fungi.

Bapaume, a French town, department of Pas-de-Calais, 12 miles S. of Arras. Here, on the 2d and 3d January 1871, took place two bloody struggles between the French army of the north and the Prussian 'army of observation;' the French were defeated, with a loss of over 2000. Pop. 3190.

Baphomet, the alleged name of a mysterious idol which the Templars were accused of worshipping. According to the oldest and most common interpretation, the word is a corruption of Mahomet, to whose faith the members of the order were accused of having a leaning. The symbol consisted of a small human figure, having two heads, male and female, and environed with serpents, the sun, and moon. Hammer, with little probability, explains the word as formed from Gr. *baphe* ('baptism') and *metis* ('wisdom'), the Gnostic baptism—a species of spiritual illumination, which was interpreted sensually by later Gnostics, to whose licentious practices he declares them to have been addicted. According to L'Abbé Constant's *Dogme et Rituel de la haute Magie*, quoted by Littré, the word was cabalistically formed by writing backwards *tem. o. h. p. ab.*, abbreviation of *templi omnium hominum pacis abbas*, 'abbot (father) of the temple of peace of all men.'

Baptism (Gr. *baptismos*, from *baptizo*, frequentative of *bapto*, 'I dip or dye'), one of the Sacraments (q.v.) of the Christian church, deriving its name from the rite of washing with water, which forms an essential part of it. Baptism is almost universally acknowledged among Christians as a sacrament, and is referred to the authority of Christ himself, whose express command to administer it is recorded in the gospels (Matt. xxviii. 19; Mark, xvi. 16).

The name and the rite were not altogether new, however, when the ordinance was instituted by Christ. Religious meanings were early attached to washings with water, both by heathens and Jews; they were among the ordinances of the Jewish law; and it is not necessary to go beyond that law to find the origin of the custom of washing or baptising proselytes upon their admission into the Jewish church. Washing with water was requisite for the removal of ceremonial uncleanness, and every proselyte must have been regarded as ceremonially unclean prior to his admission into the Jewish church. John the Baptist baptised not proselytes upon their renouncing heathenism and entering the Jewish church, but those who, by birth and descent, were members of it, to indicate the necessity of a purification of the soul from sin—a spiritual, and not a mere outward change.

One of the most important of the controversies which have agitated the Christian church as to

baptism, is that concerning the proper subjects of baptism: whether adults only who profess faith in Christ are to be baptised, or if this ordinance is to be administered to their infants also. The baptism of adults was certainly more frequent in the apostolic age than it has ordinarily been since, for which an obvious cause presents itself in the fact that the first members of churches were converts from Judaism or from heathenism. It is generally held, however, by those who advocate the baptism of infants, that it was the practice of the apostles and of the church of the apostolic age to baptise the infants of Christians (cf. Acts, xvi. 15, 33; 1 Cor. i. 16). This again is as stoutly denied by others, who allege that infant baptism crept in along with other corruptions. For neither opinion can any positive historical proof be adduced, the arguments on both sides being mainly inferential.

The chief arguments in favour of infant baptism are based upon the proposition that the church is one throughout all changes of dispensation. From this it is argued that as infants were, so they still must be included, in the visible church. It is maintained that in all covenants which God has made with men, their children have been included; that the covenant with Abraham was a renewed revelation of the covenant of grace, the temporal promises made to him being connected with the greatest spiritual promises; that circumcision was a seal of the covenant with respect to these, in which the children of Christians have the same interest that Jewish children had; and that baptism is a seal of the covenant now as circumcision was, the things to which it has immediate reference being also blessings which children are capable of receiving. It is contended that the arguments in favour of infant salvation derive additional strength from that view of the place of infants in the church according to which they are entitled to baptism. The passages which connect baptism with faith are regarded as exclusively relating to adults, like the passages which connect salvation with faith and repentance. In reply to the argument that there is no express command for infant baptism, it is argued that the state of the case rather demands of those who oppose it the production of an express command against it, without which the general command must be held to include it; the words and actions of our Saviour (Mark, x. 14) with respect to children are quoted as confirming the opinion that the place of infants in the church is precisely what it was under the Jewish dispensation; and it is contended that it would have been a very great restriction of privilege in the new dispensation if infants had been excluded from a place which they held before, as entitled to a seal of the covenant, whereas it is evident that the new dispensation is characterised not by restriction but by enlargement of privilege (Acts, ii. 39). For the arguments on the other side, see BAPTISTS.

It is admitted, on all hands, that at an early period in the history of the church, baptism was administered to infants, although, even after it had been set forth as an apostolic institution, its introduction into the general practice of the church was slow. The earliest direct evidence claimed for the practice is a passage from Irenæus, who flourished in the 2d century. Tertullian, who came a little later, looked with disfavour on infant baptism; but it was regarded by Origen (circa 185-254) as an apostolic institution. As such it was acknowledged in the North African church and in the Alexandrian and Syro-Persian churches in the 3d century; though it was not until the 5th century that it became fully established as the general practice of the Christian church. This it has unquestionably continued to be from that period to the present day; feebly opposed by some of the

sects of the middle ages, and more vigorously by some Protestants. See BAPTISTS.

Both the practice and the neglect of infant baptism in the early ages of the church were connected with particular views of religious doctrine, and of the nature and purpose of baptism itself. The prevalence of the Augustinian doctrine of Original Sin is generally regarded as a principal cause of the prevalence of infant baptism; whilst Pelagius, although opposing that doctrine, maintained the necessity of infant baptism. No little influence must be ascribed to the growing belief in the absolute necessity of baptism to salvation, and in a sort of mysterious efficacy in the rite itself. It is certain, on the other hand, that the belief in the forgiveness of sins in baptism led to a practice of deferring it as long as possible, in order that all sins might be blotted out at once. Thus the Emperor Constantine the Great was baptised only a short time before his death. The approach of a war or pestilence caused many to rush forward in haste to be baptised, who had previously delayed.

The Anglican and Lutheran churches, like the Roman Catholic, regard the baptism of infants as admitting them into the church, and making them members of Christ's body. Other Reformed churches hold that the children of Christians are included in the visible church from their birth, and therefore entitled to baptism.

Two modes of baptism are practised: by immersion or dipping, and by aspersion or sprinkling, concerning which there has been much controversy in the early period of the church's history, as well as in recent times. Affusion or pouring, the common practice of the Church of Rome, may be regarded as essentially one with sprinkling. The advocates of sprinkling universally admit the validity of baptism administered in the other mode, but the advocates of dipping generally refuse to acknowledge that baptism by sprinkling can be true Christian baptism. The opponents of infant baptism, almost without exception, insist upon immersion; whilst aspersion or affusion of water is general, except in the Eastern churches, wherever the baptism of infants prevails. The argument upon which Baptists depend most of all is that from the word baptism and the verb *baptizo*, which, in classic Greek, signifies to immerse. On the other side, it is contended that a strict limitation to this sense does not well accord with its character as a 'frequentative' form of *bapto*; and instances are adduced from the New Testament itself in which this signification cannot easily be attached either to the noun or to the verb, as 1 Cor. x. 2, where Paul says that the Israelites were 'baptised unto Moses in the cloud and in the sea'; and Heb. ix. 10, Mark, vii. 4, and Luke, xi. 38, where both verb and noun are employed concerning the washings of the Jews, and the noun, even of their washing of 'cups, and pots, brazen vessels, and of tables.'—To the argument in favour of immersion derived from the phrases employed when baptism is mentioned in Scripture—as when we are told that John the Baptist baptised 'in Jordan' (Matt. iii. 6), that our Lord after his baptism 'went up out of the water' (Matt. iii. 16), that Philip and the Ethiopian eunuch 'went down both into the water' (Acts, viii. 38)—it is replied that all the passages of this description, even if their meaning were certainly as precise and full as Baptists suppose it to be, are insufficient to sustain the weight of the conclusion as to the necessity of a particular mode of baptism; that, on the contrary, it is far from being clear that these passages must be interpreted, or the meaning of the Greek prepositions so strictly defined, as the argument requires; and further, that there are instances mentioned in Scripture which afford a presumptive argument in favour of

another mode of baptism, as when we are told of great numbers being added to the church in one day, whilst there is no intimation of the converts being led to any pool or river to be baptised. To the argument drawn from the language of Paul in Rom. vi. 4, Col. ii. 12 (see BAPTISTS), it is replied that it depends upon a fanciful interpretation of these texts. According to the advocates of baptism by sprinkling, their opponents commit the great error of attaching too much importance to the question of the mode of baptism.

It is, however, indisputable that at a very early period the ordinary mode of baptism was by immersion, in order whereto Baptisteries (q.v.) began to be erected in the 3d, perhaps in the 2d century, and the sexes were usually baptised apart. But baptism was administered to sick persons by sprinkling; although doubts as to the complete efficacy of this *clinical* baptism were evidently prevalent in the time of Cyprian (middle of 3d century). Baptism by sprinkling gradually became more prevalent; and a dispute concerning the mode of baptism became one of the irreconcilable differences between the Eastern and Western churches, the former generally adhering to the practice of immersion, whilst the latter adopted mere pouring of water on the head, or sprinkling on the face. This practice, although generally adopted in the West from the 13th century, was not universal, for it was the ordinary practice in England before the Reformation to immerse infants, and the *Fontes* (q.v.) in the churches were made large enough for this purpose. It continued to be the practice even till the reign of Elizabeth; and the change which then took place is ascribed to the English divines who had sought refuge in Geneva and other places on the Continent during the reign of Mary. To this day the rubric of the Church of England requires that, if the godfathers and godmothers 'shall certify him that the child may well endure it,' the officiating priest 'shall dip it in the water discreetly and warily;' and it is only 'if they certify that the child is weak,' that 'it shall suffice to pour water upon it;' although the latter, or sprinkling, is now the ordinary practice.

Besides the simple rite of washing with water, and the pronouncing of the formula which declares it to be 'in the name of the Father, and of the Son, and of the Holy Ghost,' baptism was accompanied, from an early period in the history of the church, with various forms and ceremonies. These ceremonies are almost all retained in the Church of Rome, and also generally in the oriental churches, but have been almost entirely laid aside by Protestants. The Church of England retains the sign of the cross made upon the forehead after baptism, but the other Protestant churches in Britain reject it. It was an ancient custom that the *catechumens*, as candidates for baptism were called while receiving instruction with a view to that sacrament, when they were to be baptised, publicly made a profession of their faith and a renunciation of the devil and all his works. The profession of faith is still retained by Protestant churches as the formal ground of the administration of baptism; the renunciation of the devil and his works is required by the Church of England of the person baptised, if an adult, or of the *sponsors* or 'sureties' of a child.—Sponsors (q.v.) were early admitted to answer for those who could not answer for themselves, and particularly for infants. The belief in the absolute necessity of baptism to salvation led even to baptism of the dead among the Montanists in Africa, in which sponsorship was also introduced. Presbyterian and Independent churches generally reject all sponsorship, and regard the profession made by parents as simply a profession of their own faith, which entitles their infants to baptism. The ancient

practice of Exorcism (q.v.) immediately before baptism, has been rejected as superstitious by almost all Protestant churches; as have also that of immersing three times (*trine immersion*), or sprinkling three times, with reference to the three Persons of the Godhead—that of breathing upon the baptised person, 'to signify the expulsion of the devil,' and to symbolise the gift of the Holy Spirit—that of anointing with oil (*Chrism*, q.v.), to symbolise the same gift, or to indicate that the baptised person is ready, like a wrestler in the ancient games, to fight the good fight of faith—that of giving him milk and honey, in token of his spiritual youth, and of his reception of spiritual gifts and graces—that of putting a little salt into his mouth, to signify the wisdom and taste for heavenly things proper to a Christian—that of touching his nostrils and ears with spittle, to signify that his ears are to be ever open to truth, and that he should ever feel the sweet odour of truth and virtue—and that of clothing him after baptism with a white robe (the *chrysosme*), in token of the innocence of soul which by baptism he was supposed to have acquired. The white robe and the anointing with oil were retained in the Church of England for a short time after the Reformation.—The giving of a name in baptism (see the article NAMES) is no essential part of it, but is a custom apparently derived from that of the Jews in circumcision (Luke, i. 59-63).—The Church of Rome prefers the use of Holy-water (q.v.) in baptism, but regards any water as fit for the purpose in case of necessity.—According to an ancient usage long obsolete, the ordinary administration of the rite (solemn baptism) was limited to the two great festivals of Easter and Whitsuntide.—Whether baptism may be administered in private has been much debated, both in ancient and modern times. The administration of baptism in private houses, and not in the presence of a congregation, was one of the things earnestly contended against by the Presbyterians in Scotland in the first half of the 17th century; their opposition being grounded, not only upon hostility to what they deemed usurpation of authority, but upon the danger of superstitious views of baptism. And apparently upon this latter ground, baptism in private houses is also discouraged by the Church of England, even while it is allowed if there is 'great cause and necessity.' Yet it has become very frequent among the Presbyterians of Scotland.

Some of the most important questions concerning baptism will be most appropriately noticed in the article SACRAMENT, particularly those relating to its place in the Christian system and among the means of grace. The opinions early became prevalent that forgiveness of sins is obtained and spiritual life begun in baptism, and that it is indispensably necessary to salvation—the only exception made, if any was made at all, being in the case of adult believers, who, desiring baptism, were prevented from receiving the rite, and particularly of those who suffered martyrdom, which was generally held to be equivalent to baptism. The Church of Rome still owns, as supplying the place of baptism by water, these two—baptism by desire, and baptism by blood, i.e. martyrdom.—According to the general doctrine of the Protestant churches, baptism is 'a sign and seal' of the covenant of grace, representing as a sign the blessings of the covenant, and as a seal, confirming the covenant. As a sign, it is generally held to represent in its rite of washing, the removal both of guilt and corruption, by the blood and by the Spirit of Christ, and so to relate equally to pardon and regeneration, although some have limited its symbolic reference to regeneration alone. One of the most important points disputed concerning baptism, is that of baptismal regeneration (see REGENERATION).

Some early Christian sects appear to have rejected baptism, on grounds somewhat similar to those on which it is rejected by Quakers (q.v.) at the present day, who explain the passages relating to it symbolically, and insist that a spiritual baptism is the only real baptism of Christians.

There has been much controversy concerning *Lay Baptism*. Wherever there is a recognised ministry in the church, there is a general agreement in confining the ordinary administration of baptism to those who hold this office. It might be expected that the more strongly the necessity of the transmission of *holy orders* by apostolical succession is asserted, the more strongly also would exclusiveness be manifested with regard to the right of the *clergy* to administer baptism. But this tendency is counteracted by the belief in the necessity of baptism, or at least of its great importance to the salvation of infants; so that from an early period lay baptism was allowed, although not without opposition, in cases of apprehended danger; and in the Church of Rome this principle is logically carried out to the fullest extent, so that even women are authorised to administer baptism in cases of necessity. On the same ground, lay baptism was at first permitted in the Protestant Church of England; but the prevalence of other views led to a formal restriction of the right of administering it to 'lawful ministers,' although in practice the validity of lay baptism is still generally recognised.

Another question much agitated in the church from early times was that concerning the validity of baptism by heretics. The opinion ultimately prevailed, that baptism by heretics is valid, except in the case of those who do not baptise in the name of the three Persons of the Godhead. This continues to be the almost universal opinion. The Church of Rome, however, employs a form of 'conditional baptism' in admitting a Protestant convert to its communion.

The *baptism of bells, ships, &c.* is a custom supposed to have been introduced about the 10th century, and still retained in the Church of Rome. The term *benediction* is sometimes substituted for that of baptism, but the rite itself is very similar to that of baptism, and is accompanied with many similar ceremonies—'a sort of exorcism,' sprinkling with holy-water, anointing 'with the oil of catechumens' and 'with chrism,' a formula of consecration 'in the name of the Father, Son, and Holy Ghost,' and sometimes also, if not always, the giving of a name to the bell consecrated, and even a kind of sponsorship as by godfathers and godmothers in baptism.

Bingham's *Ecclesiastical Antiquities*; Godwin, *Christian Baptism* (1845); Ingham (Baptist), *A Handbook of Christian Baptism* (1865); *Christian Baptism: its Subjects* (1871); Hall, *Infant Baptism*; Hodges, *Baptism tested by Scripture and History* (1875); Pusey, *Tracts for the Times*, No. 67; and the article in Dean Stanley's *Christian Institutions* (1882).

Baptistery (Gr. *baptistērion*, 'a large vase or basin'), the name given sometimes to a separate building, sometimes to the portion of the church in which the ceremony of baptism is performed. In the latter case, the baptistery is merely the inclosure containing the font, to be seen in most English churches. According to the earlier arrangements of the Christian church, however, the baptistery seems usually to have been a building standing detached from, though in the immediate vicinity of the church to which it appertained. It was the ceremonial building of the church, in which large numbers of converts were initiated at one time by immersion in the large font in the centre of the floor. In later times, these early baptisteries were frequently converted into churches, as in the case of Asti. At Novara, a very interesting

baptistery still exists in connection with the open cloister or atrium, to which alone the neophytes

Section and Plan of Baptistery at Asti.

were admitted before baptism. Baptisteries, at first, were either hexagonal or octagonal, but afterwards became polygonal, and even circular.

The celebrated baptistery of Florence is an octagonal structure, measuring about 100 feet in diameter. It stands detached from, but in the immediate vicinity of the west end of the cathedral. It is built of black and white marble, in the style which Giotto is said to have introduced, and which is still peculiar to Tuscany. The magnificent bronze doors, with their beautiful bas-reliefs, are remarkable features of this famous baptistery. The most celebrated of the three doors was executed by Lorenzo Ghiberti, the earliest being the work of Andrea of Pisa. Fifty years were required for their completion; and it is remarkable that the contracts for their execution are still preserved. Next in importance, and of even greater size, is the baptistery of Pisa. It is circular in form, the diameter measuring 116 feet. The largest baptistery ever erected is supposed to have been that of St Sophia, at Constantinople, which was so spacious as to have served on one occasion for the residence of the Emperor Basilicus.

Detached baptisteries were common in the days of the early church, when adult baptism was practised; but on the introduction of infant baptism, buildings of this size were no longer needed, and the baptistery was absorbed into the church (see APSE). Numerous examples of circular baptisteries on the model of the Italian ones are still to be found in the south of France.

Baptists, a body of Christians sometimes called *Antipædobaptists*, as opposed to *Pædobaptists*, or those who advocate Infant Baptism. They reject the name of Anabaptists, as expressing what, from their point of view, is not their practice—viz. the rebaptising of converts from Pædobaptist communions—for they regard the baptism of professed believers alone as valid—and also as associating them with the scandals of the German Anabaptists (q.v.) of the 16th century, from whom they claim to be historically distinct. Baptists refuse to acknowledge any great name as founder of their sect. They trace their origin to the primitive church itself, and refer to the Acts of the Apostles and the Epistles as affording, in their opinion, incontestable evidence that their leading tenets have the sanction of inspiration. When Christianity became corrupted, their scriptural practice was, they hold, maintained among the Cathari and Albigenses and other sects of the middle ages. They sprung into notice in England under Henry VIII. and Elizabeth. They were persecuted under both reigns, but, with other Nonconformists, they received freedom to meet for worship from James II., and complete religious liberty under William III. Ever since, they have been diffusing their principles extensively in Great Britain and North America.

The Baptists hold the plenary inspiration and supreme authority of the Holy Scriptures as a revelation from God; the equal deity of the Son and the Holy Spirit in the unity of the ever

blessed Trinity. But they have amongst them many shades of belief. They have among them Calvinists both *hyper* and moderate, also high and low Arminians. The great body of them in Britain and America hold the doctrine of Calvinism in a modified form—that is to say, they maintain the *sufficiency* of the Atonement for *all men*; the limitation which some have maintained, lies, they consider, in its *application* to the sinner by the sovereign grace of God through faith. At the present day, however—especially in Britain—the tendency of thought is towards the recognition of no other limitation than that which results from the exercise of man's free-will. They maintain the necessity of regeneration and holiness of life as essential to true religion, and that 'without holiness no man shall see the Lord.'

Particular Baptists, so called because holding that Christ died for an elect number, and *General Baptists* (called in America *Free-will Baptists*), who maintain that he died for all men, constitute the two leading sects into which the body is divided. *English Baptists*, in their church order and government, are the same as Congregationalists, the rite of baptism excepted. *Scotch Baptists*, properly so called, insist on a plurality of pastors in every church, and the exercise of mutual exhortation by the members in their public assemblies. There are Baptist churches in England that are *Scotch* in their order, but both in England and in Scotland they are, at the present day, few in number. All the churches in the Baptist Unions of England and Scotland are *English* in their order. There are, besides these great divisions, various small associations of Baptists scattered over Great Britain, America, and the Continent of Europe, whose opinions cannot be gathered up into systematic arrangement. In America, the following communions baptise by immersion, and decline to administer the rite to infants: The *Seventh-day Baptists*, who observe, not the first day of the week, but the seventh, as the day of rest; the *Six Principle Baptists*, so called from the circumstance that their creed is summed up in the six points named in Heb. vi. 1, 2; the *Christian Connection Baptists*, who are Unitarians; the *Disciples* or *Campbellites*, who are understood to teach the dogma of baptismal regeneration; the *Brethren* or *Tunkers* (q.v.), and the *Anti-mission*, or, as they are often called, *Hard-shell Baptists*, who object to all missionary societies and other organised schemes of benevolence, as not having, in their view, the sanction of Scripture. They decline to hold fellowship with those who seek by such means to further the cause of truth and righteousness. Their numbers are falling off from year to year. Some of these are represented in Britain, but their following is very small.

The particular tenet which characterises Baptists among their fellow-Christians is, that baptism is an ordinance the validity of which depends on an intelligent faith on the part of the recipient. Their views on the matter of baptism may be reduced to two heads—the *subjects* and *mode* of baptism. The subjects of the baptismal rite they hold to be believers in the Lord Jesus Christ. They ground their faith in this matter on the following positions—namely: 1st, The Lord in his commission to his apostles associates teaching with baptism, and *limits* the administration of the rite to *the taught*. 2d, The Book of the Acts shows how the apostles understood their Master, for they baptised none but believers, or such as appeared to be so. 3d, The kingdom of Christ as it appears in this world is restricted to credibly converted persons, as is shown in his discourse with Nicodemus: 'Except a man be born again, he cannot see the kingdom of God;' whilst his subsequent statements on to the

hour of his memorable confession before Pilate, 'My kingdom is not of this world,' uniformly prove that its subjects and institutes form a distinct and separate community from the Jewish theocracy, which embraced parents and children in nonage in one commonwealth. 4th, They maintain that the ordinance, as explained in the New Testament, always points to a moral and spiritual change, apart from which it were indeed a meaningless ceremony.

As respects the *mode*, the Baptists hold that only immersion in water is baptism. They argue, that the original term *baptizo* conveys this meaning, and no other; that nothing less can possibly answer to the apostle's explanation in Rom. vi. 4, 5; and Col. ii. 12, 'buried with him in baptism, wherein ye were also raised with him'; that the many allusions in the epistles to the churches manifestly bear out this interpretation; and, finally, that the fact of John baptising at a spot selected for the purpose 'because there was much water there,' is perfectly conclusive. For the arguments on the other side, see BAPTISM.

Their form of church-government is congregational. They maintain that the only order of officers remaining to the church, since inspiration ceased, are pastors (otherwise called elders and bishops), deacons, and evangelists; that the number of official persons in each of the apostolic churches cannot be ascertained from the record, but must of necessity have depended—and always must depend—on circumstances; that each church is possessed of the power of self-government under its exalted head, Jesus Christ, subject to no foreign tribunal or court of review; that discipline is to be exercised by the rulers in presence and with the consent of all the members, and parties received or excluded at their voice.

The Baptists are divided among themselves regarding communion—one portion receiving conscientious Pædobaptists to the Lord's table and membership; the other refusing this privilege to any but Baptists. The churches of the former are called open communionists; the latter, strict communionists.

The Baptists were early in the field of missions, their missionary society having been founded in 1792. Theirs has been the honour of planting Christian churches in many parts of India, in Ceylon, in the Bahamas, the West Indies, Africa, and China. No mission band has surpassed the agents of the Baptist Missionary Society in zeal, perseverance, and fortitude. The names of Carey, Marshman, Ward, and Knibb will be had in grateful remembrance by all succeeding generations.

The Baptists have excellent schools for training young men for pastoral duties, presided over by men of great ability. At Bristol, Rawdon (near Leeds), Regent's Park (London), Pontypool, Haverfordwest, and Nottingham, there exist seminaries of learning which are entitled to give certificates qualifying for matriculation at the university of London; and many of the students have already taken degrees and honours there. There are also the Pastors' College, in connection with the Tabernacle, London, and theological institutions at Edinburgh, Manchester, and Llangollen.

In 1886 the Baptists had in the United States (where, next to the Methodists, they are the largest religious body) 31,754 churches, and 2,746,964 members; in Great Britain, Ireland, and the Channel Islands, 2742 churches, with 302,615 members; throughout the world, 37,478 churches, and 3,328,542 members, besides a large number of regular hearers.

Bar, in Heraldry, a diminutive of the Fess (q.v.), or, according to some heralds, a distinct ordinary, consisting of a horizontal stripe across

the shield not exceeding one-fifth of its width. It may be placed in any part of the shield, except ab-

absolutely in chief or base, and is hardly ever borne singly—e.g. argent, two bars-gules (fig. 1). It has two diminutives, the closet and the barrulet, which are respectively a half and a fourth of its width. When barrulets occur in couples they are called bars-gemels—e.g. argent, two bars-gemels gules (fig. 2).

The occasional use in popular language of 'bar sinister' for baton sinister has arisen from *barre* being the French equivalent for a bend sinister. See BATON SINISTER.

Bar, in Hydrography, is a bank of sand, silt, &c. opposite the mouth of a river, which obstructs or *bars* the entrance of vessels. The bar is formed where the rush of the stream is arrested by the water of the sea, as the mud and sand suspended in the river-water are thus allowed to be deposited. It is in this way that deltas are formed at the mouths of rivers. The navigation of many streams is kept open only by constant dredging or other artificial means.

Bar, in Law. This word has several legal meanings; thus, it is the term used to signify an inclosure or fixed place in a court of justice where lawyers may plead. In the superior courts, Queen's Counsel are admitted within the bar; other members of the bar sit or stand outside. A railed-off space within the Houses of Lords and Commons is in like manner called the bar of the House. The dock, or inclosed space where persons accused of felonies and other offences stand or sit during their trial, is also called the bar; hence the expression, 'prisoner at the bar.' It has also a general meaning in legal procedure, signifying something by way of stoppage or prevention. There is also a trial at bar—that is, a trial before the judges of a particular court, who sit together for that purpose in *Banc* (q.v.). See ADVOCATE, BARRISTER, DOWER, FELONY, PLEA, TOLL, TREASON.

Bar, in Music, is a line drawn across the stave, to divide the music into small portions of equal duration; and to indicate the accent, each of these small portions, called *measures*, are also commonly but improperly termed bars. The *double bar* indicates the conclusion of a composition or of a section thereof.

Baraba', a steppe of Siberia, in the government of Tomsk, extending between the rivers Obi and Irtysh, and occupying more than 100,000 sq. m. Covered with salt lakes and marshes, it was colonised in 1767 by the Russians, who have since cultivated parts of it.

Barabra, a Nubian people living on both sides of the Nile from Wady Halfa to Assuan (Egyptian Soudan). They are about 40,000 in number, and are believed to belong to the same stock as the ancient Egyptians. They are an agricultural people, and zealous Mohammedans. Their language has affinities with Coptic.

Baraco'a, a decayed seaport of Cuba, near the east end of the island, founded in 1512, and the capital of the island for some years. Pop. 2900.

Baraguay d'Hilliers, LOUIS, general, was born at Paris in 1764, and, receiving an appointment in the army of Italy from Napoleon, shared all the success of the campaigns of 1796-97. Made a general of division and commandant of Venice,

in 1798 he accompanied the expedition to Egypt; and afterwards successively held appointments on the Rhine, in the Tyrol, and in Catalonia. He commanded a division in the Russian campaign of 1812, but during the retreat incurred the displeasure of Napoleon; and on 8th January 1813 he died at Berlin of grief and exhaustion.—ACHILLE, his son, was born at Paris in 1795, and, entering the army in 1812, next year lost his left hand at the battle of Leipzig. He held a number of appointments up to 1854, when he received the command of the Baltic expedition; and on the capture of Bomarsund, he was made a marshal. In the Italian campaign of 1859 he distinguished himself at Solferino; and during 1870 he was for a brief time commander of Paris. He died at Amélie-les-Bains, 6th June 1878.

Barante, AIMABLE GUILLAUME PROSPER BRUGIERE, BARON DE, a French historian and statesman, born at Riom in Auvergne, June 10, 1782. After filling some subordinate offices, he was appointed in 1800 prefect of La Vendée. In this year was published his *Tableau de la Littérature Française au XVIII^e Siècle*, of which Goethe has said that it contains neither a word too little nor a word too much. In 1815 Louis XVIII. made Barante secretary of the ministry of the interior, and about the same time he took his seat in the Chamber of Deputies, where he voted with the moderate liberals. In 1819 he was raised to the Chamber of Peers. His principal work, a *Histoire des Ducs de Bourgogne de la Maison de Valois, 1364-1477*, published in 12 vols. 1824-28, has run through several editions. It secured his election to the Academy in 1828. Between 1830 and 1840 he represented France at Turin and St Petersburg, but after the revolution of 1848 he devoted himself entirely to literary pursuits. He died, November 23, 1866, at his country-seat in Auvergne.

Baratynski, JEVGENI ABRAMOVICH, an eminent Russian poet, born within the government of Tambov in 1800, became one of the pages at St Petersburg, but was dismissed at fifteen for some boyish freaks. He enlisted as a private soldier three years later, and by seven years' service in Finland fought his way to the rank of an officer, which, however, he soon resigned to devote himself to a literary life. His first poem, *Eda*, is a mirror of Finnish life and feeling; his greatest, *The Gipsy*. He died in 1844 at Naples.

Barbace'na, a flourishing town of Brazil, in the province of Minas Geraes, 125 miles NW. of Rio de Janeiro. It is situated in the Mantiqueira Mountains, about 3500 feet above the sea. Pop. 5000.

Barba'does, one of the Windward Islands, the most easterly of all the West Indies, lies 78 miles E. of St Vincent, in 13° 4' N. lat., and 59° 37' W. long. Its length is 21 miles; its greatest breadth, 14½ miles; and its area, 166 sq. m., or 106,470 acres, of which no less than 100,000 are under cultivation. At Bridgetown, the capital, is the open roadstead of Carlisle Bay, the only harbour, the island being almost encircled by coral-reefs, which here and there extend as much as 3 miles to seaward. Inside these reefs the coast, excepting at two points, presents long lines of sandy beach. The interior is generally hilly, Mount Hillaby, the loftiest summit, rising 1104 feet above sea-level. Setting aside occasional attacks of yellow-fever, leprosy, and elephantiasis ('Barbadoes leg'), the climate is healthy. The temperature is equable; and the average rainfall is 57 inches. Shocks of earthquake are sometimes felt, and thunderstorms are frequent and severe. But hurricanes are the grand scourge of Barbadoes.

In 1780 one of them destroyed 4326 persons, and property to the value of £1,320,564 sterling; and in 1831 another destroyed 1591 persons, and property to the value of £1,602,800 sterling. Of the former of these, the violence almost surpasses belief—the winds and the waves between them having carried a 12-pounder gun a distance of 140 yards. In 1834, the commencement of the apprenticeship under the imperial act of emancipation, the population was 102,231; by 1881 it had increased to 171,889, being an average of 1035 inhabitants to every square mile. About 18,000 are white, and the rest coloured. The trade and the revenue bear a similar testimony to the benefits of emancipation. Between 1833 and 1884, the revenue had increased from £20,975 to £157,762; the imports, from £481,610 to £1,156,329; the exports, from £408,363 to £1,318,878. The succeeding years showed a considerable falling off. Being everywhere cultivated in regular plantations, the island affords no room for the squatting of negroes on unreclaimed lands, as in Jamaica and other West India possessions. On this account, if from no other cause, the negro population have been compelled to labour diligently for hire, and are generally in a condition most creditable to their industry and prudence, contrasting favourably with some of the lower classes among the whites. Altogether, however, the Barbadians are a shrewd and clever people. Barbadoes was made the see of a bishop in 1824; and the bulk of the population belong to the Anglican communion. It contains Codrington College, and many other well-endowed seminaries. It was first colonised by the English in 1625, having previously been depopulated by the Spaniards. The peace of Barbadoes was seriously disturbed in 1876, by riots occasioned by the proposed confederation of the Windward Islands, in which several lives were lost and great damage done to property. See Schomburgk's *History of Barbadoes* (1848).

Barbadoes Cherry, the name given in the West Indies to the fruit of two small trees, *Malpighia urens* and *M. glabra*, which are cultivated for its sake. The fruit of *M. urens* is small, that of *M. glabra* is like a Mayduke cherry in size and appearance, but inferior in flavour. Each fruit contains three stones. The leaves of *M. urens* have stinging hairs on the under side. See MALPIGHACEÆ.

Barbadoes Gooseberry (*Pereskia aculeata*), a pleasant West Indian fruit, produced by a species of Cactus, with a round stem, thick flat alternate leaves, and large strong spines. The flowers are white and ornamental, and the fruit yellow; they are eaten fresh or preserved.

Barbadoes Leg, the same as *Elephantiasis Arabum*. See ELEPHANTIASIS.

Barbara, St., suffered martyrdom at Nicomedia, in Bithynia, in 240 or 306. Her father, Dioscorus, a fanatical heathen, delivered her up to the governor, Martianus, who, struck with her intelligence and beauty, attempted first by arguments to make her relinquish Christianity, and when that failed, had recourse to the most exquisite tortures. At last, her father offered himself to behead her; scarce had he done so when he was struck with lightning. Hence St Barbara is to this day prayed to in storms, and is the patron saint of artillery, being represented in art with cannons, a tower, and a monstrosity. Her festival is 4th December.

Barbara, Celarent, &c., mnemonic words used in logic to denote certain Syllogisms (q.v.).

Barbar'ca. See CRESS.

Barbarian (Gr. *barbaros*), among the Greeks, as early as the time of Homer, signified one who

could not speak the Greek language; and this restricted signification was not wholly obsolete even in the age of Plato, for the latter divides the entire human race into *Hellenes* and *Barbaroi*. Like the Latin *barbarus*, the word is probably onomatopoeic, meant to represent a meaningless babble of sound, such as the Greeks conceived all foreign languages to be. It first began to acquire its secondary and invidious signification at the period of the Persian wars. The Greeks, who always exhibited a proud consciousness of their superior intellect and privileges, employed the term to designate the character of their enemies, as opposed to Greek civilisation, freedom, or intelligence. Subsequently, when Rome, under Augustus, became the mistress of the world, the word was applied to all the Germanic and Scythian tribes with whom she came into contact. In modern times, barbarian signifies savage, uncivilised, or ignorant.

Barbaros'sa. See FREDERICK I.

Barbarossa, HORUK and KHAIR-ED-DIN, two brothers, renegade Greeks, natives of Mitylene, who, as Turkish corsairs, were the terror of the Mediterranean during the first half of the 16th century. The former being invited to Algiers to aid against the Spaniards, treacherously murdered the Emir to whose assistance he had come, seized the town, and began to extend his conquests; but the Arabs summoned the Spaniards to their aid, and in 1518 he was captured and beheaded. The younger brother succeeded him in Algiers, and, having put himself under the protection of the Porte, fortified the town, and even conquered Tunis for the Turks. After Charles V. retook Tunis, Khair-ed-din preyed on the almost defenceless coasts of the Mediterranean, defeated the Christian powers in several sea-fights, and aided the French in taking Nice in 1543. Finally, with thousands of captives, he returned in triumph to Constantinople, where he died, July 4, 1546.

Barbaroux, CHARLES JEAN MARIE, one of the greatest of the Girondists, was born at Marseilles, 6th March 1767. At first an advocate and journalist at Marseilles, he was sent by that city to the Constituent Assembly at Paris. There he opposed the court party, and took part with the minister, Roland, then out of favour. After the events of the 10th of August 1792, he returned to his native town, where he was received with enthusiasm, and was soon after chosen delegate to the Convention. In the Convention he adhered to the Girondists, and belonged to the party who, at the trial of the king, voted for an appeal to the people. He boldly opposed the party of Marat and Robespierre, and even directly accused the latter of aiming at the dictatorship; consequently he was, in May 1793, proscribed as a royalist and an enemy of the republic. He fled to Calvados, and thence with a few friends to the Gironde, where he wandered about the country, hiding himself as he best could for about thirteen months. At last, on the point of being taken, he tried to shoot himself; but the shot miscarried, and he was guillotined at Bordeaux, June 25, 1794. This 'brave and beautiful young Spartan' was one of the great spirits of the revolution. There was no loftier-minded dreamer in the Girondist ranks; hardly a nobler head than his fell in that reign of terror. He was 'ripe in energy, not ripe in wisdom,' says Carlyle, or the history of France might have been different.

Bar'bar'y, an extensive region in Northern Africa, comprising the countries known in modern times under the names of Barca, Tripoli Proper, Fezzan, Tunis, Algeria, and Morocco; and in ancient times, under those of Mauritania, Numidia,

Africa Propria, and Cyrenaica. It stretches from Egypt to the Atlantic Ocean, and from the Mediterranean to the Desert of Sahara, or between 10° W. and 25° E. long., and 25° to 37° N. lat. The north-west of this region is divided by the Atlas Mountains into two parts. Though pertaining geographically to Africa, Barbary is not specially African in any of its characteristics; but in climate, flora, fauna, and geological configuration, belongs to that great region which forms the basin of the Mediterranean. Among the races, besides French and other Europeans, may be mentioned Berbers (Kabyles in Algeria), Moors (or Arabs), Jews, Turks, Kulungis (mixed Moors and Turks), and Negroes. The history of Barbary is a record of successive conquests by Romans, Vandals, Arabs, Turks, and the French (1830). See BERBERS, MOORS, ALGERIA, &c.

Barbary Ape, **PIGMY APE**, or **MAGOT** (*Macacus sylvanus*, or *Inuus ecaudatus*), a small species of tail-less monkey, interesting as the only form now found in Europe, where it is restricted, however, to the Rock of Gibraltar. There can be little doubt that before the strait was formed which now separates the continents, the ancestors of the Gibraltar family wandered over from Africa in an entirely natural way. The magot inhabits the precipitous sides of the rock, feeding it is difficult to know how, and enjoys a certain measure of protection from firearms in return for the amusement afforded by its manners. It is said on one occasion to have had historic importance by warning the British occupants of a Spanish surprise. Large numbers are often seen together, the females carrying the young upon their backs. It is extremely abundant in some parts of North Africa, inhabiting rocky mountains and woods, displaying great agility in passing from tree to tree, and

Barbary Ape.

often descending in herds to plunder gardens and plantations. It feeds on fruits, roots, &c.; and its fondness for eggs may have given rise to the ancient story of the battle of the pigmies and the cranes. It is of a yellowish-brown colour, paler underneath; and in size resembles a middle-sized dog. The characters generally agree with those of other macaques, differing most conspicuously in the stump-like rudiment of a tail, provided, however, with the usual muscles. The absence of tail and the length of the muzzle make the magot somewhat baboon-like. It is one of the commonest imported monkeys, being often seen in a consumptive state in the company of an organ-grinder, and is capable of learning any number of tricks. In order to this, however, it must be taken young, as the older ones are often sullen and mischievous. It usually walks on four feet, although it can be trained to stand or walk, in a more awkward manner, on two. It is filthy in its habits. Its anatomy was first studied by Galen in the 2d century, and the animal is thus of some historic

interest, as it supplied him with an opportunity of understanding by analogy the anatomy of man when obscurantist regulations made the dissection of the human body all but impossible.

Barbastelle, a bat with hairy lips, a native of England. See BAT.

Barbastro, a town of Spain, in the province of Huesca, 44 miles NW. of Lerida by rail. It is situated on the Vero, and has a cathedral dating from the end of the 15th century. Pop. (1877) 8164.

Barbauld, ANNA LETITIA, an English authoress, was born in 1743, at Kibworth-Harcourt, Leicestershire, where her father, the Rev. John Aikin, D.D., a dissenter, kept an academy. Her private education, the religious influence of her home, and her secluded life in the country, were well fitted to develop early her natural taste for poetry; but it was not until 1773 that she published her *Poems*, which ran through four editions in the twelvemonth. Encouraged by this, she the same year, conjointly with her brother, John Aikin (q.v.), published *Miscellaneous Pieces in Prose*. Next year she married the Rev. Rochemont Barbauld, a dissenting minister at Palgrave, Suffolk, in which village the newly married pair opened a boys' boarding-school, which was soon made celebrated by Mrs Barbauld's literary fame and assiduity. During the ten years spent here she published *Early Lessons for Children*, her best work; *Hymns in Prose*, and *Devotional Pieces*. In 1792 she commenced with the same brother the well-known series, *Evenings at Home*. In 1810 she published a collection of the British novelists, the task of editing which she had undertaken to divert her mind from the suicide of her husband two years before. Her last poetical effort was an ode, *Eighteen Hundred and Eleven*, in which she anticipated Macaulay's *New Zealander*. All her compositions are characterised by an old-world grace, an easy, flowing style, pure and elevated sentiment, and give token of a mind well versed in classical literature. She died at Stoke-Newington, 9th March 1825. See the Memoir by Lucy Aikin, prefixed to the collection of the *Works of A. L. Barbauld* (2 vols. 1825); the *Lives by Mrs Le Breton* (1874) and Grace Ellis (Boston, U.S. 1874); and Miss Thackeray's *Book of Sibyls* (1883).

Barbecue, the name given in America to a hog, ox, or any large animal broiled or roasted whole, and now applied in the United States to a large social entertainment, generally in the open air, where animals are roasted whole, and food and drink of all kinds provided on a generous scale.—The word is probably derived through the medium of Spanish from a Haitian *barbacoa*, 'a framework of sticks raised upon posts,' used for supporting above the fire meat that is to be smoked or dried.

Barbed, as a heraldic term, is applied to an arrow whose head is pointed and jagged; also to the five green leaves, or more properly sepals, which are shown between the five petals of the conventional Rose (q.v.) of Heraldry.

Barbel (*Barbus*), a genus of fishes in the family of the Cyprinidæ (q.v.), differing from *Cyprinus* (Carp, Gold-fish, &c.) in the short dorsal and anal fins, in having one of the rays of the dorsal fin strong and serrated, and the mouth furnished with four soft tactile barbules (whence the name barbel, from Lat. *barba*, 'a beard'), two near the point of the snout, and one at each angle of the leathery mouth. The upper jaw also extends considerably beyond the lower. The species are very numerous. Like the other Cyprinidæ, they are all inhabitants of fresh water, and generally of muddy ponds and rivers, where they seek food, especially at night, by

plunging up the mud with their snouts like swine, and are said often to seize the small fishes which come to share the worms and insects which they turn up. They also feed upon the leaves and roots of aquatic plants.—The Common Barbel (*B. vulgaris*) is abundant in many of the rivers of the

Barbel.

temperate parts of Europe, such as the Weser, Elbe, and Rhine. It is the only species found in Britain, and there only in some of the still and deep English rivers. It is very abundant in the Thames, frequenting the weedy parts of the river in shoals in summer, and seeking the deeper water in winter, becoming so torpid during cold weather, that the fishermen sometimes take it with the hand, or by pushing it with a pole into a small net fastened to an iron hoop. It grows to a large size, sometimes 3 feet in length, and 15 to 18 pounds in weight; it has a long shape, in section nearly circular; the general colour of the head and upper part of the body, greenish brown, becoming yellowish green on the sides, the belly white, the fins red, and the tail of a deep purple colour. It affords sport to anglers, and is much fished about London, but is a very coarse fish, and little used for food except by the poor, who often boil bacon with it to give it a relish. The flesh is said to be improved by being kept for some days in fresh water. The larger barbels are esteemed the best. The eggs, which are very numerous, are deposited in strings about stones, and the roe has poisonous qualities, although its effects are disagreeable rather than permanently injurious.—A species, called the Binny, or barbel of the Nile, is very abundant in that river; it attains a very great size, 70 lb. or upwards.

Barber, a shaver of the beard (Lat. *barba*), and usually also a hair-cutter. Barbers are of great antiquity; the office of the barber is referred to by the prophet Ezekiel (v. 1). In all oriental countries, including China, the shaving the whole or part of the head continues to be performed by barbers. In every part of the world, the professional barber and hairdresser is celebrated for his garrulity and general obliging qualities, such being required by those who place themselves in his hands. The amusing character of the barber in one of the tales in the *Arabian Nights*, and also of the barber in Rossini's opera of *Figaro*, will readily occur to recollection. Barbers at one time acted as a kind of surgeons, and accordingly occupied a higher social position than they now enjoy. Latterly, on account of the simple mode of trimming the hair, and of the prevalence of private shaving, the business of the barber in England has greatly declined, and his services are much more confined to the humbler classes. In the United States, the business of the barber is largely in the hands of the coloured population. Anciently, one of the utensils of the barber was a brass basin, with a semicircular gap in one side to compass a man's throat, by which means, in applying the lather to the face, the clothes were not soiled. Readers will recollect that Don Quixote assumed a barber's basin as a helmet—Mambrino's. At the end of a pole, the brass basin is

still hung out as a sign at the door of the barber in Scotland, Germany, and other countries.

In former times, as already stated, barbers acted as a kind of surgeons, or at least phlebotomists, and such appears to have been the case in all countries. Till this day, on the barber's pole, there is represented a twisted or spiral ribbon, which symbolises the winding of a ribbon round the arm previous to blood-letting. In London, Edinburgh, and elsewhere, the barbers formed corporations with certain privileges. The surgical duties of these bodies now pertain to the corporations of surgeons. The Company of Barber-surgeons was first incorporated by Edward IV. in 1461; in 1540 its title was changed to 'Company of Barbers and Surgeons,' and the practitioners of 'barbary' were restricted to drawing of teeth. In 1545 an act was passed, from whose preamble we learn that the discovery had been made that the business or trade of a barber was 'foreign to, and independent of, the practice of surgery;' and it therefore dissolved the connection between the two bodies, and remitted the barbers to the more humble functions they now perform. But this is done with an express saving of all their privileges as a company or corporation, and as such they exist to the present day. The barbers still retain their ancient hall—which they possessed before the surgeons were disunited from them—in Monkwell Street, Cripplegate, in the city of London. See BEARD, GUILDS, SURGEONS.

Barberini, an Italian family, originally of Tuscan origin, that acquired wealth by trade in the 16th century, rose to the front rank among the Roman nobility, and many of whom were successively cardinals. The family rose to power and influence on the elevation of Maffeo Barberini as Urban VIII. to the papal chair in 1623. His brother Antonio became cardinal; Carlo, general of the papal troops; while to a son of the latter, Taddeo, was given the principality of Palestrina and other fiefs. Francesco (1597-1679), brother of Taddeo, cardinal and vice-chancellor, was founder of the Barberini Library; another brother, Antonio (1608-71), was cardinal and high-chamberlain under Urban VIII. Their increasing power and grasping ambition excited the jealousy of the neighbouring princes, and led to the war (1641-44) in which Odoardo, Duke of Parma, defeated the papal troops. Under Urban's successor, Innocent X., proceedings were instituted against the Barberini, who fled to France; but returned again to Italy in 1652. The principality of Palestrina has belonged since 1630 to the family, while their palace at Rome—long the resting-place of the Portland Vase (q.v.)—gives evidence of their wealth and splendour. Barberino di Val-d'Elsa, a village near Florence, the birthplace of Urban VIII., gives name to the family, one of their palaces being here.

Barberry (*Berberis*), a genus of plants, of the natural order Berberideæ (q.v.). All the species, which number about 100, and range through the temperate regions of the world, with the exception of Australia and South Africa, are shrubs with yellow flowers, having their parts usually in multiples of three. The stamens are sensitive, moving inwards when irritated, so as to dust the insect visitor with pollen, and so facilitate cross fertilisation. The fruit is a berry with two or three seeds. The genus is divided into two sections—those with simple leaves, whether deciduous or evergreen, forming the sub-genus *Berberis* proper, and those with pinnate evergreen leaves, the sub-genus *Mahonia*.—The Common Barberry (*B. vulgaris*) is a native of the Palearctic region, but has been

introduced into the United States; it is a very ornamental shrub, especially when covered with its brightly coloured berries. The fruit of the ordinary varieties is too acid to be eaten, but makes excellent preserves and jelly, and is also a convenient source of malic acid. Although an

a, Flowering branch, and b, fruit, of Common Barberry (*Berberis vulgaris*);
c, Branch in fruit of *B. Darwintii*.

excellent hedge-plant, its extirpation in such localities is advisable, since (as was indeed suspected by agriculturists long before it was demonstrated by De Bary) it furnishes the intermediate host for the 'alcidium-stage' of the fungus which occasions the *rust* of wheat (see *RUST*). The yellow root and bark has been used in dyeing, and numerous species are so employed in Chili and Peru, and in the Himalayas; the astringent bark has also been used in tanning. *B. Lycium* is peculiarly astringent, and its extract is employed in North India in ophthalmia. *B. dulcis*, the Sweet Barberry, is a native of Chili; its fruits resemble in size and colour those of the black currant. Wholesome and pleasant fruits are produced also by *B. aristata* and *B. asiatica*, the berries of both of which are dried in Nepal, after the manner of raisins, and by several other species; but more frequently they are insipid or harsh, especially in *Mahonia*. New species and varieties are frequently introduced, and are ornamental, easily cultivated additions to the shrubbery.

Barberton, a mining-town of the Transvaal, at the De Kaap gold-fields. It is situated at the base of a high range of hills 2500 feet above sea-level, 292 miles N. of Durban, with which there is connection by coach. Since 1883 gold prospecting in the Transvaal had begun to attract more attention, and in 1886-87, owing to the announcement of the discovery of rich reefs in this neighbourhood, there was a 'rush' to the place, which is named after one of the earliest prospectors. The population, about 8000 in 1887, was being rapidly augmented from all quarters.

Barbet (*Bucco*), a genus of birds typical of a family generally placed beside the Picidae, or Woodpeckers (q.v.), and also exhibiting points of resemblance to the cuckoos. They have a large conical beak, bearing at the angle of the mouth tufts of stiff bristles directed forwards—a characteristic from which the name barbet is derived (Lat. *barba*, 'a beard'). They prey on insects, some

of them also on young birds, and some at least partially frugivorous. They inhabit warm parts both of the eastern and western hemispheres, and most of them are birds of gay plumage. The Barbicans (*Pogonias*), the American Puff-birds (*Tamatia*), and other genera, are included along with the barbets in the family Bucconidae; but it must be noted that not a few forms once referred to the genus *Bucco* are now known under different titles. See PUFF-BIRDS.

Barbette, an earthen terrace inside the parapet of a rampart, serving as a platform for heavy guns, and having such an elevation that the guns may be fired over the crest of the parapet instead of through the embrasures, to give them a freer scope by swivelling round into different directions.

Barbican (Old Fr. *barbacane*, also in Spanish, Portuguese, and Italian forms; perhaps of Arabic or Persian origin—Colonel Yule suggests *bāb-khānah*, 'gate-house,' the usual name in the East for a towered gateway), a projecting watch-tower over the gate of a castle or fortified town. The term barbican was more specially applied to the outwork, intended to defend the drawbridge, which

Barbican at Carcassonne.

in modern fortifications is called the *tête du pont*. There are a few perfect barbicans remaining in England, as at Alnwick and Warwick; but the best example of one, as well as of the other parts of the fortification of the middle ages, is probably to be seen at Carcassonne. The street called Barbican in London, near Aldersgate Street, marks the site of such a work, in front of one of the gates of the old city.

Barbier, (1) ANTOINE ALEXANDRE, a French bibliographer, born at Coulommiers, January 11, 1765. Bred to the church, he subsequently left his curacy, married, and in 1794 removed to Paris, where he was appointed to collect and place in the public libraries the books of the suppressed monasteries. In 1798 he became librarian to the Directory, and as private librarian to Napoleon (1807), founded the libraries of Fontainebleau, Compiègne, St Cloud, and the Louvre. He held the same appointment under the Bourbons until 1822, and died in Paris, December 5, 1825. His most important work is his *Dictionnaire des Ouvrages Anonymes et Pseudonymes* (Paris, 1806-9; 3d ed. 4 vols. 1872-79).—(2) HENRI AUGUSTE, a French satirist, born at Paris, April 28, 1805. Abandoning the bar for a literary career, he made a first venture with an historical novel, but the Revolution of July 1830 led him to make his first essay in the field of satirical poetry. His satires of this period are collected in a volume entitled *Jambes* (1831), which has been so popular that a 31st edition appeared in 1892. His subjects include office-seeking and the greed and ambition

of public men, the corruption of public morals, and the mania for committing suicide. But his later works show an astonishing falling off, and are all distinctly inferior to his earlier efforts. The list includes *Il Pianto* and *Lazare*, republished together (1837) under the title *Satires et Poèmes*; *Pot-de-Vin* (1840), *Rimes Héroïques* (1843), a metrical translation of Shakespeare's *Julius Cæsar* (1848), *Silves, Poésies Diverses* (1864), *Satires* (1865), a volume of romances, *Trois Passions* (1867), and his posthumous *Souvenirs* (1883) and *Poésies* (1884); but in none can the brilliant author of *Iambes* be recognised. He was elected a member of the French Academy in 1869, and died at Nice, February 14, 1882.—(3) PAUL JULES, a French dramatist, born at Paris, March 8, 1825. His first drama, *Un Poète*, was produced with considerable success at the Théâtre Français in 1847. Since then he has written numerous dramas, comedies, and vaudevilles, and furnished, often with the collaboration of Carré, a constant succession of libretti for Gounod, Thomas, Massé, and Meyerbeer.

Barbou, the name of a celebrated French family of printers, the descendants of John Barbou of Lyons, who lived in the 16th century. From his press issued the beautiful edition of the works of Clement Marot in 1539. His son, Hugh Barbou, removed from Lyons to Limoges, where, among other works, his celebrated edition of *Cicero's Letters to Atticus* appeared in 1590. Joseph Gerard Barbou, a descendant of the same family, settled in Paris, and continued in 1755 the series of Latin classics in duodecimo—rivals to the Elzevirs of an earlier date—which had been begun in 1743 by Consteller. This series of classics is much prized for its elegance and correctness.

Barbour, JOHN, the father of Scottish poetry and history, regarding whose life but little is on record beyond the production of the national epic, *The Brus*. Nothing is known of his parentage, and of his birth it can only be conjectured to have been about 1316. The ascertained facts of his life are few. We are informed only that in his own age he was accounted a man of great learning and worth; that he was Archdeacon of Aberdeen as early at least as 1357, and held that office till his death in 1395; that in 1357 he travelled into England, accompanied by three scholars, for the purpose of studying at Oxford; that he repeated his visit to England for the same purpose in 1364; that in 1365 he obtained a passport 'to travel through England with six companions on horseback towards St Denis and other sacred places'; that in 1368 he again received permission to travel through England with two servants and two horses, on his way to France; that in 1373 he was clerk of audit to the household of King Robert II., and one of the auditors of exchequer; that in 1375 his great poem was more than half finished; that in 1377 he had a gratuity of ten pounds from the king; that in 1378 he received a perpetual annuity of twenty shillings, which in 1380 he bequeathed to the dean and chapter of Aberdeen, under the condition that they should sing a yearly mass for the repose of his soul; that in 1381 he had a gift from the crown of the ward of a minor, whose estate lay within the parish of which he was rector; that in 1382, and again in 1384, he was one of the auditors of exchequer; that in 1388 a further pension was granted him of ten pounds a year; and that he died on 13th March 1395, his anniversary in the cathedral of Aberdeen being celebrated on that day until the Reformation. Besides *The Brus*, Barbour wrote other two poems, one, now represented only by two fragments, on the Troy legend, and *The Book of Legends of the Saints*,

discovered by Mr Bradshaw in Cambridge University Library. Modelled on the *Thebais* of Statius, *The Brus* is distinguished by great purity and clearness of style, the language and versification contrasting advantageously with those of any contemporary English poet, not even Chaucer excepted. Barbour's imagery is not rich, but he is seldom other than lively, simple, and energetic. He has depicted, in rough but faithful outline, the life, manners, and deeds of a truly heroic age, and given to his country the first poem in her literature, and the earliest history of her best and greatest king. *The Brus*, first printed at Edinburgh in 1571, has been reprinted by Dr Jamieson in 1820; by Cosmo Innes, for the Spalding Club, in 1856; and by Professor Skeat, for the Early English Text Society, in 1870-77. Of the *Legends of the Saints* there is an excellent German edition by Horstmann (2 vols. Heilbronn, 1881-82).

Barbu'da, one of the Lesser Antilles, West India Islands, lying 30 miles to the north of Antigua, of which it is a dependency. It is about 10 miles long by 8 broad, with an area of 75 sq. m., and a pop. of 850. The island is fertile, but the greater part of the interior is a dense forest. Barbuda is of coral formation, and is beset with reefs.

Barby, a town of Prussian Saxony, on the left bank of the Elbe, 15 miles SE. of Magdeburg. It is well built, and has an old castle. Pop. (1885) 5522, engaged in sugar-refining, shipbuilding, agriculture, and river navigation.

Barca, a country extending along the northern coast of Africa, between the Great Syrtis (now called the Gulf of Sidra) and Egypt. Bounded on the W. by Tripoli, and on the S. by the Libyan Desert, it is separated from Egypt on the E. by no definite line. It nearly corresponds with the ancient Cyrenaica (q.v.); and a great part of it is a high plateau. The climate is healthy and agreeable in the more elevated parts, which reach a height of almost 2000 feet, and in those exposed to the sea-breeze. There are none but small streams, but the narrow terrace-like tracts of country are extremely fertile, realising all that is said of the ancient Cyrenaica. Rice, dates, olives, saffron, &c. are produced in plenty. The pastures are excellent; the horses still celebrated, as in ancient times. But the good soil extends over only about a fourth of Barca: the east exhibits only naked rocks and loose sand. Many ruins in the north-western parts attest its high state of cultivation in ancient times, when its five prosperous cities bore the title of the Libyan Pentapolis. So early as the time of Cyrus, Barca became a state, which proved dangerous to the neighbouring state of Cyrene; but within a single century it sank, and became subject to Egypt. In the Roman period, its inhabitants were noted for their predatory incursions. It was afterwards a province of the Greek empire, and had declared itself independent when the Arabs invaded and conquered it in 641. The present inhabitants consist of Arabs and Berbers. Barca was formerly a department of Tripoli; but in 1879 it was raised to the rank of an independent province, governed directly from Constantinople. Its area is 60,700 sq. m.; and the pop. somewhat exceeds 300,000. The capital is Bengazi (q.v.).

Barcarolle (Ital. *barcaruolo*, 'a boatman'), a species of song supposed to have originated amongst the gondoliers of Venice, having a simple, regular melody, in a rhythm corresponding to the stroke of the oar. The name is applied to musical compositions for voice or pianoforte of a similar character; and its form has been freely used by Auber, Mendelssohn, and Chopin.

Barcello'na and **Pozzo di Gotto**, two towns of Sicily, in the province of Messina, standing close together, so as really to form one town, the two parts of which are separated by a small stream, about 22 miles WSW. of Messina. Pop. of the two towns (1881) 13,948. Barcellona is situated in a broad plain, between the mountains and the sea, abounding in corn, wine, oil, and fruit, and has sulphur-baths.

Barcelo'na, the second largest and the most important manufacturing city in Spain, in the province of the same name, is beautifully situated on the Mediterranean between the mouths of the Llobregat and the Besos, in the midst of a district as luxuriant as a garden. By rail it is 228 miles E. of Saragossa and 439 ENE. of Madrid. The ramparts and citadel have given place to the expansion of the city, and the ground formerly covered by the citadel has been laid out in gardens. The castle of Montjuich commands the town from the south, and the arsenals near by comprise infantry and cavalry barracks for 7000 men. Barcelona is divided into two parts—the old town and the new—by the *Rambla* (river-bed), which has been formed into a beautiful promenade. There is another fine promenade, the *Muralla del Mar*, or sea-wall. The streets of the old town, forming the north-west division, are crooked, narrow, and ill paved. The buildings are chiefly of brick, four or five stories high, with flat roofs. Those of the new are much more modern in appearance, spacious, and regular. There is a large suburb to the SE. of the town, called *Barceloneta*, where the seafaring portion of the population chiefly reside. The suburbs of *Gracia* (35,000 inhabitants), to the NW., and *Sarria*, are favourite holiday and summer evening resorts of the inhabitants. Barcelona is the see of a bishop. It has a university (1430; rebuilt 1873) attended by 2500 students, and colleges and schools; public libraries, in one of which there is a splendid collection of MSS.; several hospitals and other charitable institutions; a dozen theatres, one of them capable of holding 4000 spectators; numerous ancient and elegant churches; eighteen convents, and a cathedral which, begun in 1298, is not yet completed. Electric lighting has been introduced, and an International Exhibition was held here in 1888. Barcelona manufactures silk, woollens, cottons, lace, hats, firearms, hardware, blocks from stone-dust, &c., which form its principal exports. Its fabrics are inferior to English goods, and it is said that they are exported to England and reimported with British marks and labels. The staple imports are raw cotton, coffee, sugar, and other colonial produce; also wheat, spirits, timber, salt-fish, hides, wax, iron, and coal. Its export trade is largely confined to fruits, vegetables, wines, silk, oil, and salt. Next to Cadiz, it is the most important port in Spain. The number of ships annually entering and leaving the port is about 4000, with a tonnage of 1,700,000. The harbour was extended and its entrance improved in 1875, but great engineering skill and constant dredging have been required to convert the open roadstead into a safe harbour. The annual imports average 10 to 12 millions sterling; but the decadence of the export trade has become every year more pronounced, its value being returned in 1886 at £105,000. The city has excellent railway communication, with lines of tramway for street traffic. Steamers run to various Mediterranean ports, including the Balearic Islands. In 1864 the population was 190,000; in 1868 it had been reduced (mainly by cholera) to 167,095; (1878) 249,106; (1884) 246,400. Since then it has grown very rapidly, and the population of the city, with its suburban towns and villages, was officially estimated in 1887 at 430,000.—The province of

Barcelona has an area of 2950 sq. m., and a population of (1884) 849,887.

Barcelona is a place of great antiquity, and associated with many historical events. Local tradition fixes the date of its foundation 400 years before the Romans; and it is said to have been refounded by Hamilcar Barca, the father of Hannibal, from whom its ancient name, *Barcino*, was derived. An important city under the Romans, Goths, and Moors, Barcelona in 878 became an independent sovereignty, under a Christian chief of its own, whose descendants continued to govern it, and to hold the title of Counts of Barcelona until the 12th century, when its ruler adopted the title of King of Aragon, to which kingdom it was annexed. During the middle ages, Barcelona became a flourishing seaport, rivalled in the Mediterranean by Genoa only. To its commercial code, framed in the 13th century, much deference was paid by the whole of Europe; and it was at this time 'a city of commerce, conquest, and courtiers; of taste, learning, and luxury; and the Athens of the troubadour.' It was one of the first cities of Spain into which printing was introduced. Columbus was received here in 1493 by Ferdinand and Isabella, after his discovery of America. Here also a ship was launched in 1543, which was moved by means of steam. In 1640 it appealed to France against the tyranny of Philip IV.; but it turned against that country in the war of the Spanish Succession, and adhered to Austria. In 1705 the fortress of Montjuich was surprised and captured by Lord Peterborough, and the city surrendered shortly afterwards. In 1714, after a most heroic defence, it was stormed by the Duke of Berwick, on behalf of Louis XIV., and given over to fire and sword. Napoleon perfidiously obtained possession of it in 1808; and with one or two reverses, and in the face of great difficulties, it was held by the French until the treaty of peace concluded in Paris in 1814. For 13 years, Barcelona remained quiet under the iron rule of *España*; but in 1827 its old turbulent spirit returned, and it rose in favour of Don Carlos. Since that time Barcelona has generally supported the government. But a Progressist rebellion in 1856 caused much bloodshed, and in 1874 the Federalists raised an insurrection here.

Barcelona, formerly called New Barcelona, capital of a district in the state of Bermudez, Venezuela, stands near the mouth of the Neveri, 160 miles E. of Caracas. The surrounding country is fertile, but Barcelona is very unhealthy. Cattle, jerked-beef, hides, indigo, cotton, and cacao are the chief exports. Pop. 12,000.—The district, formerly a separate state, has since 1881 formed one of the divisions of the state of Bermudez.

Barclay, ALEXANDER, poet and prose-writer, was born about 1475, almost certainly in Scotland, may have studied at either or both of the English universities, and then travelled in France and Italy. Some time before 1508 he was appointed, through Bishop Cornish, a priest of Ottery St Mary, Devonshire. About 1511 he became a monk of the Benedictine monastery of Ely; later he assumed the Franciscan habit at Canterbury; and he died at Croydon in June 1552, six weeks after he had been presented to the rectory of All-Hallows, London. His claim to notice rests chiefly upon his famous poem, *The Ship of Fools of the Worlde*—partly a translation, and partly an imitation of the German *Narrenschiff* by Sebastian Brandt (q.v.)—printed by Pynson in 1509. He also published *The Castell of Laboure*, *The Egloges* (Eclogues), a translation of Sallust's *History of the Jugurthine War*, &c. See the admirable edition of the *Ship of Fools* by T. H. Jamieson (2 vols. Edin. 1874).

Barclay, JOHN, author of the *Argenis*, was born in 1582, at Pont-à-Mousson in Lorraine, where his father, a Scotsman, was professor of Law. Owing, it is said, to persecution on the part of the Jesuits, he came with his father to England about 1603, and either in that year, or two years later, he published his *Euphormionis Satyricon*, a politico-satirical romance, chiefly directed against the Jesuits, supplements to which were the second part (1607), the *Apologia* (1611), and the *Icon Animorum* (1614). In 1616 he left England, and went to Rome, where he died, a good Catholic, in 1621. In the same year appeared his *Argenis*, according to Cowper, 'the best romance that ever was written.' It was written in Latin, and has been translated into Spanish, Italian, Polish, &c. There are no fewer than three English versions, the last by Clara Reeve in 1772. It is a political allegory, containing clever allusions to the state of Europe, more particularly of France, during the time of the League; and has merited the admiration of readers as dissimilar as Richelieu, Leibnitz, and Coleridge. See Dupond, *L'Argenis de Barclai* (1875).

Barclay, JOHN, M.D., anatomist, was born 10th December 1758, in Perthshire, Scotland, and died in Edinburgh, 21st August 1826. He was educated at St Andrews, and studied for the ministry, but afterwards devoted himself to medicine. He obtained the degree of M.D. from the university of Edinburgh in 1796, where he became a private lecturer, and in 1804 he was formally recognised as lecturer on anatomy and surgery by the College of Surgeons. He was mainly instrumental in founding the Dick Veterinary College in Edinburgh. He published between 1803 and 1822, *A New Anatomical Nomenclature, Muscular Motions, Arteries of the Human Body*, and *An Inquiry into the Opinions concerning Life and Organisation*.

Barclay, REV. JOHN (1734-98), the founder of the Bereans (q.v.).

Barclay, ROBERT, the celebrated apologist of the Quakers, was born at Gordonstown in Morayshire, December 23, 1648. His father belonged to an old Scottish family, had served under Gustavus Adolphus, and was in some trouble after the Restoration for his conformity with Cromwell. Robert was educated at the Scots College at Paris, of whom his uncle was rector; and here he withstood every temptation to embrace the Roman Catholic religion, and returned to Scotland in 1664, in compliance with the wish his mother had expressed on her death-bed. In 1667 he followed the example of his father—a convert in 1666—and joined the Society of Friends, for reasons more highly respected in our day than in his own. He states in his *Treatise on Universal Love*, that his 'first education fell among the strictest sort of Calvinists,' those of his country 'surpassing in the heat of zeal not only Geneva, from whence they derive their pedigree, but all the other so-called reformed churches;' that shortly afterwards, his crossing to France had thrown him among the opposite 'sect of papists,' whom, after a time, he found to be no less deficient in charity than the other; and that, consequently, he had refrained from joining any, though he had listened to several. The ultimate effect of this was to liberalise his mind, by convincing him of the folly and wickedness of religious strife. In both Calvinists and Catholics he found an absence of 'the principles of love,' 'a straitness of doctrine,' and a 'practice of persecution,' which offended his idea of Christianity, as well as the gentleness and generosity of his nature. He therefore allied himself gladly to this new sect, whose distinguishing feature was its

charity and pure simplicity of Christian life, and soon became one of its most devoted adherents and its ablest advocate. He continued to prosecute his studies ardently, married Christian Mollison in 1670, became involved in controversies in which he showed himself the superior in logic and learning, no less than in tolerance. In 1672 he startled the self-complacent city of Aberdeen by walking through its streets in sackcloth and ashes. He suffered much persecution, and was frequently imprisoned, but at last found protection in the favour of the Duke of York, afterwards James II. He made several journeys into Holland and Germany, the last in company with William Penn and George Fox. He continued to have much influence with King James, was one of the twelve Quakers who acquired the proprietorship of East New Jersey in 1682, and was appointed its nominal governor. He was a frequent visitor to London, but continued to live at Urie, where he died, leaving three sons and four daughters, October 3, 1690. His estate remained in his family till the death of Captain Barclay, the famous pedestrian, in 1854. Barclay's works were collected in 1692 in a folio volume, entitled *Truth Triumphant*, republished in 3 vols. in 1717-18. Of these the greatest is *An Apology for the True Christian Divinity, as the same is held forth and preached by the People called in scorn Quakers* (1678). It contains a statement and defence of fifteen religious propositions peculiar to the Friends. The leading doctrine which runs through the whole book is, that divine truth is made known to us not by logical investigation, but by intuition or immediate divine revelation to the heart of the individual; and that the faculty by which such intuition is rendered possible is the 'internal light,' the source of which is God, or, more properly, Christ, 'who is the light that lighteth every man that cometh into the world.' This light is given to every man, but is obscured by human corruption. The authority of the Scriptures gives only a 'secondary rule,' subordinate to that of the inward light, and the ordinary Augustinian notions of justification, perfection, and perseverance, imply rather a change in the outward relations than a transformation of the soul that accepts the divine light. The identity of this in the main with the teaching of a large school within the English church of the present day, is obvious. The fourteenth proposition deals with the question of toleration and the right of freedom for the conscience, his assertion of which fits well with his theory of divine light within all men of whatever creed or country. The author distinguishes carefully between the divine light and natural reason; but others who identify the two, find in Barclay's great work a series of excellent arguments for deism. Indeed, he was accused of deism even in his own time, and he is mentioned with favour by Voltaire. Brown of Wamphray, in his *Quakerism the Pathway to Paganism* (1678), denounces the 'hellish neo-paganism' of this 'devil in Samuel's mantle,' and speaks of his 'serpentine venom' as 'sugared over with fair speeches.' Barclay's famous work has often been reprinted, and has been translated into most of the European languages. His *Treatise on Universal Love* (1677) was the first of that long series of noble and gentle remonstrances against the criminality of war that has so honourably distinguished the Society of Friends.

Barclay-Allardice, ROBERT, known as Captain Barclay, the pedestrian, was born in 1779, and succeeded to the estate of Urie, near Stonehaven, in 1797. He entered the army (1805), and served in the Walcheren expedition (1809), but afterwards devoted himself to agriculture, cattle-breeding, and the claiming of earldoms (Airth, Strathearn, and

Menteith). He died 8th May 1854. His great feat of walking 1000 miles in 1000 consecutive hours took place at Newmarket in June to July 1809. See W. Thom's *Pedestrianism* (1813).

Barclay de Tolly, MICHAEL, PRINCE, a famous Russian general, was born in 1761 in Livonia. He was descended from the same Scottish family to which Barclay the poet and the Quaker apologist both belonged, and two of the branches of which had settled in Mecklenburg and Livonia. Entering a Russian regiment of cuirassiers as a sergeant, he fought with great bravery in the Turkish war of 1788-89, in the campaign against Sweden in 1790, and in those against Poland in 1792 and 1794, and rose rapidly in rank. He commanded Benningsen's advanced-guard at Pultusk in 1806; and lost an arm at the battle of Eylau. Scarce recovered from his wound, he took part in the war in Finland, defeated the Swedes, crossed the Gulf of Bothnia on the ice at the head of 6000 men, and quickly forced the enemy to sue for peace. Spite of his unpopularity as a German with the Russian national party, he was appointed minister of war by the Emperor Alexander in 1810—an office which he held till 1813. In 1812 he was made commander-in-chief of the army of the west. Here, though face to face with the greatest general and one of the finest armies of modern times, he showed himself such a consummate tactician that his defeats never became disasters. The plan of defence during the campaign is generally ascribed to his insight and wisdom. His advice was to avoid battles and retreat into the interior before the French, leaving the country behind them a desert, and thus the Russian army would ever become stronger as the French grew weaker. He had offered the same advice after Eylau in 1807, but Bagration, the impetuous leader of the second army, was eager to assume an offensive attitude, and the army, weary of constant retreat, supported him against his more cautious colleague. Accordingly, Barclay de Tolly was forced to give battle at Smolensk, and in consequence of his defeat had to yield the supreme command to Kutusow until the death of the latter gave it to him again. At Moskwa he commanded the right wing; at Bautzen he commanded the entire army. He afterwards commanded the Russian army in Bohemia, and took part in the battles of Dresden, Kulm, and Leipzig. He was commander-in-chief of the Russian army in France, and in consequence of this was made a prince and a field-marshal. He died 14th May 1818, at Insternburg, on his way to the Bohemian baths. Two or three years before his death, the estate of Tolly or Towie-Barclay, in Aberdeenshire, the old inheritance of his family, was for sale, but he refused to buy it on the ground that his family had been so long expatriated that Scotland was now to them a strange country. Statues of him were erected at St Petersburg in 1837, and at Dorpat in 1846.

Bar-coch'ba, SIMON, the leader of the Jews in their great insurrection against the Romans, under the Emperor Hadrian, from 131-135 A.D. Three times had the oppressed Jews revolted without success, from 115 to 118; and in 130, soon after Hadrian's return from Syria, a new rebellion broke out, for which they had been secretly preparing. At the head of it was one Simon, who assumed the name of Bar-cochba—i.e. 'Son of the Star,' pretending that the prophecy was to be fulfilled in him, 'There shall come a Star out of Jacob' (Numb. xxiv. 17). He fought at first with great success against the Romans, and even obliged them to evacuate Jerusalem, where he was proclaimed king, and caused coins to be struck with his name. The war spread over all the country of Palestine,

and fifty towns, besides many villages and hamlets, came into the possession of the Jews. But on the arrival of Hadrian's general, Julius Severus, Jerusalem was retaken; and in August 135, Bether, the very last strong fortress held by the Jews, was stormed by the Romans. Bar-cochba fell on the day of this bloody conquest. Many thousands of Jews perished in this last attempt to regain political independence, and many were executed after its failure. From this last fatal struggle dates the final dispersion of the Jews over the face of the earth.

Bard, a fortress and village in the Italian province of Turin, situated on the left bank of the Dora Baltea, about 23 miles SE. of Aosta. When the French crossed the St Bernard in 1800, the fortress of Bard, manned by 400 Austrians, maintained for ten days a resistance to their further advance into Italy. Ultimately Napoleon contrived to elude the vigilance of the garrison, and passed by a mountain-track during the night. Bard was taken a short time after by the French, and razed, but in 1825 it was restored. Pop. about 450.

Bard, the name, known to the Romans since 200 B.C., by which the Gauls and other Celtic peoples (British, Welsh, Irish, and Scotch) designated their minstrels. Like the Scops of the Anglo-Saxons, and the Skalds of Scandinavia, the bards celebrated the deeds of gods and heroes at religious solemnities, and the festivities of princes and nobles, accompanying their recitations with the harp or Crwth (q.v.); they excited the armies to bravery, preceded them into the fight, and formed the heralds of princes and the mediators of peace. The institution early disappeared among the Gauls, but lingered long in Wales, Ireland, and Scotland. The bards formed a hereditary order, and exercised a decided national influence. The minstrels among the Celts, as among the Germans, were the organ of the people, and the channel of all historical tradition. It is supposed that in Wales, about 940 A.D., their privileges were defined and fixed by the laws which bear the name of King Howel Dha; and in 1078 the whole order is said to have been reformed and regulated anew by Gryffith ap Conan. At Caerwys, Aberfraw, and Mathraval, there were held from time to time great competitions in minstrelsy, called Eisteddfods (q.v.), at which the judges were appointed by the prince. When Wales was conquered by Edward I. (1284), the bards lost their privileges, and were, according to tradition, persecuted and put to death; but succeeding princes countenanced the institution, and Eisteddfods were repeatedly held under royal commission down to the reign of Elizabeth. See WELSH LANGUAGE AND LITERATURE.

In Ireland, the bards are believed to have been a hereditary guild, divided into three classes—the *Fíledha*, who sung in the service of religion and in war, and were the counsellors and heralds of princes; the *Breitheamhaim*, who recited or chanted the laws; the *Seanachaidhe*, who were chroniclers and genealogists to princes and nobles. Their ample privileges and endowments of land gave them an exorbitant influence, which both princes and people had sometimes to rise against and curb. The great skill of the Irish bards on the harp was acknowledged everywhere. After the conquest of Ireland by Henry II., the profession began to sink. Still many of the chiefs maintained bards in their families, whose songs and legends kept up the national feeling. This occasioned several measures of the English rulers against the Irish bards; Elizabeth ordered the bards that were captured to be hanged, as the instigators of rebellion. Turlough O'Carolan, born 1670, died 1737, is reckoned the

last Irish bard; his poems were translated into English by Furlory. Other lays of the bards have been translated by Miss Brooke, *Relics of Irish Poetry* (Dub. 1789), and Hardiman, *Irish Minstrelsy* (Dub. 1831).

The bardism of Scotland may be conjectured to have been similar to that of Ireland; but little is certainly known of the subject beyond the fact that there were poets or bards of different degrees in the Highlands down to the 17th century. In various Scottish enactments from 1449 onwards, bards were coupled with 'sorners' and 'masterful beggars,' as liable to hanging or burning on the cheek.

The name of bard was unknown among the Germanic nations; though a corrupt reading in some MSS. of the *Germania* of Tacitus (*barditus* for *baritus*, 'war-cry') led Klopstock and others to write wild religious and war songs, which they called 'bardeits,' under the notion that they were restoring a branch of the national literature.

Bardesanēs (properly, Bar-Daisan), a Syrian, the 'last of the Gnostics,' was born at Edessa in 154, and died in 222. He diffused his opinions through the medium of hymns, of which he is reckoned the earliest writer in Syria. These hymns, fragments of which are still extant, exhibit a rich and pure fancy. His *Gnosis* was not purely dualistic. He did not consider evil the eternal coefficient of good, but merely the result of a temporary reaction of matter on spirit. Yet, inexplicably enough, he maintained the devil to be a self-existent, independent being. He denied the doctrine of the resurrection of the body, and in conformity with such a conviction, asserted that Christ's body was not real, but only an illusive image brought down from heaven. See Hilgenfeld's *Bardesanēs* (1864).

Bardwan', or BURDWAN (but correctly Vardhamāna), a city of Bengal, on the East Indian Railway, 67 miles from Calcutta. In point of architecture, it is a miserable place—an aggregate, as it were, of 73 villages. It contains a palace of the Maharajahs, and a large collection of temples. Pop. (1881) 34,080.—The district of which the above city is the administrative headquarters, has an area of 2697 sq. m., and a pop. (1881) of 1,391,823 inhabitants. It exports silk, rice, tobacco, jute, also iron and coal—the latter chiefly brought from the mines of Raniganj. Since the opening of the East Indian Railway, many small villages have been transformed into thriving centres of trade. The division of Bardwan has an area of 13,855 sq. m., and a pop. (1881) of 7,393,954.

Barbone's Parliament, the 'Little Parliament' summoned by Oliver Cromwell, met 4th July 1653, and was so nicknamed from the name of one of its members, Praise-God Barbon or Barbone, a leather merchant. It consisted of 139 persons, 'faithful, fearing God, and hating covetousness,' but mostly of very destructive social principles. These began by abolishing the Court of Chancery, and were proceeding to abolish tithes, to the alarm of the more moderate members, and of Cromwell himself, who dissolved the parliament on 12th December of the same year.

Barèges, a small watering-place in France, in the department of Hautes-Pyrénées, about 12 miles SE. of Pierrefitte railway station. Situated at a height of over 4000 feet above the sea, great part of it is buried in snow throughout the winter, consequently few live here save in summer and autumn. The place consists of but one long dull street and about eighty houses, yet as many as 1200 bathers come here every year during the four months' season. The mineral water for which it is celebrated contains principally sulphuret of sodium, with portions of carbonate,

muriate, and sulphate of soda, nitrogen, and sulphuretted hydrogen. Its efficacy in the cure of wounds, rheumatism, stiffness of joints, and scrofulous complaints is said to be very remarkable. The French government has erected here two hospitals for soldiers.

Barèges, mixed tissues adapted for women's dresses, called in France *Crêpe de Barèges*, first manufactured at Luz, in the Pyrenean valley of Barèges, but now principally produced at Bagnères de Bigorre. Barèges are usually a mixture of silk and worsted; an inferior kind being composed of cotton and worsted. They vary in colour, and are sometimes light in tint, with printed patterns. All are of a slight fabric for summer wear.

Barègine, a slimy or gelatinous deposit in the hot sulphurous springs at Barèges, Aix-la-Chapelle, and elsewhere, which is found on microscopic examination to consist of masses of rods and filaments of *Beggiatoa* (see BACTERIA) mixed with grains of reduced sulphur. The thermal waters apparently act as culture-fluids for the atmospheric germs, and it is to the vital activities of these fungi that Cohn ascribes the evolution of sulphuretted hydrogen from the spring.

Bareilly, or BARELI, the chief city of a district in Rohilkhand, North-west Provinces of India, pleasantly situated in a well-wooded country on the Ramganga, 152 miles E. of Delhi. The city, civil station, and cantonments lie on an open plain, and show irregular outline and mean architecture, the private houses being mostly built of mud. Cotton, grain, and sugar are the staples of commerce; furniture and upholstery the manufactures. It is the seat of a college attended by more than 300 students. Bareilly was a centre of disaffection during the Mutiny, but was taken in May 1858. Pop. (1881) 109,844.—The district has an area of 1614 sq. m., contains (1881) 1,030,936 inhabitants, and is bounded on the N. by Tarai, and on the E. by Nepaul. (*Rai Bareilly* is a different town, district, and division in Oudh, near Lucknow).

Barentz (or BARENTS), WILLIAM, a Dutch navigator, who acted as pilot in connection with several expeditions which sailed from Holland in search of a North-east passage, and who died off the coast of Nova Zembla, 20th June 1597. The first vessel, fitted out by the city of Amsterdam, sailed from Holland, June 5, 1594, reached the north-east extremity of Nova Zembla, and returned. A second expedition of seven vessels, sent out in the following year, started too late in the season to be successful; the third expedition of two ships, starting in May 1596, reached Spitzbergen, when the two parted. Barentz's vessel, doubling the north-east of Nova Zembla, encountered ice, and unable to sail eastward, turned towards the south. Barentz and his crew were frozen up in Ice Haven on September 1st, where they spent a miserable winter. On 13th June 1597 the crew left these desolate shores in two boats, and Barentz died shortly afterwards. The survivors reached the shores of Lapland, and were rescued. Captain Carlsen found Barentz's winter-quarters undisturbed in 1871, after a lapse of 274 years, and in 1875 part of his journal was recovered by another explorer. The Barents Sea between the European mainland and Nova Zembla, Spitzbergen, and Franz-Josef Land, still preserves the name of this brave mariner. See Van Campen's *Barents' Relics* (Lond. 1877).

Barère de Vieuzac, BERTRAND, a French revolutionist and regicide, born at Tarbes, 10th September 1755. First an advocate at Toulouse, he acted as a deputy in the National Assembly, and was sent by the department of the Hautes-Pyré-

nées to the National Convention in 1792. He soon became active as a journalist, and attached himself to the 'Mountain,' supporting it with eloquence of such a flowery and poetical style as afterwards earned him the name of the 'Anacreon of the guillotine.' He was president of the Convention when the sentence was passed upon Louis XVI. He rejected the appeal to the people, and gave his vote with these words: 'The law is for death, and I am here only as the organ of the law.' Though a supporter of Robespierre, he concurred in his downfall, yet this did not save him from being impeached and sentenced to transportation. His sentence was not carried into effect, and he shared in the general amnesty of the 18th Brumaire. Elected a deputy during the Hundred Days, he was banished after the second restoration. He betook himself to Brussels, where he devoted himself to literary work till the revolution of July permitted his return. In the year 1832 he was once more elected as a deputy by the department of the Hautes-Pyrénées; his election, however, was annulled, on account of errors of form, whereupon the government called him to be a member of the administration of that department, which office he continued to hold till 1840. He died on 14th January 1841. His *Mémoires* were edited by Hipp. Carnot (4 vols. Paris, 1842). Barère was one of the most graceful and consummate liars in history. His masterpiece in this kind is his famous account of that glorious suicidal sinking of the ship *Vengeur* in 1794, which is still dear as a heroic story to the French people, and was described in glowing words, as a real historical exploit, by Carlyle in the first edition of his *French Revolution*. See Carlyle's *Miscellanies*.

Baretti, GIUSEPPE MARC ANTONIO, an Italian writer, born at Turin in 1719, was destined for the priesthood, but devoted himself to literature. In 1751 he established himself as a teacher of Italian in London, where in 1757 he published the *Italian Library*, giving an account of the most eminent Italian authors and their works. He afterwards spent nine years on the Continent, where he published a readable book of travels, and in Venice, under the name 'Aristarco Scannabue,' started the *Frusta Letteraria*, the 'literary scourge,' which was suppressed after the twenty-fifth number. In 1769 he stabbed a Haymarket bully in self-defence, and was tried for murder, but was acquitted—Dr Johnson, Burke, and Garrick testifying to the excellence of his character. He died in London, 5th May 1789. His thirty-six works included an Italian and English Dictionary (1760), which is still popular.—See Birkbeck Hill's edition of Boswell's *Johnson* (1887); and an article in the *Dictionary of National Biography* (1885).

Barfleur, a seaport town of France, in the department of La Manche, about 15 miles E. of Cherbourg. It is now a place of little importance, but it is noteworthy in history as the port whence, in 1066, William the Conqueror set out on his invasion of England. Pop. (1881) 1304. Close by, on the ill-famed *Pointe de Barfleur*, stands the highest lighthouse in France, 271 feet above the sea.

Barfrush. See BALFRUSH.

Bargain and Sale, in the law of England, is a mode of conveyance whereby property, real and personal, may be assigned or transferred for valuable consideration. In England the property of goods passes before delivery by such a sale, as opposed to the executory contract of sale where the passing of the property is postponed. The expression is chiefly important in connection with the conveyance of *real estate*. Such a bargain by the Statute of Frauds must be in *writing*.

No particular form of words is essential to the validity of a bargain and sale; 'bargain and sell' are the words of transfer ordinarily used. The pecuniary consideration is held to be a mere matter of form, and any trivial sum may be inserted in the conveyance. The effect of a bargain and sale not followed by a formal conveyance, was that the seller holds the legal estate for the benefit of the purchaser. The Statute of Uses transferred the legal estate to the purchaser in all such cases, and it thus became possible to convey the legal estate without making formal delivery of the land. To prevent secret conveyances in this form, the Statute of Enrolments enacted that a bargain and sale should not pass a freehold unless made by deed enrolled within six months after its date. Since the date of this statute, bargain and sale has not been used for conveying freeholds, but it is still a common form for conveying estates less than freehold, as a mortgage for a term of years, or the common lease and release. See LEASE AND RELEASE.

There is no such title to land or other real estate in the Scots law, but in that system there may be a contract as to land, the evidence of which must be in writing, as in holograph missives or tested minute of sale.

In the United States, bargain and sale is a contract to sell land for money or its equivalent, whereupon a use arises in favour of the bargainee to whom the seisin is transferred by force of the Statute of Uses; it is the most common form of conveyance of land in the United States. All things for the most part which may be transferred by deed, may be transferred by this mode of conveyance, and by it an estate in fee for life or for years may be created.

Barga Pass, a hill-pass in the north of Bashahr State, Punjab, leading across the Himalayas. It is the lowest of three passes within a mile's distance, and its highest part is about 15,000 feet above the sea.

Bargé, an ancient town of Piedmont, in the province of Cuneo, 30 miles SW. of Turin, with slate-quarries. Pop. 2074.

Barge, a name applied to vessels of various forms: (1) A pleasure-boat or boat of state, elegantly fitted, furnished with a band of rowers, used on state occasions. The college 'barges' at Oxford are similar boats, but are permanently moored. Such, too, are the 'house-boats' that have come so much into vogue on the Thames of recent years. (2) A flat-bottomed freight-boat, with or

Oxford University Barge.
(From a Photograph by Frith.)

without sails, used on our rivers and canals, either in conveying goods from one town or quay to another, or to aid in bringing stores to and from ships. Barges without sails are often called *lighters*. (3) A long narrow boat belonging to a man-of-war, for

the occasional use of the superior officers. (4) In the United States also, a double-decked passenger and freight vessel, without sails or power, and towed by a steamboat.

Barge-board, a board extending along the edge of the gable of a house to cover the rafters and

Barge-board.

keep out the rain. These barge-boards were often very richly ornamented, particularly in the 14th and 15th centuries.

Barham, RICHARD HARRIS, author of the *Ingoldsby Legends*, was born at Canterbury in 1788. In 1795 he succeeded to the manor of Tappington, and in 1802 he met with an almost fatal coach accident whilst on his way to St Paul's School, an accident that partially crippled his right arm for life. He entered Brasenose College, Oxford (1807), was ordained (1813), and in 1821 received a minor canonry of St Paul's Cathedral, three years later becoming incumbent of a City church, and priest in ordinary of the chapels royal. His first novel, *Baldwin* (1819), fell still-born; his second, *My Cousin Nicholas* (1834), appeared in *Blackwood's Magazine*; and with the commencement of *Bentley's Miscellany* in 1837, he began his series of inimitable burlesque metrical tales under the pen-name of Thomas Ingoldsby. They were first collected into a volume in 1840, and the third series was published in 1847 with a brief memoir of the author by his son. An English adaptation of the old French *contes*, the *Ingoldsby Legends* at once became popular from their droll humour, fine irony, varied and whimsical rhymes, and quaint out-of-the-way learning. His lyrics were published separately in 1881. Barham was a frequent contributor to the *Edinburgh Review* and *Literary Gazette*. He died in London, June 17, 1845. See his *Life and Letters* by his son (2 vols. 1870; 3d ed. 1880).

Bar-Hebræus. See ABULFARAJ.

Bari, a city of Italy, capital of an Italian province, is situated on a peninsula in the Adriatic, on the coast railway, 277 miles SE. of Ancona, and 122 NW. of Otranto. The streets of the old town only are confined and gloomy. Bari is the see of an archbishop, and has manufactures of cotton, silk, linen, and soap. Its quay and roadstead are good, and a brisk export trade is carried on. The massive old castle is of Norman origin. The old church, San Nicola, a noble specimen of the Lombard style of architecture, founded in 1087, contains some interesting monuments and relics. The still older cathedral of San Sabino has been ruined by the barbarous improvements it was subjected to in the last century. It contains pictures by Paul Veronese and Tintoretto.

47

Pop. (1862) 33,177; (1881) 58,266. Bari, the *Barium* of the Romans, was an important place to the Greeks as early as the 3d century B.C. It was made a *municipium* by Nero, was under the Saracens for some years in the 9th century, and was taken from the Greeks after a three years' siege by the Norman, Robert Guiscard, in 1071. Later it fell to the Pope, but revolted in 1228 to join the cause of the emperor, Frederick II. In 1558 it became part of the kingdom of Naples. — The province of Bari is badly watered, but wonderfully fertile, and produces fruit, wine, oil, and nuts in abundance. Its salt and nitre works are also important. Area, 2280 sq. m.; pop. (1881) 678,148.

Bari, a race of Soudanese negroes on both sides of the White Nile, whose chief town is Gondokoro. They are tall and active, cultivate durra, and keep numerous herds of cattle; but their morale has deteriorated sadly through the influence of slave and ivory traders, and they have become treacherous and bloodthirsty. In the summer of 1871 Baker waged a short war against the Bari, and added their country to the dominions of Egypt. The language of the Bari is nearly allied to that of the Dinka and other languages of the Nile. See Friedrich Müller, *Die Sprache der Bari* (Vienna, 1864).

Bariatinski, ALEXANDER IVANOVICH, PRINCE, a Russian field-marshal, born in 1814, and educated with the future czar, Alexander II. While a young officer in the hussars, some love-passages with a grand-duchess caused his transference to the Caucasus, where his successes against the famous Shamil (q.v.) secured him in 1852 the rank of lieutenant-general. On the accession of Alexander II., he returned to St Petersburg, and in 1856 was appointed to the command of the army of the Caucasus. Three successful campaigns were closed by the storming of Glunib, and the capture of Shamil. For these services he was made a field-marshal. His health, however, had broken down, and the remainder of his life was passed chiefly abroad. He died in Geneva, March 9, 1879.

Barilla, an impure carbonate of soda, procured from plants which grow in salt-marshes or other places near the sea; it forms a considerable article of commerce, being used in the manufacture of soap and of glass, and for other purposes in the arts. The greatest quantities of barilla are produced in Spain and the Balearic Islands; but the Canary Islands, Italy, and France also contribute a part. It is procured by burning the plants, much in the same way that seaweeds once were largely burned on the coasts of Scotland for kelp. The Spanish barilla is most esteemed, especially that produced near Alicante, where it is chiefly obtained from the *Salsola sativa*, a plant of the natural order Chenopodiaceæ. This plant is cultivated in grounds close by the sea, embanked on the side nearest it, and furnished with floodgates, through which the salt water is occasionally admitted. It is cut in September, dried in small heaps, and then burned in a hole in the ground. Other species of *Salsola* (Salt-wort), as *S. tragus* and *S. kali* (the latter, a common native of the shores of Britain), are also burned for barilla, although they yield it in smaller quantity than *S. sativa*. Barilla is made in France from *Salicornia herbacea* or *annua* (Glass-wort), another of the Chenopodiaceæ, plentiful also in salt-marshes on the shores of Britain and other parts of Europe. The manufacture of barilla has greatly declined, from the fact that soda can now be made artificially from common salt. See SALT-WORT.

Baring. The firm of Baring Brothers & Co. is one of the greatest financial and commercial houses in the world. The father of its founder was

John Baring, a German cloth manufacturer, who started a small business at Larkbear, near Exeter, England, in the first half of the 18th century. Two of his sons, Francis and John (1730-1816), established in London in 1770 the now existing house.

SIR FRANCIS (1740-1810), born at Larkbear, was deaf from his youth; but receiving a commercial training in the house of Boehm, he overcame all obstacles, and founded a large and successful business. He became a director of the East India Company, and being a staunch supporter of Pitt, was created a baronet by that minister in 1793. He represented Grampound, Chipping Wycombe, and Calne in parliament from 1784 to 1806. He took an active part in the discussions relative to the Bank Restriction Act of 1797, and wrote on this and other financial subjects. At the time of his death he was reckoned the first merchant in Europe, and had amassed a fortune of nearly seven millions.

SIR THOMAS BARING (1772-1848), eldest son of the above, succeeded his father in the baronetcy. He appears to have taken no active part in the business of the firm, being chiefly remarkable as an admirer and encourager of art. His magnificent collection of paintings was dispersed by public sale after his death in April 1848. His fourth son, Charles Thomas (1807-79), Bishop of Durham, was a strong Evangelical, noted for his piety and personal kindness. His name is honourably associated with the work of church extension in his diocese.

ALEXANDER BARING, brother of the above (see ASHBURTON, LORD).

SIR FRANCIS THORNHILL BARING (1796-1866), son of Sir Thomas, whom he succeeded, was educated at Oxford, where in 1817 he took a double first class. He represented Portsmouth from 1826 till 1865. Under successive Whig governments, he was a Lord of the Treasury, Secretary to the Treasury, Chancellor of the Exchequer, and First Lord of the Admiralty. He was more noted for his business aptitude than as a politician. He was created Baron Northbrook in 1866, and died at Stratton Park the same year. His son, Thomas George Baring, the second Lord Northbrook, was born in 1826, and was successively a Lord of the Admiralty, Under-secretary of State for India, Under-secretary of War, Governor-general of India (1872-76), and First Lord of the Admiralty (1880-85).

THOMAS BARING (1799-1873), brother of the first Lord Northbrook, devoted himself early to commercial pursuits, and also to politics, in which he was a Conservative, thus taking the opposite side to his brother. He entered parliament in 1836, represented the borough of Huntingdon from 1844 till his death, and was offered the Chancellorship of the Exchequer, under Lord Derby in 1862 and 1868. Like the first Lord Ashburton, he had a taste for pictures. He was much more widely known as a partner of the firm of Baring Brothers than as a politician.

In 1885 the then head of the firm, Edward Charles Baring, was raised to the peerage as Baron Revelstoke. The firm is engaged to a large extent in the negotiation of national loans, in exchange and money-broking, in the produce-trade, home and colonial, and in importation and exportation. In 1890 the firm just tided over a severe crisis.

Baring-Gould, SABINE, an active litterateur in widely different fields, was born at Exeter in 1834, of an old Devonshire family. In early life he lived much in Germany and France. Educated at Clare College, Cambridge, he was appointed incumbent of Dalton, Thirsk, in 1869; rector of East Mersea, Colchester, in 1871; and in 1881, rector of Lew Trenchard, Devonshire, having also on the death of his father succeeded to the family property there

in 1872. He travelled in Iceland in 1861, and published the results in *Iceland: its Scenes and Sagas* (1862). His most important books are those for which he has drawn upon his wide knowledge of out-of-the-way medieval lore: *The Book of Werewolves* (1865), *Post-medieval Preachers* (1865), *Curious Myths of the Middle Ages* (1866-67), *The Silver Store* (1868), *Curiosities of Olden Times* (1869), and *Legends of Old Testament Characters* (1871). He has written several volumes on Germany, both historical and descriptive, and has made numerous contributions to theological learning, the chief being *The Origin and Development of Religious Belief* (1869-70), a work less lucid than learned; *Lives of the Saints* (15 vols. 1872-77), *Some Modern Difficulties* (1874); *The Lost and Hostile Gospels* (1874); as well as several volumes of practical and pointed sermons, of which perhaps the best are *Village Sermons for a Year* (1875); *The Preacher's Pocket* (1880); *The Seven Last Words* (1884); and *The Trials of Jesus* (1886). One of his most interesting books is his account of Robert S. Hawker, *The Vicar of Morwenstow* (1876). He published a novel, *In Exitu Israel*, without much success, in 1870; but of late years he has won celebrity with a series of novels, of which the authorship is an open secret. The earliest, *Mekalah* (1880), is a story of uncommon power—indeed one of the strongest novels of its time—but it is unequal and somewhat extravagant; its successors are *John Herring*, *Court Royal*, *The Gaverocka*, and *Richard Cable*, all stories of no common merit, and the last by some deemed superior even to *Mekalah*.

Baringo, an African lake lying NE. of the Victoria Nyanza, and half a degree N. of the equator. It is about 20 miles long, lies 3000 feet above the sea, has numerous streams flowing into it, but has no outlet, though its water is fresh. The mountain-scenery around it is striking and very beautiful. It was visited by Mr Joseph Thomson in 1883.

Barita, a genus of large Australian birds, more accurately known by the title *Gymnorhina*, and more popularly as *Piping Crows*. The beak is large, conical, and straight, and its dilated base arches over the forehead. The common *Barita* (*Gymnorhina tibicen*) occurs in small communities, especially in cleared places, and often near the colonist settlements. It feeds principally on insects, but is said also to devour small birds. Its note is melodious, and the bird can be readily tamed and taught.

Baritone, that species of the human voice which lies between the bass and the tenor, but whose tone-character is more allied to the bass. The compass of a baritone voice is from A on the first space of the bass clef to F above the staff; but the principal notes of the voice are from C to E within that compass; and these should possess the energetic character of a bass voice, and, above all, be produced from the chest, excepting perhaps the highest. In former times, the music for this species of voice was written on a staff with the F clef placed on the third line, thus: . The name baritone is also

given to a small saxhorn in B \flat or C (see SAXHORN).

Barium (sym. Ba, eq. 137) is the metal present in heavy spar (sulphate of baryta) and baryta. It was regarded as a white metal, until the researches of Dr Matthiessen demonstrated that it possesses a yellow colour. As yet, the metal barium has not been obtained in mass, but only as a powder. It decomposes water readily at ordinary temperatures, and exposed to the air, quickly combines with oxygen, forming the oxide of barium, BaO, or Baryta (q.v.), an earth resembling ordinary caustic lime. The sulphide of barium, BaS, is obtained when the

sulphate of baryta, BaSO_4 , in powder is mixed with finely pulverised coal, and the whole being placed in a crucible, is raised to a red-heat in a furnace. The result is, that 4 atoms of the carbon, C, of the coal carry off the 4 atoms of oxygen in the sulphate of baryta as carbonic oxide, CO, whilst the barium united solely with sulphur is left behind as the sulphide of barium, BaS. The *chloride of barium* is prepared by adding hydrochloric acid, HCl, to a solution of the sulphide of barium, BaS, when sulphuretted hydrogen, H_2S , escapes, and chloride of barium remains behind, and on evaporation of the liquid, is obtained in crystals.

Bark. See BARQUE.

Bark. The hard outer covering of any stem is often popularly called bark, or by botanical writers, cortex. But since in ferns this may be merely a thickening of the outer layers of the cellular envelope, into which the fibro-vascular bundles do not enter, while in monocotyledons the protective layer is not merely a hardening of the epidermis and cellular envelope, but may be firmly interwoven by the fibro-vascular bundles, and in fact indistinguishable from the inner portion of the stem, save as a region so to speak mechanically differentiated by exposure, botanists are accustomed to restrict the term bark to the outer portion of the dicotyledonous stem (see DICOTYLEDON), and especially to that of woody

Fig 1.—A, Longitudinal section of bark of Dicotyledon (Alder):

B, The same in transverse section.

and perennial stems. In succulent and herbaceous plants, and young shoots of shrubby or herbaceous ones, the stem structure resembles that of lower plants; the epidermis (which may be sooner or later for practical purposes supplemented or replaced by a subjacent layer of cork) protects the green parenchymatous layer, or *cellular envelope*, which performs leaf functions, and is, in fact, continued upwards through the leaf-stalks into the parenchyma of the leaves. Below this layer we come to the fibro-vascular bundles, which lie simply in a loose but anastomosing ring, or rather cylinder, through the meshes of which the external cellular envelope and the internal pith are in direct continuity. When, however, the dicotyledonous stem becomes perennial, its fibro-vascular bundles continue to grow through the combined multiplication of a central layer of persistently

embryonic cells, the so-called *cambium*; the new cells next the inner or woody portion of the bundle develop into a second layer of wood outside the first; in the same way, the new cells next the outer or bast portion of the bundle form a new layer of bast, of course lying within the first (see BAST), and this process being repeated every spring, as many layers of wood and bast tend to be formed. The formation of bast is, however, usually less regular than that of the wood. This growth of the fibro-vascular bundles limits the outer portion of the cellular matrix, or cellular envelope, from the internal portion or pith much more sharply than before; yet the cellular continuity is still kept up, although the intermediate cells become compressed and elongated into radiating plates, the *medullary rays*. And since the cambium elements of the bundles unite to form a continuous cylindrical layer, it is evident that it is in this region of excessively delicate and thin-walled protoplasmic cells that any mechanical force applied to the stem will cause rupture. Unlike the fibro-vascular bundles of ferns, monocotyledons, or even herbaceous dicotyledons, the bast and wood of the fibro-vascular bundles of the perennial dicotyledonous stem are thus readily split asunder; the woody layers inclosing the pith are thus left exposed, while the bast layers of the bundles, with, of course, their external coverings of cellular envelope, cork, and epidermis, are thus peeled off as a hollow cylinder, while the torn cambium covers both separated surfaces with its wet and viscous remnants. Botanists were formerly wont to regard this mechanically or accidentally separated 'bark' as a distinct structure or organ highly characteristic of dicotyledons, and to distinguish its layers as parts of a natural whole, the epidermis and cork, the cellular envelope, and the bast being respectively termed outer, middle, and inner bark, or epi-, meso-, and endophloem; but these useless and confusing terms are now happily abandoned by careful writers, since they are no more of physiological than of morphological importance. The functions of the different layers of bark are, of course, as entirely distinct as is their origin; the protective function of the epidermis, even with its cuticle, being insufficient, this is supplemented by the corky layer, which grows continuously from a layer of permanently embryonic cells, the cork cambium (see CORK). The cellular envelope continues to vegetate, more or less actively, so long as any light finds its way through the cork layer, air too finding access through loosened openings of this, the lenticels; while the functions of the bast are more complex, and are separately discussed (see BAST). The tannin and other important principles to which bark so often owes its economic importance, are usually to be regarded from the standpoint of vegetable physiology not as reserve materials, but rather as waste products of the plant's activities, which are either contained in the laticiferous vessels, or deposited in the cellular

Fig 2.—Stem of Laburnum, showing the layers of the bark:

envelope and in the cells of the soft bast by the descending sap. The outer layers of thick barks usually crack as the stem expands within; but in the lace-bark tree of the West Indies (*Lagetta linearia*) the bast fibres separate regularly, and layer after layer may thus be stripped off, showing lozenge-shaped meshes arranged with beautiful regularity.

Bark for Tanning.—The bark of many trees is capable of being used for Tanning (q.v.), but those kinds are usually preferred which are rich in tannin (see TANNIC ACID), although other properties besides the percentage of tannin determine the value of a bark for preparing leather. Oak bark from *Quercus robur* and *pedunculata* are used more than all other kinds in Europe, and contain from 7 to 11 per cent. of tannin; but the barks of willow, larch, Scotch fir, birch, and alder are likewise employed to a considerable extent. That of the Chestnut (*Castanea vesca*) is much esteemed. From both bark and wood of this tree an extract is made in France which is largely used both in tanning and dyeing. In Spain, tanners employ the inner layer of the bark of the cork oak. Three species of oak are used for tanning in the United States—namely, *Quercus tinctoria*, *prinus*, and *falcata*; the former two contain about 6 per cent., and the last 8.6 per cent. of tannin. West of the Rocky Mountains, the bark of the *Quercus densiflora*, which contains 16.5 per cent. of tannin, is preferred. But the bark most used for tanning, both in the States and in Canada, is that of the Hemlock Spruce (*Abies Canadensis*). It contains from 14 to 16 per cent. of tannin. This bark has become so much used for tanning, and its extract for both dyeing and tanning, that the annual production of it in the United States has reached the enormous amount of 1,100,000 tons, while the quantity of oak bark used does not exceed 355,000 tons. Hemlock bark is largely exported from America. The *Acacia decurrens*, a tree indigenous to Australia and Tasmania, yields a bark very rich in tannin, and it has been much used in England. The bark of the *Loxopterygium Lorentzii*, from the Argentine Republic, contains 20 per cent. of tannin, and is very popular as a tanning material in France. Some of the above barks are transported in the form of extracts.

The *barking* of trees can be accomplished with facility only in spring, when the sap has begun to circulate. The tree being felled, the rough external lifeless parts of the bark are removed as useless by means of a sharp instrument called a *scraper*; the smaller branches are cut into lengths of about two feet, and their bark is loosened by beating with a mallet, and easily taken off—as boys at the same season make plane-tree whistles; the bark of the trunk and main branches is cut through by a chisel-like instrument, called a *barking-iron*, into similar lengths, each of which is divided longitudinally, and finally stripped off by the aid of mallets, chisels, &c. The bark is sometimes dried in sheds, being placed on narrow shelves or frames in such a way that there may be a very free circulation of air about it; sometimes in the open air, when it is very generally made to rest in a sloping position against trunks of trees placed horizontally at a little distance from the ground, or against racks formed of forked sticks with cross-bars. The larger pieces of bark are placed so as to protect the smaller both from sun and rain. Great care is necessary in the drying of bark, as it is much spoiled if allowed to get mouldy, and is liable to suffer injury from rain or from the exposure of its inner surface to the sun. Bark was, and to some extent still is, a very important source of the revenue derived from many woods and coppices; but in numerous dis-

tricts of Great Britain, oak and other coppice-wood is no longer a profitable forest crop, owing to the low price to which bark has fallen.

Uses of Bark by Savage Races.—In the ethnographical collections of many museums will be found some curious applications of bark. Some tribes of North American Indians make their canoes of birch bark, and in British Guiana they are made of the bark of Purple Heart (*Copaifera pubiflora*) and of Locust (*Hymenaea Courbaril*). Of birch bark, the Red Indians also construct baskets, cans, &c. In Sweden it is used as a material for carved boxes, and in Lapland for baskets and shoes. Coats are made in British Columbia from pine bark, and this garment is formed of an elm bark by the Ainos of Japan. In both cases the bark is woven in strips. Some aboriginal races make blankets and various articles of clothing of prepared bark from different trees, which in some cases is thick and woolly, and in others thin and papery. A kind of lace is obtained from the Lace-bark (q.v.) of Jamaica. Paper is made in different parts of the world from the bark of a number of species of trees, but some kinds are used quite locally (see PAPER). At least one aboriginal tribe in Australia form their shields of bark. Bread of birch bark is eaten in North-west America; and in Norway and Lapland, in times of scarcity, of that of elm and pine. One of the most primitive cooking-vessels known is made of bark, and is used by the Shompengs inhabiting the interior of the Great Nicobar.

Bark in Medicine, &c.—The principal barks used in medicine will be found noticed in separate articles. Amongst them may be noted Angostura Bark (*Cusparia*); Cascarilla (*Cascarilla* Bark, *Eleutheria* Bark); Cascara (*Sagrada* Bark, *Sacred* Bark, *California* Buckthorn Bark); Cinchona (*Cinchona* Bark, *Peruvian* Bark, *Jesuits' Bark*, *China* Bark, *Arica* Bark, *Calasaya* Bark, *Crown* Bark, *Condaminea* Bark, *Loxa* Bark, *Ledger* Bark, *Red* Bark, *Quill* Bark, &c.); Cinnamon Bark; Winter's Bark; Witch Hazel (*Hamamelis*); Bebeerine.—When bark is mentioned without any prefix, it is usually Cinchona, otherwise called *Peruvian* or *Jesuits' Bark*, that is intended.

The barks used for dyeing, tanning, and other purposes in the arts, being generally named from the trees which produce them, particular references here are unnecessary.

Bark-beetles, a name loosely applied to a number of Coleoptera which devour the bark of trees. Some of them are members of a family known to entomologists as Xylophaga, or wood-eaters. Many beetles eat wood and such substances, but the forms in question are of special

Fig. 1.—Galleries made in Pine-bark by parent (horizontal) and larvæ (vertical) of *Tomiscus typographus*.

importance as forest pests. The adults are not content, like so many other beetles, with finding underneath the loose bark of trees a safe nursery for their larvæ, but bore passages, whence

the larvæ again bore outwards, so doing great damage. Thus the Typographer Beetle (*Tomicus typographus*) bores, pairs, and breeds in the bark of pine-trees, and the larvæ, laid in side recesses, eat their way out laterally, leaving their mark in the form of the curious galleries described by the title 'typographus.' In 1783 this beetle is said to have ravaged the Harz Forest in Germany to the extent of a million and a half of pines, and so revived its popular name of 'the Turk,' by which it is referred to in some old German liturgies. Another Pine-beetle (*Hylurgus pini-perda*) is also a formidable devastator. The maggots develop in recesses from the main tunnel, bore their way through the bark, fly to other trees, and eat into the tender shoots. It is this last habit which is obviously most injurious. The tender bark of the young shoots of the Scotch fir, spruce, larch, &c. is the favourite food of the Pine-weevil (*Hylobius abietis*), while the maggots form winding galleries in the soft wood under the bark. The Ash-bark Beetle (*Hylesinus fraxini*) is a frequent pest in plantations where thinning and removal of sickly branches is insufficiently attended to. Another common form is the Elm-bark Beetle (*Scolytus destructor*). The female makes a burrow about 3-5 inches long, and lays a hundred or more eggs.

Fig. 2.

a, Galleries made by Elm-bark Beetle (*Scolytus destructor*);
b, the insect, magnified; c, natural size.

The restless grubs bore outwards as usual at right angles to the parent gallery. As a curative device, the outer bark of elms is sometimes removed, with the result of causing a vigorous flow of sap, which in some way or other kills the maggots. For further information as to these frequent and formidable pests, which are of no little practical importance, Miss Ormerod's work on *Injurious Insects* may be consulted. The same work gives an account of some of the necessary precautions of thinning, cleaning, &c., as well as of the curative processes of washing, scraping, and the like. See BEETLE.

Barker, EDMUND HENRY, classical scholar, was born in 1788 at Hollym, Yorkshire, and studied at Cambridge. He prepared editions of several Latin classics, a translation of Buttman's *Greek Grammar*, and numerous contributions to periodicals, particularly to the *Classical Journal*; and during a five years' residence with Dr Parr, he was led to undertake a revision of Stephens' *Thesaurus Linguae Graecae* (12 vols. folio, 1826). This gigantic work was violently assailed in the *Quarterly Review* by Blomfield, against whom Barker wrote his *Aristarchus Anti-Blomfieldianus* (1818). Barker's *Parriana* (2 vols. 1828-29), and his posthumous *Reminiscences of Professor Porson* (2 vols. 1852), give much information about those two famous scholars, but are ill-digested and not entirely reliable. He lost all that he had in a lawsuit, was obliged to sell his fine library, and was thrown

into a debtors' prison. He died in London, March 21, 1839, in extreme poverty.

Barker's Mill (Fr. *Roue à réaction*, Ger. *Segner's Wasserrad*), a water-wheel invented by a Dr Barker towards the middle of the 18th century.

Fig. 1.

It is represented in its simplest or typical form in fig. 1. A is a wide metal pipe, resting at its lower end, by the steel spindle T, on a metal block B, and kept in a vertical position by the spindle S, at its upper end, which passes through the frame of the machine. Near its lower end, two smaller pipes or arms C, C, are inserted, which project horizontally from it, and these have each, at the outer extremity, a hole cut horizontally in them, opening towards opposite sides. The water is supplied by the pipe P. The reaction caused by the water gushing from the arms, forces them backwards, and gives to the whole machine a rotatory motion. Suppose that the arms were closed all round, the pressure of the water against the sides would be proportional to the height of the water in the pipe A, and the pressure against any particular surface of the side would produce no motion of the arm, because an equal pressure is exerted in a contrary direction upon a corresponding surface opposite to it. Now, if one of these surfaces be cut out, the pressure against the other being uncounteracted, forces the arm in the opposite direction to that of the side in which the hole is made. This being done to both arms on opposite sides, two equal pressures are produced, which conspire in generating the same motion of rotation. As soon as motion ensues, centrifugal force comes into play, which, throwing the water out towards the ends of the arms, increases the rapidity of its discharge, and therefore increases the reaction.

The power is manifestly increased by heightening the water-column, or by lengthening the arms—the former increasing the pressure of the water, and the latter increasing the leverage. In the mill shown in the figure, the column in A cannot be advantageously heightened, for the higher it rises, the greater must be the weight which the conical spindle, T, has to sustain, and the greater, consequently, becomes the friction. Hence, in the reaction-wheels now in use, the

Fig. 2.

original Barker's Mill has been so modified as to allow of the water being conducted from the reservoir below the arms instead of above. The power of these machines may be also increased by using curved (fig. 2) instead of straight arms. See WATER-POWER.

Barking, an irregular straggling market-town of Essex, on the left bank of the Roding, 7 miles N.E. of London. It has a fine old church, but scarce any remains of its ancient abbey (founded 670), once one of the richest and most important Benedictine convents in the kingdom. It was burnt by the Danes in 870, but was splendidly rebuilt about the middle of the 10th century by King Edgar. The Abbess of Barking was one of four ladies who held the rank of baroness in right of their office. Market-gardening, the manufacture of jute, and fishing give employment to the inhabitants, (1881) 9203 in number. A flotilla of fishing-smacks belongs to the town, their harbour being Barking Creek, at the mouth of the river. Near this point the sewage of the Metropolitan Board of Works empties into the Thames.

Barlaam and Josaphat, one of the most widely-spread religious romances of the middle ages, relating the conversion of the Indian prince Josaphat by the hermit Barlaam, his subsequent resistance of all forms of temptation, and his becoming a hermit. The story, however, has been discovered to be nothing more or less than a Christianised version of the legendary history of Buddha, agreeing with it in all essentials and many details. The very name Josaphat is merely the Buddha under another name, the word *Josaphat* or *Josaphat* being simply a corruption of the word *Bodhisat*. Rhys Davids notes that Josaphat is in Arabic written also *Yūdasaf*; and this, through a confusion between the Arabic letters Y and B, is for *Bodhisatva*, a title of the future Buddha which is constantly repeated in the Buddhist Birth Stories. The Buddhist origin of the romance was first pointed out by Laboulaye in 1859, but was first proved by Dr Felix Liebrecht in 1860. The celebrated theological writer, John of Damascus, who flourished in the 8th century at the court of the calif of Bagdad, and afterwards became a monk, is regarded by many scholars (such as Max Müller, Gaston Paris, and Rhys Davids) as the author or rather translator of the original Greek text, which was first published by M. de Boissonade in the 4th volume of his *Anecdota* (Paris, 1832). M. Zotenberg, in his edition of a French version, published in collaboration with M. Paul Meyer in 1864, expressed the opinion, adopted also by Littré, that the work had probably been composed in Egypt, and that it was anterior to Islamism; but M. Zotenberg has since made out a strong case to prove that the Greek text was edited in Syria in the first half of the 7th century by a monk named John, belonging to the convent of Saint Saba, that it contains traces of the religious controversies peculiar to that time, and that this version has been the source of all the translations and known imitations. Whatever its ultimate origin, this romance quickly became popular, and was translated into many European languages. It exists in Latin, French, Italian, Spanish, German, English, Swedish, and Dutch versions, and was even translated as early as 1204 into Icelandic. In the official *Martyrologium* drawn up by Cardinal Baronius for use in the Western Church, and authorised by Pope Sixtus V. (1585-90), appear, under the date of the 27th of November, 'the holy saints Barlaam and Josaphat of India, on the borders of Persia, whose wonderful acts St John of Damascus has described.' It is impossible to discover at what

precise date their canonisation was first decreed, but they appear in the *Catalogus Sanctorum* of Petrus de Natalibus, who was Bishop of Equilium from 1370 to 1400, and it was from this source that Cardinal Baronius adopted their names into his authorised Martyrology. The name of 'the holy Josaph, son of Abenér, king of India,' appears in the corresponding manual of worship in use in the Greek Church under date of August 28. Professor Max Müller points out that Gotama the Buddha, under the name of St Josaphat, is at the present day officially recognised and honoured throughout Catholic Christendom as a saint of the Church of Christ, and adds that 'few saints have a better claim to the title than Buddha; and no one either in the Greek or in the Roman Church need be ashamed of having paid to Buddha's memory the honour that was intended for St Josaphat, the prince, the hermit, and the saint.' See 'Die Quellen des Barlaam und Josaphat,' in Felix Liebrecht's *Zur Volkskunde* (1879); Max Müller, 'On the Migration of Fables,' in vol. iii. of *Chips from a German Workshop* (1880); *Buddhist Birth Stories*, by Rhys Davids (1880); *Notice sur le Livre de Barlaam et Josaphat, accompagnée d'extraits du texte Grec et des versions Arabe et Éthiopienne*, by H. Zotenberg (1886); and J. Haléys article thereon in vol. xv. of the *Revue de l'Histoire des Religions* (Jan.-Feb. 1887).

Bar-le-Duc, capital of the French department of Meuse, situated on the river Ornain and the Marne-Rhine canal, 158 miles E. of Paris by rail. It manufactures cotton and calicoes, and carries on a considerable trade in timber from the Vosges, for the use of Paris, and in iron, wool, and wine. Bar-le-Duc has a communal college, normal school, theatre, museum, and public library. Its ruined castle, long the stronghold of the Dukes of Bar (Le Barrois), still overlooks the entrance into Lorraine. Pop. (1881) 17,421.

Barletta, a seaport of Italy, on the Adriatic, 34 miles N.W. of Bari by rail. It carries on a large shipping-trade with Greece, the Ionian Islands, and other ports of the Adriatic. The town is well built, handsome, and clean; it has a fine cathedral, a colossal statue supposed to represent the Emperor Heraclius, a college, theatre, and castle, formerly one of the most impregnable fortresses in Italy. Pop. (1881) 31,904.

Barley (*Hordeum*), a cereal or grass crop. In ordinary cultivation it is annual, but some hardy varieties are sown in autumn, and except in severe winters, survive and ripen the second year, or if frequently cut green and not allowed to mature seed, may continue to grow for several years. The cultivation of it extends from Italy northwards in Europe. It is better adapted than any other grain to the most northern regions of the grain-growing belt. Some of its varieties are cultivated with advantage where the climate is too cold, or the summer too short, for any other cereal crop. It extends over a wider climatic range than any of the other grains. Barley-meal is used for bread in the north of Europe, but in other parts it is used as a horse-corn, or converted into malt for the making of beer, or deprived of its outer husky covering, and so used as an article of human food called *pot-barley*, or when well rounded and polished in the mill, *pearl-barley*: this is sometimes ground into a fine quality of barley-meal.

By botanists cultivated barley in England is divided into three species. *H. vulgare* (Scotch Bere or Bigg) is distinguished by having the grains in four rows; *H. hexastichum* in six rows; and *H. distichum* in two rows. But the lower part of the spike in the varieties ranked under *H. vulgare*

is often six-rowed, and only the upper part four-rowed; and in rich soils, a tendency to resume the six-rowed form is otherwise manifest. A kind with naked seeds, called *Siberian Barley* (*H. caeleste*

Barley :

a, a spike in fruit; b, a cluster of three spikelets in flower, with awns removed; c, a flower with palea; d, a grain (outer side).

of some writers), is cultivated in some parts of Europe, but it is liable to loss in harvest through the grain, which is slightly attached to the straw, shaking off; its straw is regarded as richer food for cattle than that of most other kinds. The *Nepaul* or *Himalaya Barley*, another variety with naked seeds, has been recommended as particularly adapted for cold mountainous regions, yielding good crops in the Himalaya at an elevation of 14,000 feet above the sea.—Of the two-rowed barley there are many varieties, of which the Common or *Early English*, *Golden Drop*, *Big Ben*, *Hallett's Pedigree*, and the *Chevalier* are among the most esteemed, the latter being in particular demand for brewing. The *Sprat* or *Battle-dore Barley* (*H. zeocriton*) is also two-rowed, but is distinguished by the grains standing out from the spike, their awns spreading very widely. It is sometimes called *German Rice*, as it swells by boiling in the way that rice does, and for some purposes forms a good substitute for it. It is scarcely cultivated in Britain, but is in much esteem in Germany, and succeeds well in the Alps at an elevation of 3360 feet.

H. pratense and *H. murinum* are barley grasses seen in natural British pastures, but are of no practical value.

Barley is most productive where the climate is moderately dry and warm. No country seems to possess a soil and climate better suited to its growth than many parts of Britain. In former times, this grain was largely employed in the British Islands as human food; and is still used in some parts of Ireland, and in the Highlands of Scotland. Fine malting barley always commands a ready demand in the London market, as well as a high price.

Barley occupies a prominent place in the rotation of the lighter class of arable lands, such as in Suffolk and Norfolk. Fine malting qualities are grown on the turnip-soils of these counties, as well as throughout the south-eastern counties, where the four-course rotation is adopted. In this rotation, the barley follows the turnip-crop. The

ground is worked into a fine tilling condition on the surface, and the seed is either broadcast or drilled in February or March, depending on the weather and the condition of the soil, at the rate of two, three, or four bushels to the acre. On strong land or on very rich soils, the barley-crop is sown after a grain crop, say wheat, as it is found to give a better quality, though not such a heavy crop. In the south of England, barley is allowed to stand till the grain is fully ripe, when it is either cut with the scythe or most commonly now with the reaping-machine. In some parts, where the straw is very short and the bulk small, it is not bound up into sheaves, but remains in the swath for a few days, when it is afterwards carted, and stored in barns or oblong stacks. The produce is more influenced by the seasons than that of wheat, as it is liable to suffer from droughts in the early part of the year, and when sown late in very dry seasons, it sometimes remains for weeks and months without germinating, and never comes to a crop. This is all the more striking when it is remembered that if sown under favourable conditions, barley germinates more quickly than any other grain crop, being up within three or four days. On well-farmed land, from 48 to 60 bushels and upwards are got to the acre. In the peaty soils of the fens of Lincolnshire, barley is not raised, as it is too liable to lodge with the rain; neither is it a favourite crop in the moist climate of the west of England.

Barley has long been grown in Scotland. The level parts of the Lothians and other counties in the east of Scotland, with Moray, Inverness, and Ross in the north, are the districts in which the finest crops are raised. In these districts barley is commonly sown after a portion only of the turnip-break. Morayshire barley has long been famous for its fine sample, and is in great demand with English brewers. On the other hand, in the less genial climate of the western counties, and also of the upper parts of Aberdeenshire, Banffshire, and Perthshire, less barley is sown, and oats frequently succeed the green-crops. In these parts the variety known as *bere*, or *bigg*, is preferred to any other, as it is not so liable to lodge, and it withstands wet weather better, and comes earlier to maturity. *Bere* is the variety which is cultivated by many of the small cotters in the Highlands and islands. Instead of a rotation in which green-crops find a place, a succession of corn-crops is taken, and an occasional rest is given to the soil. The crop, when ripe, is cut by sickle, scythe, or reaping-machine; bound up at once, and put into stooks, to defend it from the weather till ready to cart, and to be built up in neat round stacks. The grain is invariably thrashed out by machinery.

On good turnip-soils the land is enriched by the droppings of the sheep, frequently fed on cake and corn along with the roots, and manure is not often directly applied to the barley-crop. When the turnip-crop is drawn from the land, unless the soil is very rich, the barley should have a dressing of some phosphatic manure, say 3 cwt. or 4 cwt. per acre of superphosphate bone-meal, or fish-guano, at the time of sowing, and 1 cwt. of nitrate of soda after the plant is well up, and the roots spreading through the soil.

Barley-break, an old English country game, originally played by three couples, resembling *Prisoner's Bars*. One couple, left in a middle den called 'hell,' had to catch the others, who could *break* or separate when about to be overtaken. They then changed partners, but when caught, had to take their turn in catching the others. The game is alluded to by Sir Philip Sidney, Suckling, and Herrick. The first half of the name may be from the grain, *barley*, because often played in a

corn-field or barley-field, or it may be *barley* or *parley* (Fr. *parlez*), a common children's term for a truce during a game.

Barleycorn, JOHN, a personification of the spirit of barley, or malt-liquor, often used jocularly, and in humorous verse. This usage is comparatively ancient. Dr Murray's Dictionary quotes a title in the Pepysian Library, about 1620, 'A pleasant new ballad . . . of the bloody murder of Sir John Barleycorn.' Burns's ballad on John Barleycorn, 'There was Three Kings into the East,' is well known, and more popular than the verse deserves.

Barley-sugar, a confection prepared with sugar and a decoction of barley.

Barlow, JOEL, an American poet and politician, born in 1755 at Reading in Connecticut. He studied at Dartmouth and Yale Colleges, and was intended for the profession of the law, but served as a military chaplain during the War of Independence. In 1787 he published a poem called *The Vision of Columbus*, which abounds in beautiful passages, but is overburdened with political and philosophical disquisitions, and distinguished by singularities of expression. Barlow came to England in 1788 as agent for a land company, but finding that he was merely a tool of swindlers, he threw up his post, went to Paris, where he signalled himself by zealous republicanism; published in 1792 in London a poem entitled *The Conspiracy of Kings*; and endeavoured also to work upon the public mind in England by political pamphlets. In autumn 1792 he was deputed by the London reformers, with whom he was associated, to proceed to Paris, where he received the rights of French citizenship. He was one of the commission sent by France for the organisation of Savoy. He spent some years on the continent of Europe in political, literary, and mercantile pursuits, in which he made a fortune, and served for a short time as American consul at Algiers. He returned to America in 1805, and was appointed ambassador to France in 1811. He died, 22d December 1812, near Cracow, when on his way to a conference with the Emperor Napoleon at Vilna. In his later years he was gathering materials for a history of the United States. His *Columbiad* (1807), at which he laboured for half a life-time, and the germ of which was contained in his *Vision of Columbus*, is an historical review of events from the time of Columbus to the French Revolution. Other works are his intemperate *Advice to the Privileged Orders* (1791-95), and the would-be humorous poem, *Hasty Pudding*, poor stuff spite of its popularity. See Todd's *Life and Letters of Joel Barlow* (1886).

Barm. See YEAST.

Bar'mecides, or BARMEKIDES, a Persian family descended from Barmak, a physician and priest of Balkh, in the province of Khorasan, the cradle of the greatness of the Abbaside califs, under whom the Bar'mecides rose to the highest offices in the state. Khálid bin Bermek became prime-minister of Abul Abbas Al-Saffah, the first Abbaside calif; and his influence enduring through the reigns of Al-Mansur and Al-Mahdi, the latter intrusted him with the education of his son, the celebrated Haroun Al-Raschid. The virtuous and able Yáhyá, the son of Khálid, was made vizier by Haroun upon his accession to the califate in 786, and both by his military skill and civil administration contributed largely to the prosperity of the reign. Under his four sons, Al-Fazl, Ja'afar, Mohammed, and Musa, the house rose to a pitch of power and splendour still more dangerous for a subject in the East than in the West. Al-Fazl and Ja'afar especially were virtual rulers of the great empire, which stretched from

Mauritania to Tartary, and were widely celebrated for a splendid magnanimity and generosity that completely eclipsed the calif. Their downfall was sudden, terrible, and infamous, and stains the great monarch's name with a blot that will never be washed away. After a convivial evening spent in different pavilions, at dead of night the calif sent for Ja'afar's head, and ordered Yáhyá and Al-Fazl to be flung into prison at Bagdad. According to the historian Al-Tabari, the whole Bar'mecide family, men, women, and children, numbering over a thousand, were slaughtered with scarce an exception. The motives for this atrocious massacre have never been adequately explained. The popular idea is that given in the *Arabian Nights*. The calif took such delight in Ja'afar's conversation that he desired his companionship even in the harem, and therefore married him *pro forma* to his eldest sister, the beautiful Abbásah. Ja'afar bound himself by a solemn oath to be his wife's husband in name only, but failed to keep the compact, and the consequences of his folly brought upon his head the merciless wrath of the offended calif. Some have hinted besides at a taint of heresy, or at least intolerance of heretics, that may have angered the calif. The opinion of Haroun 'the orthodox.' The opinion we can come to is that of Al-Mas'udi: 'As regards the ultimate cause' (of the catastrophe), 'it is unknown, and Allah is Omniscient.' Sa'id ibn Sálím, the grammarian, wrote: 'Of a truth, the Bar'mecides did nothing to deserve Al-Raschid's severity, but the day (of their power and prosperity) had been long, and whatso endureth long waxeth longsome.' The calif sincerely repented his enormous crime. From that day he never enjoyed refreshing sleep—he would have given his crown to bring Ja'afar back to life. Nor did the kingdom thrive after the extermination of this wise and enlightened family. Though the calif had forbidden mention of their name on pain of death, he could not save his ears from hearing their praises, the constant recurrence of which must ever have added a fresh sting to his penitence. The story, 'full of the waters of the eye,' as Firdousi says, took a strong hold upon the Moslem imagination, and has been told and retold a thousand times. See sec. iii. of the 'Terminal Essay,' in vol. x. (1886) of Sir Richard F. Burton's *Thousand Nights and a Night*.

BARMECIDE'S FEAST, an imaginary banquet, from the story in the *Arabian Nights* of one of the Bar'mecide family who put a series of empty dishes before a starving beggar, giving them magnificent names one after another as he did so. The beggar entered into the humour of his host, making as if he were eating heartily, and at last even getting so much flustered with his imaginary wine as to give him a good box on the ear, whereupon the prince, delighted with the poor fellow's patient humour, set a real dinner before him at once.

Barmen, a busy town in the district of Dusseldorf, Rhenish Prussia, extending in the beautiful valley of the Wupper for about 4 miles from close to Elberfeld almost to Langenfeld. It consists of a group of villages and three chief parts now connected together—Upper, Middle, and Lower Barmen—which united form the town of Barmen. Nowhere in Germany is so much manufacturing industry accumulated in a single spot. Barmen is the principal seat of the ribbon-manufacture on the Continent. Its fabrics go to all parts of the world. It produces linen, woollen, cotton, silk, and half-silk ribbons, cloth of various kinds, stay-laces, and thread. It has also considerable manufactures of soap, candles, metal wares, buttons, machinery, and pianofortes. There are, besides, in the valley, numerous bleach-fields and Turkey-red dye-works. Its workmen number

20,000, and the annual value of its manufactures is as much as £8,000,000. Barmen is a great missionary centre, and possesses the mission-house and seminary of foreign missions belonging to the Rhenish Missionary Society. Most of its inhabitants (in 1871, 74,947; in 1880, 95,941; in 1885, 103,066) are Protestants—only 15,000 being Catholics.

Barmouth, a picturesque and popular watering-place, in the county of Merioneth, Wales, at the mouth of the Maw, 10 miles W. of Dolgelly, and 230 miles NW. of London. Opposite, across the river, is Cader Idris, 2914 feet high. Pop. 1512.

Barnabas, St (properly **JOSÉ**), mentioned in the Acts of the Apostles as a fellow-labourer of Paul, and even honoured with the title of apostle. He is also supposed to have founded the first Christian community at Antioch. According to tradition, he became the first Bishop of Milan, but Ambrose makes no mention of him among the bishops who had preceded him in that see. He is variously reported to have died a natural death, or to have suffered martyrdom in Rome, Alexandria, or Cyprus, in 61 A.D. His festival is celebrated in the Roman Catholic Church on June 11.

The Epistle ascribed to him is the strongest internal evidence of being an Alexandrian forgery of the 2d century. The Epistle contains twenty-one chapters, the first four and a half in a Latin version, the rest in the original Greek. Its aim is obviously to strengthen the faith of believers in a purely spiritual Christianity. It commences by declaring that legal sacrifices are abolished, and then proceeds to show, though not in a very coherent or logical manner, how variously Christ was foretold in the Old Testament. In the tenth chapter, it spiritually allegorises the commands of Moses concerning clean and unclean beasts; in the fifteenth, it explains the 'true meaning' of the Sabbath; and in the sixteenth, what the Temple really prefigured. This concludes what may be termed the doctrinal portion of the Epistle; the remainder, which is of a practical character, describes the two ways of life—the way of Light and the way of Darkness, and closes with an exhortation that those who read it may so live that they may be blessed to all eternity. It is a simple, pious, and earnest work; but makes a far more judicious use of the New Testament than of the Old. It was ascribed to Barnabas by Clemens Alexandrinus and Origen, and it is found in the *Codex Sinaiticus*; while its authenticity, if not its authorship, was admitted by Eusebius and Jerome. It is now usually dated early in the 2d century. The best editions are those of Hilgenfeld (2d ed. 1877) and Gebhardt-Harnack (2d ed. 1876).

Barnabites, a congregation of regular canons of St Paul, founded at Milan in 1530, and sanctioned by Pope Clement VII. two years later. They were so called because the church of St Barnabas in that city was granted them to preach in. Their special duties were—to attend the sick, to preach, to instruct the young, and to take the charge of souls. They soon established themselves in Italy, France, Austria, and Spain, and enjoyed the privilege of teaching theology in the schools of Milan and Pavia. Many eminent men have been sent forth by them. Besides the three usual monastic vows, they took a fourth—not to sue for church preferments. In France and Austria they were employed in the conversion of Protestants. They have now only about twenty monasteries in Italy and Austria, with their chief house at Rome. They were expelled from France in 1880.

Barnacle, a common crustacean, technically known as *Lepas*, and belonging to the group of stalked Cirripedia (q.v.). Like the closely allied sessile acorn-shell, a barnacle may be said to be a

crustacean fixed by its head, and kicking the food into its mouth by its legs. So much are they disguised, however, in their fixed state, that they were formerly referred to the class of molluscs. Careful examination of the adult or inspection of the young

Fig. 1.—Comparison of normal Crustacean type with the degenerate condition of Cirripedes (after Darwin):

The shaded portions correspond. Note the arrested development of the abdomen, and the marked degeneration, though not decrease, of the anterior head region, which forms the barnacle stalk; *m*, mouth.

form at once demonstrates the really crustacean character of the animal. Though the barnacle is very markedly distinguished from the acorn-shell in the development of a fleshy and contractile stalk, the general structure is very much the same (see ACORN-SHELL). There is the same complex valved shell, the same six pairs of waving thoracic

Fig. 2.—A, *Lepas hilli*; B, *Scalpellum rostratum* (after Darwin).

legs, the same cement-gland aiding by its secretion to effect attachment, the same hint of degenerate antennae on the fixing surface, and so on. Like most of the Cirripedia, barnacles are hermaphrodite, while some nearly related forms exhibit minute, almost exclusively reproductive, 'complemental' males in close association with the normal hermaphrodites, or with females.

What has been already noted in regard to the life-history of acorn-shells, applies equally to barnacles. Little *Nauplius* (q.v.) larvæ escape from the egg-cases, and after moulting several times, pass into a second stage, like such water-fleas as *Daphnia* or *Cypris*. The first pair of appendages become suctorial, and after a period of free-swimming, the pupa settles down on some floating object, mooring itself at first by means of its antennary suckers, but rapidly becoming glued by the secretion of the cement-ducts. After fixing, important changes in structure and position speedily occur, the valved shell is developed, and the perfect adult form gradually assumed. The food consists of small animals swept to the mouth by the curled waving legs. Growth is somewhat rapid, but the

skin-casting of the adult is, except in one genus, much restricted. Neither the valves nor the uniting membrane, nor that forming the stalk, are moulted, but the surface gradually disintegrates and is removed, perhaps sometimes in flakes,

Fig. 3.—Attached Pupa of *Lepas australis* (after Darwin):

The cement-duct, b, is seen running to antennae, a.

Fig. 4.—Structure of *Lepas*, after removing right shell and integument (after Darwin).

a, cement-gland and duct; b, liver; c, testes; d, vas deferens; e, ovary; f, oviduct; g, thoracic legs; h, carina; i, tergum; k, scutum; l, cirrus or penis; m, muscle.

whilst new and larger layers are formed beneath. The commonest species, *Lepas anatifera*, is sometimes 16 inches in length, but most of this goes to the stalk.

The stalked Cirripedia have a world-wide distribution, especially, however, in the warmer seas. Nearly half of the Lepadidae are attached to floating objects, and are therefore peculiarly cosmopolitan. Some species are able to bore (*Lithotrya*), and more than one form has been found on shark, turtle, or whale. The stalked cirripedes are much more ancient than the sessile Balanidae, their golden age dating back to the cretaceous period. The history of knowledge in regard to the barnacle is a striking illustration of progress. While the early naturalists, such as Gerard (1597), abandoned themselves to the citation of popular myths, according to which the barnacle was the young form of a goose (see BARNACLE GOOSE), the animal became at a later date the object of serious but not exhaustive study, and was referred to the Mollusca, or regarded as intermediate between them and Crustacea; while within the last fifty years the discovery of the life-history has made the position of these interesting forms entirely intelligible, and the monograph of Darwin has furnished an approximately complete diagnosis of all the forms known in 1857. Subsequent research has only been an amplification and corroboration of his classic work. Apart from their occurrence on ships, floating timber, &c., the stalked cirripedes have little practical interest, except that a few forms (*Pollicipes*) are, like some of the acorn-shells, big and dainty enough to be eaten. See ACORN-SHELLS, CIRRIPIEDIA; Darwin's Ray Society Monographs; and Max Müller's *Science of Language* (2d series), for the myth of the barnacle goose.

Barnacle (or **BERNICLE**) **Goose** (*Anser bernicla* or *Bernicla leucopsis*), the bird which the natural history of former days gravely represented as deriving its origin from a crustacean—the barnacle. In the middle ages, during what has been well called the period of mythical zoology, the enigmatical structure of the barnacle (*Lepas anatifera*), known in Germany as the 'duck-mussel'

(*Enten-muschel*), somehow led it to be regarded as the young stage of the barnacle goose. The bird is in size smaller than the common wild goose,

Barnacle Goose.

being a little more than 2 feet long, and about 5 lb. in weight. The bill is somewhat longer than the head, the wings long and pointed, the tail short and rounded, the black and white plumage very prettily marked. It is a common winter visitant of the western coasts of Britain and of Ireland, and retires in spring to its home in more northern regions, where it breeds, vast numbers passing northward along the coast of Norway to the Arctic Ocean. It is highly esteemed for the table.

The Brent Goose, or Brent Barnacle (*Anser* or *Bernicla brenta* of some naturalists), has frequently received the name of barnacle goose, and no little confusion has thus arisen. It is a smaller bird with much darker plumage, remarkable for length of wing and powerful flight, and for its distant migrations. It is at home in high northern latitudes, but occurs as a common winter bird-of-passage in the United States and Canada, as also in Britain and on the continent of Europe. It is excellent for the table.

Very nearly allied to these species is the Red-breasted Goose, or Red-breasted Barnacle (*Anser ruficollis*), a beautiful bird, of which the neck and upper part of the breast are of a rich chestnut red. In size, it resembles the brent goose. It is a very rare visitant of Britain and of the continent of Europe, and is abundant only in the extreme north of Asia.—Another species called Hutchins' Goose or Barnacle (*A. hutchinsii*), of dark plumage, and with a triangular patch of white on each side of the head and neck, is abundant in Hudson Bay and the extreme north of America. The limits of the genera *Anser* and *Bernicla* are rather dubious. See GOOSE.

Barnard, HENRY, an American educationist, born in 1811 at Hartford in Connecticut, studied at Yale College, travelled in Europe, and became in succession school commissioner of Rhode Island, of the Normal School in Hartford, president of St John's College at Annapolis in Maryland, and, in 1867, commissioner of education at Washington. By his *American Journal of Education*, he did much to promote the best interests of his country by guiding the public mind on educational questions. His works on his chosen subject are numerous and important; among them are *Pestalozzi and Pestalozzism* (New York, 1861), and *Education* (2 vols. Lond. 1878-79).

Barnard, LADY ANNE, author of 'Auld Robin Gray,' was born in 1750, eldest daughter of James Lindsay, fifth Earl of Balcarres. In 1793 she married Andrew Barnard, a son of the Bishop of

Limerick, and colonial secretary to Lord Macartney at the Cape of Good Hope. There Lady Anne lived till 1807, when, losing her husband, she returned to London, her residence till her death on 6th May 1825. Her matchless lyric, named after the old Balcarres herd, was written as early as 1772 to sing to an ancient melody; but she first acknowledged its authorship in 1823 to Sir Walter Scott, who two years later edited it for the Bannatyne Club, with two continuations—poor, as such mostly are. See the Earl of Crawford's *Lives of the Lindsays* (1849).

Barnard Castle, a market-town in the county of Durham, on the left bank of the Tees, 15 miles W. of Darlington by rail. On a rocky height over the river are the ruins of a castle built in 1112-32 by Barnard Baliol (q.v.), ancestor of John Baliol, king of Scotland, who was born in the castle, and founded an almshouse in the town. Barnard Castle is the scene of part of Scott's *Rokeby*. Near it is an art museum, French Renaissance in style, presented to the town in 1874 by the Countess Montalbo, in which are many of the art treasures formerly in Streatlam Castle. Pop. (1851) 4357; (1881) 4544.

Barnardo, THOMAS J., F.R.C.S.E., founder of the 'Barnardo Homes' for homeless children, had his attention first turned in this direction by the condition in which he found a boy in a ragged school in East London in 1866. Following up the subject, he began to rescue children who had found their only shelter at night under archways, or in courts and alleys. These were introduced to his homes, where they received an industrial training, were saved from a possible career of crime, and enabled to achieve an honourable position in life. In 1887 over 10,000 boys and girls had been so reclaimed; at the same time Dr Barnardo had under his direction 33 separate institutions in the United Kingdom and the colonies, including an immigration depôt in Ontario, an industrial farm in Manitoba, a home for babies, and a hospital for sick children.

Barnaul, a town of Western Siberia, in the government of Tomsk, about 290 miles SSW. of that town. Situated on the Obi, it is the centre of mining and smelting industries in Western Siberia, contains the largest furnaces of the Altai, and has a busy population of 14,000. The town has a school of mines.

Barnave, ANTOINE-PIERRE-JOSEPH-MARIE, a notable figure in the French Revolution, born at Grenoble, October 22, 1761. He early attracted attention as an eloquent pleader in the parliament of Grenoble, and was sent as the deputy of his province to the States-general in 1789. Here his trenchant logic, keen wit, and vehement eloquence on behalf of public liberty quickly brought him to the front. He opposed the absolute veto, carried through the confiscation of church-property to the use of the nation, the emancipation of the Jews, and the abolition of the religious orders, and was mainly instrumental in the liberation of the slaves and reorganisation of the colonies. He became the idol of the people, particularly after his victory over Mirabeau, in the question of the power of peace and war, which Mirabeau wished to remain with the king, and Barnave successfully claimed for the National Assembly. After the flight to Varennes, he was deputed to conduct the royal family back to Paris, and this duty he discharged with a fine courtesy to the unhappy queen. Subsequently he advocated more moderate courses, defended the inviolability of the king's person, and resisted the assertion by the assembly of its power to remove ministers. This led to his being regarded as a renegade from the national

party, and to his being assailed by the fierce vituperations of the journalists. He retired to his native place on the dissolution of the National Assembly; but after the 10th of August 1792, he was impeached for an alleged treasonable correspondence with the court, and was brought to Paris, tried before the Revolutionary Tribunal, condemned, and guillotined on the 29th of November 1793. Barnave was the second orator in the Constituent Assembly. His manner was grave, very lucid, but somewhat cold. At the close of one of his greatest triumphs, Mirabeau thus characterised him: 'I have never before heard him speak so well, so clearly, and so long; but there is no divinity in the man.'

Barnes, ALBERT, an American theologian and celebrated biblical expositor, was born at Rome, state of New York, on 1st December 1798. He had thoughts at first of devoting himself to the study of law, but eventually prepared for the ministry at Princeton theological seminary. He had charge of a church in New Jersey, and was minister of the first Presbyterian church of Philadelphia, from 1830 to 1867, when he resigned on account of failing eyesight. He was a thoughtful and eloquent preacher. At one time he was tried for heresy, the charge being based mainly on some passages in his notes to Romans, but he was acquitted. He afterwards attached himself to the New School branch of the Presbyterians, and was a strong opponent of slavery. He is best known by his *Notes* on various parts of the Old and New Testaments, specially adapted for the use of Sunday schools and Bible classes, which have had an extraordinary circulation. These *Notes* are distinguished less by original critical power, than for their plainness, simplicity, and directness. He died at Philadelphia, 24th December 1870; a short time previously he had completed a new edition of his *Notes* on the New Testament (6 vols. 1871-72). He issued besides many volumes of sermons, an introduction to Butler's *Analogy*, *Evidences of Christianity*, and some Sunday-school manuals.

Barnes, WILLIAM, perhaps the first of English purely pastoral poets, was born in the vale of Blackmore, of an old Dorsetshire stock that had once owned land, February 22, 1800. Spite of early difficulties, he acquired remarkable learning, and after some time in a solicitor's office, taught a school at Dorchester with success. After obtaining a university degree and receiving ordination, he took the curacy of Whitcombe in 1847, from which he passed to the rectory of Winterbourne Came in 1862. Meantime he had been making himself widely known by his fine idyllic poetry in the Dorsetshire dialect, 'the bold and broad Doric of England.' His first volume appeared in 1844; the second, the well-known *Hoomely Rhymes*, in 1859; the third in 1862; the three were collected together in 1879, and published as *Poems of Rural Life in the Dorset Dialect*. These poems reveal straightforward simplicity and sincerity of style, with rare imaginative insight into the simple joys and sorrows of country life. But his sympathetic affection for the human life that 'clothes the soil' is paralleled by his patience in observing the quiet life of nature, and his power of reproducing artistically for others the impression it makes upon the mind. The sweet air of southern England blows through every stanza he writes, and has had a charm of quite singular influence on thousands who have seen Dorsetshire but with the inward eye. His verses are none the less completely artistic that the art is all unconscious, and none the less completely beautiful that the representation of man and nature in them is within its limits completely true. His world was the secluded vale of Blackmore; and its humble

folk, with all their quaintness and humour, he has photographed with absolute truth, though with the instinct of the artist he has chosen as subject of poetic treatment only such episodes as are in themselves beautiful. There was nothing of Crabbe in his poetical equipment, and it need not be objected to a particular poet that he had eyes only for the pathos and beauty of country life, none for its squalor and misery. 'His verse is sometimes deficient in lyrical swing, as is apt to be the case when descriptive poetry is written in the dancing measures, which are too entirely emotional for work so calm and contemplative as the nature poetry of the English country.' Barnes made himself well known also by his chivalrous attempt to preserve the purity of the mother-tongue. His *Outline of English Speech-craft* (1878) is an attempt to teach the English language in purely English words. His tenses are 'time-takings,' adjectives are 'mark-words of suchness,' degrees of comparison are 'pitchmarks;' and sentences like 'these pitchmarks offmark sundry things by their sundry suchnesses' make large demands upon the reader's ingenuity. He wrote several works of value on philological subjects, and kept up an active interest in the progress of English scholarship almost till his death at the ripe age of eighty-six, October 1886. See the Life by his daughter, Mrs Baxter (1887).

Barnet, a town in the south of Hertfordshire, mostly on a hill-top, 11 miles to the NW. of London. Pop. (1881) 4095. Formerly a place of importance on the great northern coach-road, it has still large cattle-fairs. Here in 1471 was fought the famous battle of Barnet between the Yorkists and Lancastrians, in which the latter, after a desperate struggle, were routed, and their leader, Warwick, 'the king-maker,' killed, by which event Edward IV. was firmly established on the throne. A commemorative obelisk is now erected near the spot.

Barnett, JOHN, composer, born at Bedford, 15th July 1802, and for some time musical director of the Olympic Theatre, is known as the composer of *The Mountain Sylph* (1834), *Fair Rosamond*, *Farinelli*, and other operas, besides vaudevilles and songs.—His nephew, JOHN FRANCIS BARNETT, born in 1838, studied at the Royal Academy of Music, and at Leipzig. His works comprise *The Ancient Mariner*, a cantata (1867), *Paradise and the Peri* (1870), *The Raising of Lazarus* (1870), *The Lay of the Last Minstrel* (1871), and *The Good Shepherd* (1876).

Barneveldt, JAN VAN OLDEN, Grand Pensionary of Holland, who played a great part in the long struggle with Spain, was born at Amersfoort in Utrecht in 1547, and in 1569 commenced practice at the Hague as an advocate. He early showed great ardour in the cause of the independence of his country; and as advocate-general of the province of Holland (1585), he proved equally his insight into affairs and his address in diplomatic management. Through Barneveldt's influence Prince Maurice succeeded his murdered father as stadtholder; but Barneveldt it also was, who, becoming head of the republican party, opposed the warlike tendencies of Maurice, concluded (1609) a truce with Spain, and prevented the States-general from joining the revolt of the Bohemians. His influence excited the House of Nassau to still greater jealousy, which in the religious controversies between the Remonstrants and Gomarists degenerated into the bitterest hostility (see ARMINIUS). To obviate a civil war, Barneveldt proposed an ecclesiastical assembly, which resulted in agreeing to a general toleration in respect of the disputed points. The States at

first concurred in this wise measure; but the intrigues of the Orange party brought about a change of views, by representing the Remonstrants as secret friends of Spain. Barneveldt, who sympathised with the more tolerant principles of that party, was attacked in scurrilous publications, and was insulted even in the meeting of the States by the mob, with whom Maurice was an idol. The strife between the Remonstrants and Gomarists became hotter every day, and threatened to end in civil war. In 1618 Barneveldt was illegally arrested, along with Grotius and Hoogerbeets, and thrown into prison. In the following November Maurice procured the summoning of the Synod of Dort, which condemned the Remonstrants with the utmost rigour and injustice. In March 1619, while the Synod was still sitting, Barneveldt was brought to trial before a special commission of twenty-four judges, who condemned as a traitor the innocent man to whom his country owed its political existence. It was in vain that his friends and relations raised their voice; Maurice was not to be moved. On May 13, 1619, the venerable man of 71 years of age mounted the scaffold, and laid down his head with the same firmness that he had shown through all the events of his life. His two sons were at the same time dismissed from office. Four years after their father's death they took part in a conspiracy against the life of the prince, which, however, was discovered. The elder escaped to Antwerp, the younger was seized and beheaded. See Motley's *Life of Barneveldt* (2 vols. 1874).

Barnfield, RICHARD, born at Norbury, Shropshire, in 1574, was educated at Brasenose College, Oxford, and died, a country gentleman, at Stone, in Staffordshire, in 1627. His three little volumes of pastoral poetry, quaint, rhythmic, dainty, but over-luxuriant, cloying with too much sweetness, appeared in 1594, 1595, and 1598. The last contained the ode, 'As it fell upon a day,' and the sonnet, 'If Musique and sweet Poetrie agree,' which, printed by Jaggard in the *Passionate Pilgrim* (1599), were long attributed to Shakespeare. There are complete editions of his poems by Grosart (1876) and Arber (1882).

Barnsley, a manufacturing town in the West Riding of Yorkshire, on the river Dearne, 10 miles S. of Wakefield, and 15 N. of Sheffield by rail. Standing high, in the midst of a rich mineral district, it has manufactures of linen, iron, steel, and glass, bleaching and dye works, &c. Besides ample railway communication, it has the advantage of a canal. The county court was built in 1861; and in the same year a pretty public park of 20 acres was given to the town. Barnsley was incorporated as a municipal borough in 1869. Pop. (1851) 13,437; (1881) 29,789; (1891) 35,427.

Barnstable, a port of entry, with coasting and fishing trade, in Massachusetts, U.S., situated on the south side of Barnstable Bay, 65 miles SE. of Boston. Pop. (1880) 4242.

Barn'stapse, a town of Devonshire, on the right bank of the tidal Taw, 6 miles from its mouth, and 39½ NW. of Exeter by rail. The Taw is here crossed by a 13th-century bridge of 16 arches, which in 1834 was widened by iron-work on either side. Owing to the silting up of the river and harbour, much of the trade of Barnstaple has been transferred to Bideford. It has manufactures of lace and pottery. Barnstaple has existed since the reign of Athelstan, who built a castle here. The poet Gay was educated at the grammar-school, a pre-Reformation chapel. The parish church is of 14th-century date; and there are a town-hall (1855), an Albert memorial tower (1863), &c. Till 1885 Barnstaple returned two members to parliament. Pop. (1861) 10,743; (1881) 12,282; (1891) 13,058.

Barnum, PHINEAS TAYLOR, American showman, was born at Bethel, Connecticut, July 5, 1810. His father was tailor, farmer, and tavern-keeper in turn. At thirteen young Barnum was employed in a country store; and about five years afterwards, went largely into the lottery business. When only nineteen, he married clandestinely, and then moved to Danbury, where he edited *The Herald of Freedom*, and was imprisoned 60 days for a libel. In 1834 he removed to New York, where hearing of Joice Heth, the reputed nurse of General Washington, he bought her for 1000 dollars, and with the aid of wholesale advertising, exhibited her to considerable profit. He continued in the show business from 1836 to 1839, but reduced again to poverty, he sold Bibles, exhibited negro dancers, and wrote for newspapers, until in 1841 he bought Scudder's American Museum in New York, which he raised at once to prosperity by exhibiting a Japanese mermaid, made of a fish and monkey, a white negress, a woolly horse, and finally, a noted dwarf (Charles S. Stratton, of Bridgeport), styled General Tom Thumb, whom he exhibited in Europe in 1844. In 1847 he offered Jenny Lind 1000 dollars a night for 150 nights, and received 700,000 dollars—the concert tickets being sold at auction, in one case as high as 650 dollars for a single ticket. He built a villa at Bridgeport, in imitation of the Brighton Pavilion, and engaged in various speculations, one of which—a clock-factory—made him bankrupt. Settling with his creditors in 1857, he engaged anew in his career of audacious enterprises, and made another fortune. In 1866 he stood as a candidate for a seat in congress, but was unsuccessful. His *Autobiography* (1854, since greatly enlarged) has the merit at least of frankness. In 1865 he published *The Humbugs of the World*; in 1869, *Struggles and Triumphs*; and in 1883, *Money-getting*. In 1868 he relinquished the business of showman, resuming it, however, in 1871, when he organised a museum, menagerie, circus, &c., which required 500 men and horses to transport it through the country. For his hippodrome in New York he purchased for £33,000 from Messrs Sanger, London, in 1874, a duplicate of the whole plant for the pageant 'Congress of Monarchs.' His 'Greatest Show on Earth' requires 100 railway cars for its conveyance. In 1879 he estimated the number of his patrons up to date as 90,000,000. In 1882 a day's receipts for his Great Show in Boston amounted to over £3000. The elephant 'Jumbo,' purchased in 1882 from the London Zoo, for £2000, was killed in 1885; and in 1887 Barnum's menagerie was destroyed by fire. In 1889 his show appeared at the Olympia in London. He died 7th April 1891, worth \$5,000,000.

Baroche, PIERRE-JULES, a French politician, born at Paris, November 18, 1802. He was elected in 1847 to the Chamber of Deputies, and was made Procureur-général. In March 1850 he became Minister of the Interior, and a decided Bonapartist. He was appointed Minister of Foreign Affairs in 1860, and Minister of Justice and Public Worship in 1863. He died October 29, 1870.

Baro'da, the second city of Guzerat, and third in the Presidency of Bombay, capital of the territory of the Guicowar (Gakewar), in the state of the same name. It is 248 miles N. of Bombay, with which it is connected by railway. It stands to the east of the Viswanitri, which is here crossed by four stone bridges, one of which is of singular construction—an upper range of arches resting on a lower one. It has several palaces, Hindu and other temples, contains the chief court of the state, a high-class school, and two vernacular schools. The majority of the houses are mean and overcrowded. Baroda occupies an

important position between the coast and the interior, and the trade is considerable. Pop. (1881) 101,818.—The Mahratta state of Baroda, the political control of which in 1875 was transferred from Bombay to the government of India, includes the territories of the Guicowar in various parts of the province of Guzerat. Area of these territories, 8570 sq. m. (larger than Wales). The northern districts, which form a wide plain, are drained by the Nerbudda, Tapti, Mahi, and other rivers. The soil is fertile here; ruined temples, deserted towns, and tanks half filled with mud, are a witness of former prosperity. A military force of about 3000 is maintained. In the northern division there is a famous breed of large white cattle; grain, cotton, opium, tobacco, sugar-cane, and oil-seeds are the chief agricultural products, and grow luxuriantly. The Guicowar, Malhar Rao, installed in 1871, was deposed by the British government for obvious misrule (1873-75) and a suspected attempt to poison the British resident, and another member of the Baroda family was, in 1881, appointed in his stead. Pop. (1881) 2,185,005, of whom 1,852,868 were Hindus, 174,980 Mohammedans, 46,718 Jains, and 8118 Parsees.

Baro'meter (Gr. *baros*, 'weight,' and *metron*, 'a measure'), an instrument for measuring the weight or pressure of the atmosphere, invented in 1643 by Torricelli (q.v.). The term is generally understood to refer to one in which the measure is the height of a column of liquid sustained by atmospheric pressure. The fundamental principle of the construction of the barometer is best shown in the experiment which led Torricelli to the discovery of the pressure of the air. A glass tube, about 33 inches in length, open at one end, is completely filled with mercury, and, being firmly closed by the thumb, is inverted and placed vertically in a cup containing mercury. When the thumb is removed, the mercury sinks in the tube till it stands, generally, about 30 inches above the level of the mercury in the cup, leaving in the upper part a space free of air, which receives the name of the Torricellian vacuum (fig. 1). The mercury within the tube being thus removed from the pressure of the air, while that in the cup is exposed to it, the column falls, till the pressure at the section of the whole, in the same plane as the surface of the mercury in the cup, is the same within and without the tube. A similar experiment is seen when, in a U-shaped tube, having one branch much wider than the other, a column of mercury in the narrow branch balances a column of water nearly 14 times as high in the other. In the Torricellian experiment, we have the air and the space occupied by it taking the place of the wide water branch of the U-shaped tube, and the glass tube and mercury forming the narrow branch, as before; the narrow branch, however, in this case being closed above, to prevent the air from filling, as it were, both branches. In both cases, the heights of the columns are inversely as the specific gravities of the liquids of which they consist; and as air is about 10,000 times lighter than mercury, we should have the aerial column 10,000 times 30 inches high. It will be found, under ATMOSPHERE, that from the air lessening in density as it ascends, the height is considerably greater. Any changes that take place in the density of the aerial column will be met by corresponding changes in the height of the mercurial column, so that as the latter rises or falls, the former increases or diminishes. We have, then, in this simple tube, an infallible index of the varying amount of atmospheric pressure, and, in fact, a perfect barometer. The changes, however, are indicated on a scale at least 10,000 times diminished, so that the variations in the tube show very considerable changes in the weight

of the atmosphere. If water be used instead of mercury, the water column would be 14, or, more correctly, 13.6 times as high as the mercurial column, or about 34 feet; and the scale on which the changes take place would be correspondingly magnified, so that a water barometer should be much more delicate than a mercurial one. Water is, however, exposed to this serious objection, that its vapour rises into the empty space above, and causes by its elasticity a depression of the column, the depressions being different for different temperatures. At zero, Fahrenheit, for instance, the depression thus arising would be half an inch, and at 77°, more than 1 foot. It would be doubtful, likewise, at the time of any observation, whether the space referred to was filled with vapour of the elasticity corresponding to the observed external temperature or not, so that the necessary correction could not with certainty be made. The vapour of mercury, on the other hand, at 77° F.—a temperature considerably above the average—produces in the barometer a depression of only $\frac{1}{115}$ of an inch, an amount practically inappreciable. After 200 years of experience and invention, we have yet no better index of the pressure of the atmosphere than the simple mercurial column of Torricelli, and in all exact observations it is, in one modification or another, taken as the only reliable standard.

Simple as the barometer is, its construction demands considerable care and experience. It is of the first importance that the mercury to be used is chemically pure, otherwise its specific gravity and fluidity are impaired, and the inside of the tube becomes coated with impurities in such a way as to render correct observation impossible. Mercury as usually sold, is not pure; and before being employed for barometers, must be shaken well with highly dilute but pure nitric acid, to remove extraneous metals and oxides. The same object is effected more thoroughly by keeping it several weeks in contact with the dilute acid, stirring every now and then. After either process, the metal must be thoroughly washed with distilled water, and dried. In filling the tube, it is essentially necessary to get the column free from air and moisture. To effect this, the mercury, after filling, is boiled in the tube, so that air and moisture may be expelled, partly by the heat, and partly by the vapour of the mercury. This process demands great experience and skill, but the same end may be more easily and as effectually attained by boiling the mercury, in the first instance, in an atmosphere of carbonic acid, and then pouring it into the previously heated tube by a filler reaching to the bottom of it. Such care is only expended on the best instruments; ordinary weather-glasses, not needing to be quite accurate, are more simply filled. Notwithstanding all these precautions, minute bubbles of air may manage to keep secreted, and creep up in the course of time into the Torricellian vacuum. To obviate this risk of error, an air-trap is recommended by which any air that may accidentally find its way into the tube, or may be left in it, is arrested in its ascent to the top, and any damage to the instrument averted.

Barometers are usually divided into two classes—cistern barometers, and siphon barometers. The simplest form of the cistern barometer is that shown in fig. 1, which only requires to be set properly in a frame, and provided with a scale, to make it complete. Fig. 2 presents another form of that class, being that generally seen in weather-glasses or ordinary barometers. The tube is bent at the bottom, and the cistern is merely an expansion of the lower end. Very generally, the cistern is hidden from view, and protected from

injury by a wooden cover in front. There are two causes of inaccuracy in cistern barometers—one being the capillarity, which tends to lower the

column; and the other being the difference of level in the cistern caused by the fluctuations in the tube, which renders the readings on the fixed scale at one time too great, and at another too small, according as this level rises above or falls below the original level, or zero-point, from which the scale is measured. The effect of capillarity may be avoided by using tubes of more than half an inch in bore, in which the depression becomes so small that it may be left out of account. In smaller tubes it is estimated from tables constructed for the purpose. Wide tubes have the additional advantage, that atmospheric changes are seen earlier in them than in narrow tubes, there being less friction in the wider than in the narrow. With reference to the error of level, it must be borne in mind that the height of the column sustained by the atmosphere is always to be reckoned from the surface level of the mercury in the cistern. The larger the capacity of the cistern compared with that of the tube, the less becomes this error; for then a very considerable rise or fall in the tube, when spread over the surface of the cistern, makes only a slight difference of level. Care should then be taken to make the cistern as large as possible. The barometer in which the error of level is completely obviated, is that invented by Fortin, which, from its being in every respect the most perfect cistern barometer, deserves particular notice. The cistern, and the lower portion of the tube of this barometer, are shown in fig. 6. The cistern is made of boxwood, with a movable leather bottom, *bb*, and a glass cylinder is inserted into it above, all except the glass being encased in brass. In the bottom of the brass box a screw works, on the upper end of which the leather rests, so that by the sending in or taking out the screw, the bottom of the cistern, and with it the cistern level of the mercury, can be raised or depressed at will. A small ivory pin, *p*, ending in a fine point, is fixed to the upper frame of the cistern; and when an observation is made, the surface of the mercury is made to coincide with the point of the pin as the standard level or zero-point from which the barometric column is to be measured. The tube of the barometer—the upper part of which is shown in fig. 3—is inclosed in one of brass, which has two directly opposite slits in it for showing the height of the column, and on the sides of these the graduation is marked. A

brass collar, *cc*, slides upon the tube with a Vernier (*q.v.*), *vv*, marked on it for reading the height with great exactness, and in which two oblong openings are cut, a little wider than the slits in the

Fig. 6,

8.

brass tube. When a reading is taken, the collar is so placed that the last streak of light is cut off by the two upper edges of the openings, or until they form a tangent to the convex mercurial curve. By this means, the observer is sure that his eye is on a level with the top of the column, and that the reading is taken exactly for this point. This is the contrivance usually adopted to prevent the error of parallax, or that caused by the eye being slightly above or below the top of the column, by which the scale and the top of the column are projected too high or too low, the one upon the other, as the case may be. The only other arrangement worthy of mention for effecting the same object is that by Weber, who etches the scale on a piece of silvered glass placed over one side of the tube; and when—the mirror and tube being vertical—the image of the eye appears along with the vertex of the column, the eye is in the same horizontal line with it. Fortin's barometer is generally arranged so as to be portable, in which case the screw, *s*, is sent in until the mercury fills very nearly the whole cistern, by which the air is kept from entering the tube during transport, the leather yielding sufficiently at the same time to allow for expansion from increase of temperature. It packs in a case, which serves as a tripod when the instrument is mounted for use. On this tripod it is suspended about the middle, swinging upon two axes at right angles to each other, so that the cistern may act the part of a plummet in keeping the tube vertical—the position essential to all correct measurements.

The siphon barometer consists of a tube bent in the form of a siphon, having the same diameter at the lower as at the upper end. Fig. 7 represents a simple form of it. The tube travels along the board on which it is placed by passing easily through fixed rings or collars of brass. A scale, divided in inches and parts of an inch, is fixed on the upper part of the board; and when an observation is taken, the tube is adjusted by the screw, *s*, working below it, so that the top of the lower mercurial column

may be on a level with the fixed mark, *a*, or the point from which the fixed scale is measured. In the best forms of the siphon barometer, both tube and scale are fixed, the latter being graduated upwards and downwards from a zero-point near the middle of the tube, and the height of the column is ascertained by adding the distances from it of the upper and lower levels. The siphon barometer is in some respects a more perfect instrument than the cistern barometer. In the first place, the bore at the upper and lower ends of the tube being the same, the depression arising from capillarity is alike for both, and the error from this cause disappears in taking the difference of the heights. In the second place, since the final reading is got from a reference to both upper and lower surfaces, the error in the cistern barometer produced by the different capacities of the tube and cistern is effectually avoided. On the other hand, the taking of two readings, one for each column, is a serious addition to the labour of observation, and means also additional risk of error. Gay-Lussac's siphon barometer (fig. 4) is bent near the bottom, so as to allow of the lower branch being placed in the same straight line as the upper one—a position highly favourable to accurate observation. When constructed for transport, the tube at the bend is narrowed, as in the figure, to a capillary width, which effectually excludes the air; and when the tube is inverted (fig. 5), being the position in which it is carried, the mercury is nearly all held in the longer branch. Such a tube when mounted, like Fortin's barometer, makes an excellent travelling instrument, and is comparatively light, from the small quantity of mercury it contains (see *ANEROID*).

The wheel barometer, originally invented by Hook, and generally seen as a hall or parlour ornament, has nothing to recommend it as a trustworthy instrument. Fig. 8 shows the main features of its construction. It is essentially an ordinary barometer, like the siphon barometer below, but having a cistern above, to increase the amount of variation in the lower branch. A small piece of iron or glass, *f*, floats on the open surface, and a thread is attached to it, and passed over a small wheel, *a*, fixed to a horizontal axis, to which it is kept tight by a small weight, *c*, hanging at the other end. A pointer, *p*, is fixed to the other extremity of the horizontal axis, which moves to the right or left of the dial, *dd*, according as the mercury falls or rises in the lower branch. The great sweep which the index takes, as compared with the comparatively minute variations of the mercurial column, is the only merit of this instrument. It is easy to see, that with so much intervening between the mercury and the index, the chances of error from hygrometric variations, friction, and other causes are very considerable.

The correction of the barometer for temperature is essential. Mercury expands $\frac{1}{1000}$ of its bulk for every degree of Fahrenheit's thermometer; if, then, a barometer stands at a height of 30 inches when the temperature of the whole instrument is 32°, it will stand at 30.7 if its temperature be raised to 60°. This increase of the length of the column by the tenth of an inch is not due to any increased pressure, but solely to the expansion of the mercury under a higher temperature. In order, therefore, that all observations may be compared correctly with each other, the observed heights are reduced to what they would be, if the temperature of the whole instrument with its contained mercury was at 32°. The rule for reduction is very simple: Multiply the number of degrees above or below 32° F. by the observed height, divide the product by 9990, and subtract or add the quotient from or to the observed height for the reduced height. Tables for this purpose have been published by the Royal Society, from which the corrections are found at once.

The variations of the barometer are both periodical and irregular. Periodical variations are those taking place at stated and regular intervals, and irregular, such as have no regular period of recurrence. Perhaps the only truly periodical variation is the daily one, which varies from about 0.150 to 0.001 inch. In most regions of the globe there is also a well-marked annual variation, widely different for different regions. Accidental variations give a range of about $4\frac{1}{2}$ inches. The lowest hitherto observed is 27.333 inches, reduced to sea-level, at Ochertyre, Perthshire, on January 26, 1884 (see ATMOSPHERE); and at Barnaul, in Siberia, a pressure of 31.630 inches was recorded on December 16, 1877, where the temperature on that day fell to -54.4° .

The uses of the barometer may be classified into physical, hypsometrical, and meteorological. It is of essential use in all physical researches where the mechanical, optical, acoustical, and chemical properties of air or other gases are dependent on the pressure of the atmosphere. Its use in hypsometry, or the art of measuring the heights of mountains, is very valuable. When a barometer is at the foot of a mountain, the pressure it sustains is greater than that which is at the top by the weight of the column of air intervening between the top and bottom. A formula of considerable complexity is given by mathematicians for finding approximately the true height of a mountain from barometrical and thermometrical observations made at its base and summit, the interpretation of which does not come within the compass of this work. The following rules give very nearly the same result: (1) Reduce the mercurial heights at both stations to 32° F. (2) Take the logarithms of the corrected heights, subtract them, and multiply the result by 10,000, to give the approximate height in fathoms of the upper above the lower station. (3) Take the mean of the temperature at both stations, take the difference between this mean and 32, multiply the difference by the approximate height, and divide the product by 435. This last result is to be added to the approximate height, if the mean temperature is above 32, and subtracted, if below, to find the true height in fathoms.

The best known use of the barometer is as a meteorological instrument or as a weather-glass. Opticians sometimes attach to certain heights of the barometer particular states of weather, and at certain points of the scale the words 'Rain,' 'Changeable,' 'Fair,' &c., are marked; but the connection thus instituted is very misleading. All who would examine carefully the connection of barometric heights with changes of the weather, must discard entirely the use of these terms, seeing that it is not the actual height of the barometer at any place, but this height as compared with that of immediately surrounding regions, which indicates the weather and the strength of wind accompanying it. Several elaborate codes of rules have been drawn up to serve as a key to the variations, but as these are more or less of a local and hypothetical character, they would be here out of place. Generally speaking, a falling barometer indicates rain; a rising barometer, fair weather. A steady barometer foretells a continuance of the weather at the time; when low, this is generally broken or bad, and when high, fair. A sudden fall usually precedes a storm, and the violence of the wind is in proportion to the barometric gradient. An unsteady barometer indicates unsettled weather; gradual changes, the approach of some permanent condition of it. The variations must also be interpreted with reference to the prevailing winds, each different wind having some peculiar rules. The connection between changes of weather and the pressure of the atmo-

sphere is by no means well understood. One or two points may, however, be stated. Since, as has been shown by Dalton, moist air is lighter than dry air, the barometric column will read relatively low wherever a large amount of aqueous vapour has displaced a part of the drier air. The south and south-west winds, which are, in Western Europe, more than any other, the rain-bringing winds, are warm and moist winds. Now, a column of such air, to be of the same weight as one of cold dry air, must be higher; but this cannot occur in the atmosphere, for no sooner does the warm moist column, by its lightness, ascend to a height where the pressure of the surrounding air is less than its own, than it ceases to rise farther, and thence flows over as an upper current in the directions where pressure is less. It follows that pressure is relatively low over any region where for the time the air is moister and warmer than in adjoining regions. On the other hand, the northerly and easterly winds, being comparatively cold and dry, are accompanied with fair weather and a high barometer. The rain attendant on a low barometer, as well as the fine weather accompanying a high barometer, are in a considerable degree to be regarded as the necessary concomitants of our geographical position—of our having the land to the east, and the ocean, with its large evaporating surface, to the west of us. In Great Britain a high and rising barometer frequently accompanies east winds with a drenching drizzle. On the La Plata River, on the other hand, matters are often the reverse of what they are with us; for there the cold south-east wind, coming from the ocean, brings rain with a high barometer, and the land winds, heated by the plains of South America, maintain fine weather with a low barometer. That the temperature, as well as the moisture of the air, is an important cause of the changes of the barometer, is also shown by the fact that, in the tropics, where the variations of the temperature are slight compared with the temperate zones, the barometer experiences almost no change; and also that the region of lowest mean barometer in Asia in summer is not the region of largest rainfall, but the region of highest temperature. See the standard works on Meteorology, such as the books by Blanford, Buchan, Kaemtz, Loomis, and R. H. Scott.

Barometz, or Tartarian or Scythian Lamb, the prostrate stem of a fern (*Aspidium barometz*) which grows in the salt-plains near the Caspian Sea. It is shaggy with yellow silken down, from which the ancients are said to have woven costly garments. The hairy covering, and a rough resemblance to an animal, seem to have formed the basis of the extraordinary opinions which were current in Russia and elsewhere, as late as a century ago, in regard to this fern. It was believed to be at once plant and animal, to grow on a stalk, but yet to have head, eyes, ears, and limbs like a lamb, to eat grass, and in other marvellous ways to show forth 'the glory of the Creator to whom all things are possible' (Herberstein, 1563). The word is an erroneous form of the Russian *baranetz*, diminutive of *baran*, 'ram.' Erman (*Travels in Siberia*, vol. i. p. 111) supposes that these fables simply originated from embellished accounts of the cotton-plant. The red viscid juice is sometimes used as an astringent.

Baron, a term originally derived from late Lat. *baro*, 'a man,' acquired, like *homo*, under the feudal system, the meaning of a vassal, 'homage' (*hominium*) being the ceremony by which the vassal became the *man* of his lord. By the 13th century in England the highest class of the king's tenants-in-chief, all of whom were holders of several knight's fees, had come in a more restricted sense

to be called barons, the term sometimes including earls and spiritual lords, besides those who were barons and nothing more. Barons possessed a civil and criminal jurisdiction, and were liable, or entitled, to take part in the general council of the nation. The provisions of the Great Charter show that in the time of King John a distinction was recognised between two classes of barons; the right of the 'barones majores' being secured to a personal summons to parliament, along with the archbishops, bishops, abbots, and earls; while the other tenants-in-chief of the crown were summoned generally by the sheriff. This personal summons became the means of defining who were great barons; and in the course of time the right to it came to be regarded as hereditary, a quality thoroughly established in the reign of Edward I. The term baron came more and more to mean the holder of a seat in the House of Lords; the existence of territorial barons, who had no seat in parliament, passed out of mind; and the word baronage came to be regarded as an equivalent for the peerage generally, members of the higher orders of the peerage being all barons. Barons who were such in virtue of their summons were known as barons by writ; and their baronies were inherited by heirs male and female. When parted between two or more co-heiresses, such a barony falls into abeyance, until one, or the sole heir of one of the co-heiresses only survives. It is held that the crown can at any time terminate the abeyance in favour of one of the co-heirs. The creation of barons by patent, first introduced in the reign of Richard II., made the dignity personal, the patent limiting the succession to it. John de Beauchamp of Holt, the first baron by patent, was created Baron of Kidderminster by letters-patent, dated 10th October 1387, to himself and the heirs-male of his body. It was not till the twenty-fourth year of Henry VI. that the practice of creating barons in this way became general; but the creation of barons by writ has now been long discontinued, except in the case of the eldest son of a peer of a higher grade, who is occasionally summoned to parliament in right of his father's barony.

In Scotland, as in England, the term baron at first included all crown vassals—but it came in the course of time to be applied in a more restricted way to such of them as had had their lands erected by the king in *liberam baroniam*. The whole barons, even in the wider sense of the word, were, theoretically at least, under the obligation to attend the council of the nation. By the less considerable landholders (even such as were in this stricter sense barons) this obligation was felt a grievous burden, and doubtless it was not very rigidly enforced. A statute of James I. in March 1427–28 enacted that the 'small barons' should be excused from attending parliament, provided they sent two or more wise men from each sheriffdom to represent them. Though this act was a failure in its main object, the introduction of parliamentary representation (which was not actually established till 1587), it seems to have afforded a quasi-sanction to the habitual absence from parliament of all but the largest landowners. The hereditary title of lord of parliament, first introduced in the 15th century, was in Scotland by no means correlative with the status of baron, it being but a small proportion of the holders of charters of barony who were invested with that dignity. About the end of the 16th century, lords of parliament began occasionally to be styled 'barones majores' in contradistinction to other holders of these lands by barony, who were 'barones minores'; and when, with the more intimate intercourse between the two countries, something like the English idea of peerage sprang up in Scotland, the position of the former was

accounted analogous to that of English barons; their proper designation, however, continuing to be lords, not barons, as distinctly recognised even after the Union of 1707 had put them in possession of all the privileges of peers of England, except the right to sit in parliament and on the trial of peers.

Down to the Restoration the English barons had no coronet, but wore crimson velvet caps turned up with ermine, and at an earlier date, scarlet caps turned up with white fur. Charles II. assigned to them for coronet a circlet of gold, having six large pearls set on it, of which four are seen in the cut, the cap being of crimson velvet guarded with ermine with a gold tassel. The mantle of state is scarlet, with two doublings of ermine. In 1665, when the coronets of the peers of Scotland were assimilated to those of England, a royal warrant extended the use of this coronet to Scottish lords of parliament.

Baron's Coronet.

Scottish barons (not lords) had in virtue of their charters of barony very extensive rights of jurisdiction, civil and criminal, including 'pit and gallows,' power over life and limb: the gallows-hill is still an object of interest near some baronial mansions. That jurisdiction might be exercised either by the baron himself or by his bailie. Act 20 Geo. II., chap. 43, reduced the jurisdiction of a baron in civil matters to the right of recovering from vassals and tenants the feu-duties and rents of their lands, and of compelling them to perform the services to which they were bound; he could also entertain civil questions generally when the amount did not exceed 40s. His criminal jurisdiction was at the same time restricted to the power of inflicting a fine of 20s. for assaults. This limited jurisdiction soon fell into desuetude. The same statute further provided that no future charter of barony should confer any higher jurisdiction than the power to recover rents, multures, and will services. Some Scottish peers of higher title sit in the House of Lords as barons of the United Kingdom; thus the Duke of Argyll sits as Baron Sundridge.

The judges in the Court of Exchequer (q.v.) were from a very early period called Barons of Exchequer. The name probably meant no more than *men*, chief men, of exchequer. The parliamentary representatives of the Cinque Ports (q.v.), who sat in the House of Commons till 1831, were also called barons.

In Germany, the term baron originally meant, as it did elsewhere, a tenant-in-chief of the crown; but its signification, instead of having become restricted, as in England, has become extended. The greater barons, or dynasty-barons, who had seats in the estates of the realm, were all in the earlier part of last century elevated to higher titles. Every descendant of the Knights of the Holy Roman Empire, who ranked among the lower nobility, now takes the style of baron; and a large number of those so designed are barons in virtue of a diploma from some reigning prince, the title being used by all the descendants of the patentee.

In France, very few barons belonging to the old *noblesse* remain; most of the titles of baron now enjoyed, date from the First Empire or the Restoration. A very few were creations of Louis-Philippe. French barons bear, by way of augmentation, a sinister canton in their arms.

Baron and Femme, or **FEME**, are Norman-French words, used in English law to denote Husband and Wife (q.v.). See also **MARRIAGE**. The words are also used in Heraldry to designate the bearing by which the arms of husband and wife

are carried per pale, or marshalled side by side on the same shield (the husband's being on the dexter side).

Baronet, a hereditary title which, etymologically signifying a little baron, seems to have originated in a misapprehension of the derivation of the word *Banneret* (q.v.), sometimes called in Latin *baronettus*. This dignity was instituted by James I. in 1611, avowedly for the defence of the new plantation of Ulster, but really to replenish the king's exchequer, and was bestowed by letters-patent. The recipient of it was to be a gentleman of coat-armour for at least three descents, with a clear revenue of £1000 from lands. His patent specified his precedence as before all knights, including Knights of the Bath, and such bannerets as were not made in the field in presence of the king: the style was given him of Baronet, and the prefix 'Sir' before his name, while his wife was to have a precedence corresponding to his own, with the style of 'Lady,' 'Madame,' or 'Dame.' Each baronet came under an obligation to maintain thirty soldiers in Ireland for three years, at the rate of 8d. per day for each, the wages of a year being paid into exchequer on the passing of the patent. The sum thus exacted, with the fees of honour due to the officers, exceeded £1000 on each patent. It was stipulated that the number of baronets should not exceed 200, and that on the extinction of a baronetcy, no other should be created to fill up the vacancy. The original baronets were among the most considerable landed gentlemen in England, the first being Sir Nicholas Bacon of Redgrave, Suffolk, Knight, whose patent is dated 22d May 1611, and whose descendant is still the premier baronet. All the original patents were granted to the recipient and the heirs-male of his body. King James never exceeded the 200, except by five creations in room of five baronets who were elevated to the peerage; but his successors disregarded the restriction, and the number became unlimited. The qualifications regarding birth, estate, &c. have not been rigidly adhered to

Fig. 1.

in later times, though it is still required that each baronet, before his patent be issued, shall be certified by the proper authorities to be a gentleman of coat-armour. In 1612 a dispute for precedence between baronets and the younger sons of viscounts and barons was decided by the king in favour of the latter; and it was at the same time directed that baronets might bear in their shield of arms, in a canton or inescutcheon, the arms of Ulster, argent, a sinister hand erect couped at the wrist gules—the 'bloody hand' (fig. 1). In the same year, the king knighted the heirs of the existing baronets, and ordained that the eldest sons of baronets might in future claim knighthood on attaining majority, a provision also set forth in the earlier patents, which, after falling into disuse, was recognised in three instances, in 1824, 1827, and 1835, but disallowed in the case of the eldest son of Sir James Broun, a Nova Scotia baronet, in 1836.

An order of baronets similar to that of England was instituted in Ireland in 1619, the arms of Ulster being also allowed them, and the money going to the Irish exchequer. The first baronet of Ireland was Sir Dominick Sarsfield, then Chief-justice of the Common Pleas in Ireland, whose patent was dated October 14, 1619.

The institution of the degree of baronet in Scotland, contemplated by James I., was carried out by his successor, the avowed object being to aid Sir William Alexander's scheme for the colonisation of Nova Scotia. The number was not to exceed

150; the sum payable was £3000, and the patents at first included grants of specified lands in that colony. As the lands conveyed and described had no actual existence, the grants were illusory; and the practice of including such grants in the patents continued down to 1638, though Nova Scotia had long before that date passed into the hands of the French. Baronets of Scotland are often called baronets of Nova Scotia; but the name can hardly be given with propriety to those created after 1638. The first creation was that of Sir Robert Gordon of Gordonstone, second son of Alexander, eleventh Earl of Sutherland, whose patent bore date 26th May 1625. The later creations of Charles I. included gentlemen unconnected with Scotland, and in one instance a lady, Dame Maria Bolles, of Osberton, Notts. In almost all patents by Charles I. the limitation was to heirs-male whomsoever; afterwards, though there was considerable variety, the most common limitation was to heirs-male of the body. It was at first provided that baronets of Scotland should charge their coat-armour with the arms, supporters, and crest of Nova Scotia on a canton or inescutcheon. In 1629 they became entitled to wear a personal decoration or badge pendent from an orange-tawny ribbon—viz. in an escutcheon argent, a saltire azure, thereon an inescutcheon of the arms of Scotland, an imperial crown above the escutcheon, and round the whole the motto, *Fax mentis honestæ gloria* (fig. 2). The wearing of this badge, having fallen into disuse after the Civil War, was revived at a meeting of the baronets of Scotland in 1775. In representations of the arms of a baronet of Scotland, it is usual to place this badge below the shield, hanging from an orange-tawny ribbon surrounding it.

Fig. 2.

No baronets of Scotland have been created since 1707, and of Ireland since 1801. Later baronets are of Great Britain or of the United Kingdom.

Baronets take rank immediately after the younger sons of barons; and it is usually understood that they take precedence among themselves, after the analogy of peers, as follows: Baronets of England; of Scotland; of Great Britain; of Ireland; of the United Kingdom. The Ulster King of Arms, however, contends that in the absence of any direct legislative provision to the above effect, baronets of all classes should rank only according to the dates of their patents.

Baronius, CÆSAR, a great Catholic ecclesiastical historian, born at Sora, in Naples, 30th August 1538. Coming to Rome at nineteen, he was one of the first pupils of St Philip Neri, and attached himself to his congregation of the Oratory, of which he afterwards became superior (1593). Here, by long and severe study, he laid the foundation of his fame. The immediate occasion of his great work was the necessity of replying to the Protestant historical work known as the *Magdeburg Centuries*. His object was to prove that the Church of Rome was identical in doctrine and constitution with the Christian Church of the 1st century. This he did in his *Annales Ecclesiastici a Christo nato ad annum 1198* (12 vols. 1588-93). Honours were now showered upon his head. He became confessor to the Pope, apostolical protonotary, cardinal in 1596, librarian of the Vatican Library, and would have been elected pope on the death of Clement VIII. in 1605 but

for the opposition of the Spaniards, who were indignant at him for his treatise, *Tractatus de Monarchia Siciliae* (in vol. xi. of his great history), in which he argued against Spain's claim to Sicily. He died June 30, 1607, and was canonized by Gregory XV. in 1622. The best edition of the *Annales* is that edited by Mansi (38 vols. Lucca, 1738-59), which contains Pagi's *Critica*. Odoricus Raynaldus wrote a continuation down to the year 1565 (9 vols. 1646-76). A new edition of the work, with the continuations of Raynaldus and others, is that of A. Theiner (37 vols., Bar le Duc, 1864-83), who himself wrote a continuation for the years 1572-85 (Rome, 3 vols. 1857). Amongst other works of Baronius, his publication of the *Martyrologium Romanum* deserves to be noticed (Rome, 1586, and often reprinted).

Baron of Beef, a large piece of beef, consisting of both sides of the back, or a double sirloin, and weighing, according to the size of the animal, from 50 to 100 lb. This monstrously large piece of beef, roasted, is served only on particular festive occasions at the English court, and at great public entertainments. When served according to ancient custom at civic feasts in Guildhall, London, the baron of beef is honoured with a distinguished place on a kind of elevated rostrum, where it is ceremoniously carved for the assembled guests. The derivation of the term is unknown.

Barons' War. See MONTFORT.

Barony is, or, it may rather be said, was a manorial and hereditary right arising out of land, known to the law both of England and Scotland. In England, manors were formerly called baronies. In the Scots law, a right of barony is a right in relation to lands which have been erected by a crown-charter making the grant *in liberam baroniam*. It involved a civil and criminal jurisdiction to which, in theory, all the inhabitants of the barony lands were amenable, but this was greatly reduced by the Heritable Jurisdictions Act passed after the Rebellion of 1745, and now exists only on the civil side for the purpose of recovering rents and duties, &c. The barons had also powers with reference to the trading privileges and municipal government of certain burghs, but trading privileges were abolished in 1847, and nearly all the older burghs have now adopted modern Police Acts (see BURGH). Baronial jurisdiction, however, is still permitted in villages on the sea-coast for encouragement of fisheries, and the bailies thereof (see BAILIE) have the powers of justices of the peace. In England, the lord or baron of the manor may hold his Court Baron (q.v.; see also MANOR). In Ireland, the barony is the largest subdivision of the county. The Baronial Session deals with the expenditure of the barony, subject, however, to the authority of the Presentment Sessions for the whole county. The Baronial Session consists of local justices of the peace and an arbitrary number of elected cesspayers.

Baroque (Portuguese *barroco*, 'a rough, irregular pearl'), originally a mere jewellers' term, but soon extended in sense, and applied in art to ornamental designs of an extravagant or incongruous character. The style followed the Renaissance in Italy, and was much in vogue from the middle of the 16th to the end of the 18th century. Aiming at surprises and general oddness, baroque depends entirely on the fancy and caprice of the architect, and, by means of over-accentuation and distortion of all straight lines, produces an effect often bold and ingenious, and sometimes picturesque, but always opposed to the established rules of art. Like Rococo (q.v.), the term baroque is often used to indicate bad taste somewhat generally.

Barosma. See BUCKU.

Barotse, a central branch of the Bantu family, in Africa, occupying the valley of the same name, on the Upper Zambesi. The Barotse valley is subject to inundations of the Zambesi, and is fertile, but little cultivated.

Barque, or BARK, a general name frequently given to small ships, square-sterned, without head-rails; but specially applied to a three-masted vessel whose mizzen-mast is 'fore-and-aft' rigged instead of being square-rigged, like the fore and main masts. These were formerly small vessels only, but now barques of over 3000 tons are frequently built. See SHIP, SAILS.

Barquisime'to, a town of Venezuela, the capital of a province of the same name, situated on an affluent of the Tocuyo River, in a fertile and healthy plain, about 1700 feet above sea-level. Founded in 1522, it became a flourishing town, but was destroyed in 1812 by a dreadful earthquake. Pop. (1881) 28,918.—Barquisimeto is also the name of one of the two sections of the great province of Lara, as divided in 1881; it has an area of 7375 sq. m., and a pop. (1881) of 176,079.

Barra, a small island of Inverness-shire, near the southern extremity of the Outer Hebrides, 42 miles W. of Ardnamurchan Point. It is 8 miles long, and 2 to 5 broad, with deep inlets of the sea; its area is 25 sq. m. A low sandy isthmus, over which the sea nearly breaks at high water, connects the two parts into which Barra is divided. The south or larger part contains a rocky mountain, 2000 feet high, and is divided into small valleys. The island is formed of gneiss. The soil is sandy, but sheep and cattle are fed on the hill and meadow pastures. Pop. (1841) 1977; (1861) 1591; (1881) 1869, Gaelic-speaking, and largely Catholic, and among the most industrious of Scottish fishermen. A lighthouse, built on Barra Head in 1833, is 690 feet above the sea, and is seen 33 miles off. Kismull Castle was the ancient seat of the M'Neills, who in 1840 sold the island to Colonel Gordon of Cluny.

Barra, a pleasant suburban town about 3 miles E. of Naples, with a pop. (1881) of 8464.

Barra, a petty Mandingo kingdom of Western Africa, near the mouth of the Gambia, with an estimated pop. of 200,000, the men being remarkable for their fine proportions. The surface, which is fertile, but rather marshy, is well cultivated. The territory about the mouth of the river belongs to the British, who have built the port of Albreda on the south bank, from which considerable trade is carried on. The chief town is Barrinding, where the so-called king resides.

Barrackpur, a native town and military cantonment, Bengal, on the E. bank of the Hooghly, and 15 miles up the stream from Calcutta. It is a favourite retreat for Europeans from Calcutta; and to the south is its park, containing the suburban residence of the Viceroy of India. Two sepoy mutinies have occurred here, the first in 1824, when a regiment of Bengal infantry refused to go for service in the Burmese war, again in the famous mutiny of 1857. Pop., with Nawabganj (1881) 17,702.

Barracks (originally derived through the Fr. *baraque*, from the Ital. *baracca*, or the Span. *barraca*) are permanent structures for the accommodation of soldiers, sailors, or police. Great opposition was made in this country to the introduction of permanent barracks during the early part of the last century, on the ground that the liberty of the subject might possibly be endangered by thus separating the soldiery so completely from the citizens, and placing them in the hands of the ruling power. On the other hand, it was contended that the older system of

billeting the soldiers on the people is vexatious and burdensome; and that the morals of towns-people and villagers are liable to be vitiated by the constant presence of soldiers. The permanent barracks were few in number down to the year 1792, when George III. obtained the consent of parliament for the construction of several new ones, and for the founding of the office of barrackmaster-general. Various changes in the arrangements were made from time to time. The expenditure for barracks, in building, rebuilding, enlarging, and repairing, between 1793 and 1804, was £4,100,000; between 1804 and 1819, £3,220,000; and between 1819 and 1859 (including Aldershot Barracks, q.v.), upwards of £7,000,000. The cost varied from £27 to £209 per soldier accommodated, according to the inclusion or exclusion of officers' quarters, &c. The barrackmaster-general was replaced at the beginning of this century by commissioners for barracks, whose functions were absorbed in 1822 by the now extinct Board of Ordnance. Barracks are now under the supervision of the Surveyor-general of the Ordnance, who provides for their construction and maintenance through the Royal Engineers; and for their victualling and daily service through the Commissariat Department, with barrack-clerks and barrack-sergeants to assist in these duties. Barrack furniture is bought by the War Office at a cost of 25s. per man, and repaired at the expense of the troops. The French have a singular plan of hiring such furniture at 15 francs per man per annum, which is in some respects a better arrangement. The barrack-rooms have arm and accoutrement racks, shelves, and pegs; with a regular order for depositing everything thereon. During the day, all the arms, clothing, bedding, dishes, and tins are placed in exact array, and the iron bedsteads are turned down only at night. A subaltern officer visits every room every day. One non-commissioned officer (sergeant or corporal) has control over each room, and is responsible for quiet, cleanliness, &c. Each soldier in a barrack has the use of an iron bedstead, a rug, a pailasse, a bolster, two blankets, and two sheets; his name and number are written near his bed, and his knapsack and arms placed behind its head.

Six per cent. of the men may marry, if of good character, and with the consent of their commanding officer. Their wives must be women of good character, and are accommodated, if possible, in separate rooms, known as 'Married Soldiers' Quarters.' If quarters are not provided, a married soldier may sleep out of barracks, and is then allowed an extra 2d. per day. The provision of separate rooms for married soldiers is one of the results of the committees of inquiry appointed in 1855 and 1857. It was then found that, out of 252 barracks, only 20 had separate sleeping-rooms for married soldiers; in the other 232 they shared the rooms of the single men, with mere screens round the portion allotted to them, or else slept away from barracks altogether.

Another result of the labours of the above-mentioned committees is the greatly improved hygienic condition of barracks in such matters as drainage, ventilation, means of ablution and recreation, circulation of air, &c., and, as a natural consequence, a greatly reduced rate of mortality. Army-physicians recommend 600 cubic feet of room-space per soldier; and this is provided for in all modern barracks. It has been estimated that a new barrack for 1000 footguards in London would cost £150,000, *besides land*, of which at least 20 acres would be required to provide space for drill-grounds, stores, hospital, offices, &c.

The finest existing barracks in this country are perhaps those at Aldershot (q.v.). The infantry barracks each form a spacious quadrangle, with a

court-yard in the centre, complete for a full battalion, with all the men's rooms at one end, and store-rooms, school-rooms, offices, married men's quarters, &c. on the other three sides. The officers' quarters are separate, and occupy open spaces between the barracks. The men's living and sleeping rooms, each for 24 men, are very large and airy; the washing-rooms are ample and well fitted; and the cooking-rooms will each cook for 350 men. These together form two blocks, each three stories high, connected by a glass roof, covering a drill-ground and the staircases, which communicate with broad balconies outside the rooms. The artillery and cavalry barracks resemble in their general features those for the infantry. The stables are under the men's rooms.

By the Military Forces Localisation Act of 1872, £3,500,000 was to be raised and expended in building and adapting barracks for the 70 regimental districts among which the infantry is now divided. By 1887 most of these had been completed, and are fine buildings. They are, when practicable, constructed to accommodate two battalions, one on each side of a spacious parade-ground, with all the necessary offices, and made, to a certain extent, defensible by being surrounded by a high loopholed wall.

Barrafranca, a town of Sicily, in the province of Caltanissetta, near the town of that name, with a pop. (1881) of 9052.

Barra Mansa, a town of Brazil, on the Parahiba, 70 miles NW. of the city of Rio de Janeiro. Pop. 5000.

Barranquilla, the principal port of the United States of Colombia, in the state of Bolivar, lies near the left bank of the main channel of the Magdalena, 15 miles distant from the sea. A railway runs to the coast; and recently the bar at the mouth of the river has been partially removed, so as to enable sea-going vessels to come up to Barranquilla, which possesses excellent wharfage accommodation. The inland traffic by river-steamers is important. The trade is mainly in the hands of Germans. Pop. about 20,000.

Barrantes, VICENTE, a Spanish writer, born at Badajoz, 29th March 1829. He early made a reputation by his dramatic pieces, political satires, stories, and ballads. In 1858 he entered the cortes, and in 1872 was elected to the Spanish Academy. Amongst his works are *Viaje a los Infernos*, a political satire, and an historical work on the Philippine Islands.

Barras, PAUL - JEAN - FRANÇOIS - NICOLAS, COMTE DE, a prominent figure in the French Revolution, was born June 30, 1755, at Fos-Emphoux in Var, of one of its oldest noble families. In his youth he served against the English in India, but soon returning home, plunged into a life of reckless dissipation at Paris. But he soon found worthier impulses in the fever of revolution. A member of the Jacobin Club from the outset, he represented Var in the National Convention, voted for the execution of the king without delay, and had a share in the downfall of the Girondists. He conducted the siege of Toulon, and suppressed, not without great cruelty, the revolt in the south of France. Hated by Robespierre as not decided enough, he attached himself to his opponents, and played the chief part in the tyrant's downfall, being appointed by the terrified Convention virtual dictator for the time. In this capacity he crushed the intrigues of the Terrorists with decision and vigour, and his humanity saved the reaction from being more bloody than was just. On subsequent occasions he acted with decision both against the intrigues of the Royalists and the excesses of the Jacobins; and on 13th Vendémiaire (5th October)

1795, being again appointed commander-in-chief by the Convention, he called his young friend Bonaparte to his aid, who crushed the insurgent sections, and assured his own future with the historical 'whiff of grape-shot.' The Directory being appointed in November 1795, Barras was nominated one of the five members. On 18th Fructidor (4th September) 1797, he was again made dictator, whereupon he removed his opponents, whom he accused of royalism, from both councils. From this time he guided the state almost alone, until his covetousness and love of pleasure had rendered him so unpopular that Bonaparte, with the help of Sièyes, was able to overthrow him easily on the 18th Brumaire (November 9) 1799. Compelled to remove from the neighbourhood of Paris, he resided in Brussels, then in Marseilles, but was banished to Rome, and thence sent to Montpellier, being kept under constant surveillance of the police, who actually found him to have been engaged in conspiracies for the bringing back of the Bourbons. After the Restoration he returned to Paris, and purchased an estate near the city with part of the great fortune he had acquired in the Revolution. He died 29th January 1829.

Barratry, COMMON, or *Barretry*, is the offence of inciting and stirring up suits and quarrels among the queen's subjects. It must be shown that the party accused *frequently*, or at least on more than one occasion, conducted himself in the way imputed. The term is probably the same as the French *baraterie*, which Littré derives from a root *barat* meaning 'fraud.' The punishment for this offence is fine and imprisonment; but if the offender belongs to the profession of the law, he may besides be disabled from practising his profession for the future. And, indeed, it is the existing statute law of England, that if any one who has been convicted of barratry shall practise as an attorney, solicitor, or agent in any suit, he may be kept in penal servitude for not more than seven or less than three years.

Akin to this offence is that of suing another in the name of a fictitious plaintiff. If committed in any of the superior courts, this offence is treated as a high contempt, punishable at discretion, and in inferior courts, by six months' imprisonment, and treble damages to the party injured.

Barratry, in the sense above explained, is not a technical term in the law of Scotland. But in that system there is a word *Baratry*, which is defined as the crime committed by a judge who is induced by a bribe to pronounce a judgment, or who barters justice for money.

There is also *Baratry of Mariners*, which signifies—in the law not only of England and Scotland, but also of France and other European states—the fraud or wrongful act of the master or mariners of a ship tending to the prejudice of the owners of the ship or cargo. Such conduct is one of those risks which are usually insured against in marine policies of insurance. See INSURANCE.

Barré, ISAAC, British soldier and politician, was born at Dublin in 1726. Gazetted as an ensign in 1746, he became friendly with General Wolfe, under whom he rose to the rank of lieutenant-colonel. He was wounded in the cheek at Quebec, was beside Wolfe when he fell, and figures in West's picture of 'The Death of Wolfe.' He entered parliament in 1761, and held office successively under Lord Bute, Pitt, Rockingham, and Lord Shelburne. In Pitt's second administration he exposed the corruptions of the ministry, was a strong opponent of Lord North's ministry, and opposed the taxation of America. He died in London, 20th July 1802.

Barrel, primarily a large vessel for holding liquids, next a *measure* for various wares and quantities. The barrel of ale and beer contains 36 imperial gallons. The barrel of herring contains about 800 herrings. *Barrel* also signifies a certain *weight* or other quantity of goods usually sold in casks called barrels; of salt meat, 200 lb.; butter (4 firkins), 224 lb.; soap, 256 lb.; gunpowder, 100 lb.; flour, 196 lb.; and raisins, 112 lb. In America, flour and beef are sold on the large scale in barrels: a barrel of flour must contain 196 lb.; of beef, 200 lb. A barrel of rice contains 600 lb.; of gunpowder, 25 lb.; of fish, salt meat, or bacon, 200 lb.

Barrel-organ, a mechanical organ whose music is produced by a barrel or cylinder, set with pins and staples, which, when driven round by the hand, opens the valves for admitting the wind to the pipes according to the notes of the music. The number of tunes that any one instrument can play is, of course, very limited. Barrel-organs are generally portable, and mostly used by street-musicians; though they were not unknown in English country churches in the latter half of the 19th century. The most perfect barrel-organs are those which are driven by a motive-power, of which the best are made in Vienna. A successor of the hurdy-gurdy, the barrel-organ itself has been largely superseded by the barrel-piano.

Barren Island, a small volcanic mass in the Bay of Bengal, lying east of the Andamans, about 94° E. long. It is conical in shape, about 8500 yards in diameter, and the volcano is active.

Barrenness. See STERILITY.

Barrhead, a town of Renfrewshire, 8½ miles SW. of Glasgow by rail. Founded about 1773, it has cotton-mills, and bleaching, dyeing, and print works. Pop. (1841) 3492; (1881) 7495.

Barricades, defence-works formed in streets and roads of beams, chains, *chevaux-de-frise*, and other obstacles, either to defend a town against besiegers, or to shelter insurgents. They have been used in street-fights since the middle ages, but are best known in connection with insurrections in the city of Paris. As early as 1358 its streets were barricaded against the Dauphin, afterwards Charles V. A more noteworthy barricade-fight was that in 1588, when 4000 Swiss soldiers, marched into Paris by Henry III. to overawe the Council of Sixteen, would have been utterly destroyed by the populace, firing from behind barricades, had the court not consented to negotiation. The next barricade-fight of importance in Paris was that of 1830. During the three days which this revolution lasted, the number of barricades erected across the streets amounted to several thousands. They were formed of the most heterogeneous materials—overturned vehicles, trees, scaffolding-poles, planks, building-materials, and street paving-stones—men, women, and children taking part in their erection. In February 1848, the insurrection against Louis-Philippe commenced with the erection of barricades; but the most celebrated and bloody barricade-fight was that between the populace and the Provisional Government, 23d–26th June 1848, which ended in the defeat of the people. The national losses by this fight were estimated at 30,000,000 francs; 16,000 persons were killed and wounded, and 8000 taken prisoners. Napoleon III. widened and macadamised many of the principal streets of Paris, partly with the express purpose of rendering the successful erection of barricades next to impossible; but in the second siege of Paris (1871), the Communists threw up numbers of strong barricades. There was a remarkable barricade-erection in London in 1821. The ministry desired that the body of Queen Caroline should be conveyed out of

the country to Germany, for interment, without the populace having the opportunity of making any demonstration. On the matter becoming known, a vast barricade was erected at the point where the Hampstead Road joins the New Road; and as nothing but the use of artillery could have forced the way, the officer in charge of the funeral cortege deemed it prudent to change his course, and pass through a more central part of the metropolis. During the revolutions of 1848 and 1849, barricades were successfully carried in Paris, Berlin, Vienna, and Dresden, by abandoning the attack in front, and breaking through the houses of contiguous streets, so as to take their defenders in the rear.

Barrier Act, the name commonly given to an act of the General Assembly of the Church of Scotland, 8th January 1697, intended as a barrier against innovations, and a security that changes in doctrine, worship, discipline, and government shall be deliberate and in accordance with the general mind of the church. It provides that no change can be made in the laws of the church without being submitted in the form of an overture by that General Assembly which first approves it, to the consideration of all the presbyteries, and approved by a majority of them; after which it still remains to be considered by the next General Assembly, which then may or may not pass it into a law. It does not apply to declaratory acts or to acts of administration. Analogous regulations have been adopted by other Presbyterian churches.

Barrière, JEAN FRANÇOIS, a French writer, born in 1786 and died in 1868. He edited, with Berville, the great storehouse of materials for history, the *Mémoires relatifs à la Révolution Française* (47 vols. 1822, et seq.); and alone, *Mémoires relatifs au XVIII^{ème} Siècle* (29 vols. 1846-64).—THÉODORE BARRIÈRE, an active French dramatist, born in 1823 at Paris, produced a long series of dramas, including *Filles de Marbre* (1854), *Les faux Bonhommes*, his masterpiece (1856), *Cendrillon*, and *Le Démon de Jeu* (1863). He died 16th October 1877.

Barrier Reef, an immense coral-reef extending along the N.E. coast of Australia for over 1000 miles, at a distance from the shore of from 10 to upwards of 100 miles. The reef is, in general, precipitous, and in many places rises out of great depths, lines of 280 fathoms having failed to reach the bottom on the outer side. Ignorance of its extent led to many shipwrecks; but it has now been surveyed and laid down on charts. In the course of its length there are several breaks or passages in it, only one, however, being safe for ships. It is marked by a lighthouse, and is called Raines Inlet.—The reefs called *barrier reefs* are one of the three characteristic kinds of coral formations, being distinguished both from *fringing* reefs and from *atolls*. See CORAL ISLANDS; also POLYNESIA.

Barring Out, a practice once common in schools, which consisted in the scholars fastening the doors against the master. The usual time for it was immediately prior to the vacations; and it seems to have been an understood rule that if the scholars could sustain a three days' siege, they were entitled to dictate terms regarding the number of holidays, hours of recreation, &c. for the ensuing year. If, on the other hand, the master succeeded in forcing an entry, the insurgents were entirely at his mercy. The masters, in most cases, appear to have acquiesced good-humouredly in the custom; but some chafed at it, and exerted their strength and ingenuity to storm or surprise the garrison. Addison, according to Johnson, was the leader of a barring out at Lichfield about the year 1686. One

remarkable and fatal case of barring out occurred at the High School, Edinburgh, in 1595. The town council refused to grant more than three of the eight holidays which the boys demanded as their privilege. They accordingly took advantage of the master's temporary absence to lay in a store of provisions, and having done so, barricaded the doors. The magistrates, the patrons of the school, in vain sought admission, the boys saying they would treat with their master only; and after a day and night had passed, it was resolved to force an entrance. The result was that one of them, Bailie Macmoran, was shot dead on the spot by a scholar named Sinclair. The statutes of Wotton School, Cheshire, founded by Sir John Deane in 1558, ordained that 'a week before Christmas and Easter, according to the old custom, the scholars bar and keep forth the school the schoolmaster, in such sort as other scholars do in great schools.' A barring out forms the theme of one of Miss Edgeworth's stories.

Barrington, GEORGE, pickpocket and author, was born in 1755 at Maynooth, Ireland, the son of a silversmith named Henry Waldron. In 1771 he ran away from school, and coming to London, turned pickpocket, on one occasion robbing Prince Orloff of a snuff-box, set with brilliants, valued at £30,000. Twice previously convicted, he was finally sentenced in 1790 to transportation to Botany Bay, but having on the voyage out frustrated a conspiracy amongst the convicts, he was emancipated in 1792. He became superintendent of the convicts, and high constable of Paramatta, New South Wales, where he died at a great age. His prologue, written for Young's tragedy, *The Revenge*, at its representation by convicts at the opening of a theatre at Sydney, January 16, 1796, is too witty to be forgotten:

From distant climes, o'er widespread seas, we come,
Though not with much *éclat* or beat of drum;
True patriots we, for be it understood,
We left our country for our country's good.
No private views disgraced our generous zeal,
What urged our travels was our country's weal;
And none will doubt, but that our emigration
Has proved most useful to the British nation.

He was author of *A Voyage to Botany Bay* (1801), *The History of New South Wales* (1802), and *The History of New Holland* (1808).

Barrington, (1) JOHN SHUTE, 1st VISCOUNT BARRINGTON, the son of a London merchant, was born in 1678, and called to the bar in 1699. In 1704-5 he published his *Rights of Protestant Dissenters*, which gained him the confidence of the Presbyterians. His *Dissuasive from Jacobitism* (1713) recommended him to George I., and he was raised to the Irish peerage as baron and viscount in 1720. He was returned for Berwick in 1715, and again in 1722, but was expelled from the House of Commons in 1723 on account of his connection with a bubble speculation of the time. This excessive punishment was generally ascribed to the malice of Walpole. He died in 1734. His works, mostly theological, were published in 3 vols. in 1828. Of his six sons, the following deserve notice.—(2) WILLIAM WILDMAN, 2d VISCOUNT, his eldest son, born in 1717, sat for Berwick-upon-Tweed in 1740, and until 1778 constantly held office, either in the Admiralty, the War Office, the Exchequer, or the Post-office. He died in 1793.—(3) DAINES, the fourth son, born in 1727, was called to the bar, where he attained a considerable position. His numerous writings embrace law, antiquities, and natural history, but his only important work is his *Observations on the Statutes* (1766). He died in 1800.—(4) SAMUEL, a distinguished naval officer, was the fifth son. In 1787 he was made admiral, and he died in 1800.—(5) SHUTE,

the youngest son, was born in 1734, ordained in 1756, and became successively Bishop of Llandaff, of Salisbury, and (1791) of Durham. He died in London in 1826.

Barringtoniaceæ. See MYRTACEÆ.

Barrique, an old French wine-measure. The barrique of Bordeaux was equal to 228 litres.

Barrister is the distinctive name by which the advocates or pleaders at the English and Irish bars are known; and thus its derivation is perhaps sufficiently accounted for. They are admitted to their office under the rules and regulations of the Inns of Court (q.v.), and they are entitled to exclusive audience in all the superior courts of law and equity, and generally in all courts, civil and criminal, presided over by a superior judge. In the whole of the county courts solicitors are allowed to practise without the assistance of counsel; also at petty sessions, though at the quarter sessions where four counsel attend, the justices always give them exclusive audience (see SOLICITORS).

Barristers were first styled *Apprentices*, who answered to the bachelors of the universities, as the state and degree of a serjeant did to that of a doctor. These apprentices or barristers seem to have been first appointed by an ordinance of King Edward I. in parliament, in the twentieth year of his reign (Stephen's *Commentaries*, and authorities there referred to). Of barristers, there are various ranks and degrees, and among each other they take precedence accordingly; the general name, 'counsel,' being, in the practice of the court, common to them all. But they may be divided into two groups—barristers and Queen's Counsel. (The ancient order of *serjeants-at-law*, formerly a well-marked third group, was distinguished by the *coif* and other peculiarities, but has now ceased to exist. See *SERJEANT-AT-LAW*). *Barristers* simply, or utter barristers, occupy the position of junior counsel, wearing a plain stuff-gown and a short wig; *King's or Queen's Counsel*, or His (or Her) Majesty's Counsel learned in the law, as they are more formally called, are selected from the outer or junior bar. They are the leaders of the bar, and are distinguished by a silk gown; on state occasions, and always in the House of Lords, they wear a full-bottomed wig. For further details, see *KING'S COUNSEL*. Besides these three orders, the crown sometimes grants letters-patent of precedence, whereby the grantee is entitled to such precedence as may be assigned to him (see *PRECEDENCE*).

Barristers have exclusive audience in all the superior courts, where upon terms and conditions, and according to an etiquette, which are all well understood, they take upon themselves the protection and defence of any suitor, whether plaintiff or defendant. With the *Brief* (q.v.), or other instructions, barristers receive a *fee*, or such fee is indorsed on the brief or instructions, and afterwards paid. Such, generally, is the existing practice at the English bar, differing in this respect from the practice of the bar in Scotland—and, we believe, to a great extent in Ireland also—where prepayment of the fee is the rigid etiquette. The barrister's fee is not a matter of express contract or stipulation, recoverable at law like a solicitor's bill of costs, but is regarded as a mere honorary reward—*quiddam honorarium*, as it is called in law-books. There is therefore no means of enforcing its payment; but where it can be proved that the client or party gave money to the solicitor with which to fee the counsel, the latter may maintain an action against the former for the amount in some special cases.

In order to encourage due freedom of speech in

the lawful defence of their clients, and at the same time to give a check to unseemly licentiousness, it has been held that a counsel is not answerable for any matter by him spoken, relative to the cause in hand, and suggested in his client's instructions, although it should reflect upon the reputation of another, and even prove absolutely groundless (though the publication of the counsel's statement by a *third party* may expose such third party to an action); but if he mentions an untruth of his own invention, or even upon instructions, if it be impertinent to the cause in hand, he is then liable to an action from the party injured; and counsel guilty of deceit or collusion are punishable by the statute Westm. I. (3 Edw. I. chap. 29) with imprisonment for a year and a day, and perpetual silence in the courts—a punishment which may be inflicted for gross misdemeanours in practice, although the course usually resorted to is for the Benchers of the Inn of Court to which the person so offending belongs, to *disbar* him (see *INNS OF COURT, DISBAR*).

Besides advocacy and forensic disputation, barristers in England advise on the law by giving an opinion on a case stated—'opinion of counsel'; they also draw or prepare the pleadings or statements of fact on which an action is founded; and they prepare or revise the drafts of deeds and other instruments and of private bills (see the article *CONVEYANCING*). As a correlative privilege of the position in which they stand in respect of their fees, barristers are not personally liable for the injurious consequences of any erroneous advice they may give; and they claim absolute control over the conduct of all litigation in which they may be engaged, even to withdrawing it from court, unless the client expressly dissent; and until lately, it was the opinion of the profession that counsel might at any time, during the progress of a cause, compromise the matter in dispute; but the exercise of such discretion has been successfully opposed, and it is now admitted that barristers have no *ex officio* privilege beyond the guidance and conduct of actual litigation in court.

It is from the body of barristers that all the judges in England, superior and inferior, are appointed; and barristers are also always chosen for the office of paid magistrate. The only exception to the exclusive appointment of barristers to judicial offices is the case of justices of the peace (see *QUARTER SESSIONS*).

The bar in Ireland stands on the same footing, and has the same ranks and degrees, and is subject very much to the same rules and regulations, as the English bar; and in that country, barrister also is the name by which the profession of an advocate is distinguished. In Scotland, the same office is simply called by its own name of *Advocate* (see *ADVOCATES, FACULTY OF*).

At the bar of the House of Lords, and before parliament generally, before the privy-council, and also, it is believed, in all trials for high treason, whether in England, Ireland, or Scotland, the three bars rank on a footing of equality, taking precedence according to the date of their call and admission to their own respective bars, with the exception of King's Counsel. In Scotland, the latter are next in precedence to the Lord Advocate (see *ADVOCATE, LORD*), the Solicitor-general of Scotland (q.v.), and the Dean of the Faculty of Advocates. It was at one time disputed between the Lord Advocate of Scotland and the Attorney-general of England, which of them should lead the other at the bar of the House of Lords; and a struggle for precedence occurred in 1834 in the House of Lords, before Lord Chancellor Brougham, between Lord Chancellor Campbell as Attorney-general, and Lord Jeffrey as Lord Advocate. The

latter contended that as he was not only the first law-officer of the crown in Scotland, but also a high political officer, he was entitled to lead the former. But the House decided that the Attorney-general of England has precedence over the Lord Advocate of Scotland, in all matters in which they may appear as counsel at their lordships' bar. The relative rank of the *Irish* law-officers to English is the same. It only remains to add, that as the three bars are on a footing of equality in the House of Lords, and before the other imperial tribunals above mentioned, the English bar have no exclusive audience in these, even in English cases.

Revising Barrister is a barrister appointed annually by the English judges to revise the lists and settle who are the persons entitled to vote for members of parliament. For this purpose, all England is subdivided into districts, and a barrister is appointed for each district by the judges of assize. Though the appointment is only for one year, the same person is usually reappointed for a series of years. The barrister must be of seven years' standing at least. The revision of the lists takes place generally between August and October of each year. The powers and duties of the revising barrister are defined by the Registration Act of 1878. There is an appeal from his decision to the Queen's Bench Division of the High Court of Justice.—Similar duties are performed in Scotland by the sheriff-substitute.

Barros, João de, the most distinguished of Portuguese historians, was born at Vizeu in 1496, and died in 1570. He wrote an historical romance which attracted much admiration, and in 1522 he was appointed governor of the Portuguese settlements in Guinea, in 1532 treasurer of the Indies. Hereupon the king assigned him the task of writing the history of the Portuguese in India, which he undertook. But only the first four decades, down to 1526, proceeded from his pen, under the title of *Asia Portuguesa*; the continuation was the work of Diego de Couto.

Barro'sa, a village of Spain, 16 miles SSE. of Cadiz, celebrated in history as the place where General Graham (afterwards Lord Lynedoch), March 5, 1811, with a handful of English troops, succeeded in gaining a glorious victory over the French.

Barrot, Camille Hyacinthe Odilon, a prominent French statesman, born at Villefort, Lozère, 19th July 1791. At nineteen he pleaded before the ordinary tribunals, and at twenty-three, by a special dispensation, before the Court of Cassation, Paris, and early acquired a high reputation for eloquence. In the political arena also, his oratory soon made him one of the most influential leaders of the liberal opposition. He became president of the 'Aide-toi' Society in 1830, and at the July revolution in that year, was one of the three commissioners appointed to conduct the dethroned Charles X. to Cherbourg, on his way to England. On his return he was appointed prefect of the department of the Seine, and member of the Council of State, but in a few months resigned his offices to lead the opposition to Casimir Périer and the reactionary ministers who followed him. He supported Thiers from his accession to office in March 1840 to his fall in October, when he resumed his opposition to the ministry of Guizot. He took a conspicuous part in the reform movement of 1847, and spoke eloquently at several of the provincial reform banquets which led to the revolution of February 1848. Made president by Thiers in his short-lived ministry, he advised the king to withdraw his troops and thus remove the last obstacle to the downfall of his throne. In the last sitting of the

Chamber of Deputies, he supported the claim of the Count de Paris to the throne, and the regency of the Duchess of Orleans. The February revolution considerably abated his ardour for public liberty. He held office for some time under the presidency of Louis Napoleon, but retired from active political life after the *coup d'état*, 2d December 1851. In July 1872 he was made a councillor of state and vice-president of the council; but he died at Bougival, near Paris, 6th August 1873. His *Mémoires Posthumes* appeared at Paris (4 vols. 1875-76).

Barrow, a sepulchral mound of earth or stones raised over the site of a burial as a mark of honour to the dead. The barrows of the Stone Age in Europe are mostly constructions of stones, oblong, oval, or circular on the ground-plan, and containing chambers for the reception of the burials. A passage opening from the exterior gives access to the chamber, which is usually situated at or near the centre of the barrow. The chambered barrows, which are peculiar to the Stone Age of Britain, are

Plan of Chambered Barrow or Cairn, at Garrywhin, Caithness.

now structureless heaps in external appearance, but were originally faced with dry-walling on the external outline of the ground-plan. The oblong variety is occasionally from 200 to 300 feet in length, and sometimes contains several chambers. Commonly, however, the chamber is situated at one end of the barrow, which in many cases faces the east, and is usually higher than the other end. The passage leading into the chamber starts from between two concave or convex projections of the end of the barrow. It is commonly low and narrow towards the exterior, increasing in height and width as it approaches the chamber. The framework, so to speak, of the chamber and passage is commonly constructed of very large stones, and hence these chambers are often referred to as *megalithic*, and the framework of such a chamber, whether covered with a mass of smaller stones and earth, or uncovered, is called a *dolmen*, and often, erroneously, a *cromlech*. The passages are usually lintelled over with great flat stones, but the roof of the chamber is constructed of beehive vaulting (see BEEHIVE HOUSES). The chamber is often divided into compartments by partitions of slabs, or has smaller chambers opening from its sides. The burials in the chambered barrows are mostly after cremation, accompanied by urns of dark-coloured, hard-baked paste, with rounded or hemispherical bottoms.

The oval and circular barrows with internal chambers are smaller, and probably later than the long barrows. They also have their external outline defined by dry-walling, and are sometimes surrounded by a trench, or by a ring-fence of standing stones. The mode of burial is the same as in the long barrows, chiefly after cremation, accompanied by urns of the same character, and by implements, weapons, and ornaments of stone and bone. Indications of funeral feasts occur in all the chambered barrows, the deposits being intermixed with bones of the domestic animals—the horse, ox, dog, sheep, swine, and occasionally the red-deer, and various species of fish and fowl. The chambered barrows of Brittany and Denmark differ from those of Britain in having their chambers flat-roofed, often with a single stone of enormous size.

The barrows of the Bronze Age in Europe are circular in form and unchambered. They are characterised by single burials, placed in cists, or simple inclosures of flat stones, like chests, the sides, ends, and cover each formed of a single slab. A barrow may contain one or many cists, but the principal burial is usually near the centre. The cists may be placed on the original surface, or at some depth beneath it. The burials in them are commonly burnt, but often unburnt, this varying with the locality. Both burnt and unburnt interments may be accompanied by urns, but occasionally no urn is present. Sometimes a barrow may contain no cists, but simply deposits of burnt bones inclosed in large cinerary urns set in the soil, or with the urns inverted over them. The urns associated with burnt burial differ in form and purpose from those usually found with unburnt burial. The cinerary urn in Britain is large and wide-mouthed, and ornamented only on the upper part. The urns set in the cists with unburnt bodies are of two varieties—one somewhat bowl-shaped, tapering to a narrow base, nearly as wide as it is high; and the other tall, thin-lipped, and bulging below. Both varieties are usually ornamented over the whole surface.

The barrows of the Iron Age in Europe are mostly earthen mounds. In Britain they are few in number. The Anglo-Saxon burial-places of the heathen time are often cemeteries of graves undistinguished by barrows or mounds upon the surface. In Scandinavia, some of the larger barrows have chambers constructed of timber, but without passages. Such was the barrow of Queen Thyra at Jellinge, in Jutland, erected in the 10th century. The three great mounds or barrows at Upsala, in Sweden, contained burnt burials of the early Iron Age. In the later 'Viking time,' unburnt burial was the common practice. Some of the larger Viking barrows contained the ship, fully equipped as she rode the sea, and the owner laid in state in a house constructed on the deck, as in the case of the Viking ship discovered in 1880 at Gokstad Sandefjord, and now in the museum at Christiania.

The erection of barrows as marks of distinction in burial appears to have been a common custom among the early races, whether of high or of low culture and civilisation. It is repeatedly referred to in the Homeric poems. The barrows raised over the burnt bones of Hector and of Achilles and Patroclus are described as constructed of stones and earth, like those of prehistoric times, but unchambered. Herodotus describes the Scythian custom of barrow-burial as existing in his time; and in the case of the barrow raised over Hephæstion, the friend of Alexander the Great, we have the cost of its construction stated at 1200 talents, which has been computed as equivalent to something like £232,500 sterling. See Canon Greenwell's *British Barrows* (Oxford, Clarendon Press, 1877), and other works cited at ARCHÆOLOGY; also BURIAL.

Barrow, a term applied to three prominent localities of the Arctic Ocean, in honour of Sir John Barrow.—(1) *Point Barrow*, on the northern coast of Alaska, in 71° 23' N. lat. and 156° 31' W. long., long received as the most northerly spot on the American mainland (but see BELLOT STRAIT, BOOTHIA).—(2) *Cape Barrow*, on the northern coast of Canada, or Coronation Gulf, 68° N. lat., 111° W. long.—(3) *Barrow Strait*, the earliest of Parry's discoveries, leading to the west out of Lancaster Sound, which Parry's immediate predecessor, Captain, afterwards Sir John Ross, had pronounced to be landlocked in that direction. Besides its main course to Melville Sound, Barrow Strait throws off Prince Regent's Inlet to the south, and Wellington Channel to the north. The passage averages about 50 miles in breadth, extending pretty nearly along the parallel of 74° N., from 85° to 100° W.

Barrow, a river in the south-east of Ireland. Of the Irish rivers, it is in importance next to the Shannon. It rises in the north of Queen's County, on the north-east slope of the Slieve Bloom ridge of mountains. It flows first east past Portarlington to the border of County Kildare, and then southward, passing the towns of Athy, Carlow, and New Ross. It has a course of 100 miles through a carboniferous, granitic, and silurian basin. Two miles above New Ross it receives the Nore, and 8 miles east of Waterford, it is joined by the Suir (q.v.). These three rivers (called the Three Sisters) form, near the sea, the large and secure estuary of Waterford harbour, 9 miles long. The Barrow is navigable for ships of 300 tons to New Ross, 25 miles up, and for barges to Athy, 65 miles up, whence the Grand Canal communicates with Dublin.

Barrow, ISAAC, a mathematician and divine, was born in 1630 in London, where his father was linen-draper to Charles I. At the Charterhouse he was chiefly distinguished for pugnacity; but at Felstead, in Essex, his next school, he greatly improved; and in 1643 he was entered at Peterhouse, Cambridge, under his uncle, Isaac Barrow, then a fellow of that college, and finally Bishop of St Asaph. In 1645, before he had come into residence, his uncle was ejected; so he went instead to Trinity College, where he became B.A. in 1648, fellow in 1649, and M.A. in 1652. Finding that to be a good theologian he must know chronology, that chronology implies astronomy, and astronomy mathematics, he applied himself to the latter science with distinguished success. To the classics he had already devoted much study, and on the vacancy of the Greek chair (1654), he was recommended for the office; but a suspicion of Arminianism is said to have interfered with his success. After this disappointment he went abroad (1655), and travelled four years through France and Italy, to Smyrna and Constantinople, back to Venice, and home through Germany and Holland. On the voyage from Leghorn to Smyrna, his determined personal courage seems to have been instrumental in scaring away an Algerine pirate, after a brisk exchange of shots. Soon after his return he took orders (1659), and in the following year was appointed professor of Greek. In 1662 he received the chair of Geometry at Gresham College, London, which, on his appointment to the Lucasian professorship of Mathematics at Cambridge (1663), he thought it his duty to resign. The latter also he resigned in 1669, in favour of his pupil Isaac Newton. On quitting his professorship, he obtained from his uncle a small sinecure in Wales, and from Dr Seth Ward, Bishop of Salisbury, a prebend in that cathedral. He devoted the revenues of both to charitable purposes, and resigned them in 1672, on being appointed by the king Master of Trinity College. To him, while in this office, is

due the foundation of the Trinity library, which is one of the chief ornaments of Cambridge. In 1675 he was nominated vice-chancellor of the university; in 1677 he died on a visit to London, and was buried in Westminster Abbey. He was only 47, but by his writings and the force of his personal character, he had achieved a reputation which time has left unimpaired. Of his mathematical works, the principal are his *Lectiones Geometricæ* and *Lectiones Opticæ*, on which his contemporary fame was chiefly based, and which show him as an immediate precursor of Newton and Leibnitz. As a theologian, his fame rests mainly on his posthumous *Treatise on the Pope's Supremacy*, and on his eloquent sermons, unmatched as specimens of clear, exhaustive, vigorous discussion. Their length, we may add, was excessive. One, on charity, lasted three hours and a half; and at Westminster Abbey, he once detained the audience so long that they got the organ to play 'till they had blown him down.' Far the best edition of Barrow's English theological works is that by the Rev. A. Napier (9 vols. Camb. 1859), with a memoir by Dr Whewell, who in 1860 also edited his Latin mathematical works, some of which have been translated.

Barrow, SIR JOHN, was born of humble parentage at Drayley Beck, Lancashire, in 1764, and educated at Ulverston. Having for three years been timekeeper in a Liverpool iron-foundry, he made a voyage (1781) on a Greenland whaler, and after his return taught mathematics in a school at Greenwich. In 1792 he received the post of private secretary to Lord Macartney, ambassador to China; and he availed himself of his residence in China to learn the Chinese language, and to collect valuable materials, which he afterwards gave to the world, partly in articles in the *Quarterly Review*, and partly in his *Travels in China* (1804). When in 1797 Lord Macartney became governor of Cape Colony, Barrow made extensive excursions in the interior, which he described in his still valuable *Travels in Southern Africa* (1803). In 1804 he was appointed by Lord Melville secretary to the Admiralty, which situation he retained till 1845, except for a short time in 1806. Barrow also published *A Voyage to Cochin-China* (1806), *The Life of Macartney* (1807), *A Chronological History of Voyages into the Arctic Regions* (1818), *Voyages of Arctic Discovery* (1846), besides a series of lives of naval worthies. Under Peel's ministry, in 1835, he received a baronetcy. In 1845 he retired from public service, and he died in London, 23d November 1848. He rendered signal service to geographical science by suggesting and promoting Arctic expeditions; and Barrow Strait, Cape Barrow, and Point Barrow preserve his memory. He may also be claimed as the founder of the Geographical Society (1830), of which he was vice-president till his death. See his *Autobiography* (1847), and the *Memoir by Staunton* (1852).

Barrow-in-Furness, a seaport and manufacturing town of North Lancashire, situated on the south-western coast of the peninsula of Furness, opposite a small island called Barrow Island, which is traditionally reported to have been in former times a burial-place of Norse rovers. By rail it is 36 miles WNW. of Lancaster, and 268 NNW. of London. In 1847 it was a fishing-village of 325 inhabitants; in 1864 the population had risen to 10,608, in 1871 to 18,245, in 1881 to 47,111, and in 1891 to 51,712. This rapid increase, matched in Great Britain by only Birkenhead and Middlesbrough, is owing to Mr H. W. Schneider's discovery in 1840 of extensive deposits of rich hematite ore at Park, near Barrow; to the establishment both of mines and smelting-works; and to the opening of railway communication through-

out the district, the Furness Railway Company having constructed 108 miles of line during 1846-47. In 1859 smelting-works were established which soon gave employment to a great number of men, and converted the old fishing-village into a prosperous town. In 1866 these iron-works were amalgamated with the Bessemer Steel Company, founded three years before, as the Barrow Hematite Iron and Steel Company, which, in 1887, had 14 blast-furnaces in operation, and turning out a yearly output of 360,000 tons of pig-iron and 220,000 tons of Bessemer steel. Copper also is obtained in considerable quantity in the neighbourhood; whilst some 20,000 tons of slate are annually quarried and sent by coasters or by rail to other parts of Great Britain.

The town is built on a regular plan, mostly in rectangles, with broad, regular streets, which are traversed by steam tram-cars. It is, of course, wholly modern; and to give some idea of its rapid extension, we may mention that eight new board schools, with accommodation for 3822 children, were opened during 1875-77; and that in 1878 four new Anglican churches were consecrated on the same day, besides three built between 1865 and 1871. In 1872 a statue was unveiled of the first mayor, Sir James Ramsden, and in 1885 one of Lord Frederick Cavendish. The great ornament of the place is the town-hall, built in 1887 at a cost of £80,000.

The Dukes of Devonshire and Buccleuch are the principal landowners of the town and neighbourhood. They have given name to the first two docks, which, together covering 66 acres, were opened by Mr Gladstone in 1867. The Ramsden and the Cavendish Dock (1877) cover a respective area of 78 and 200 acres, and, like their predecessors, are 24 feet deep. Barrow Island has since 1871 become the seat of great iron shipbuilding yards, which turn out vessels of from 20 to 8300 tons, and which, in full work, employ 5000 hands. Huge flax and jute-works were erected in 1872 by the great capitalists of Barrow to provide employment for women and girls, 1800 of whom find constant work. There are besides engineering works (1866), a great steam-mill (1871), furnace-building works, and iron-founding, brewing, boiler-making, &c. Its foreign trade is increasing; the imports including timber (since 1866) from Sweden and Canada, coal from Wales, and preserved provisions from New York. The chief exports are ore, steel rails, and pig-iron. Steamers ply regularly between Belfast, Glasgow, and Douglas, Isle of Man. The interesting ruins of Furness Abbey lie within 2 miles of the town; while on Piel Island there are the ruins of a castle built by the Abbot of Furness. From the excellence of the harbour, the abundant facilities of railway conveyance, and the mineral wealth of the district, it may confidently be expected that Barrow-in-Furness will still rapidly increase in importance. It was made a municipal borough in 1867; and since the Distribution of Seats Act (1885), it has returned one member to parliament. See J. Richardson's *Furness Past and Present* (Barrow, 1880).

Barry, a small island in the Bristol Channel, off the south coast of Glamorganshire, 12 miles SW. of Cardiff. It has the ruins of an ancient castle and of two chapels.

Barry, COMTESSE DU. See DU BARRY.

Barry, SIR CHARLES, R.A., architect, was born at Westminster in 1795, and educated at private schools in Leicestershire and Bedfordshire. In 1810 he was indentured to a firm of Lambeth surveyors; in 1817 he went to Italy. A wealthy countryman of his own, attracted by the beauty of his drawings, took him with him to the East as his companion, defraying his expenses. Returning to England in

1820, he three years later became the successful competitor for the design of a church at Brighton. He was also the architect of the Manchester Athenæum, a building in the Grecian style; and of the Grammar-school of King Edward VI. at Birmingham; the latter esteemed the most beautiful of his works. In London, he designed the Travellers' Club and the Reform Club, both in Pall Mall, and the College of Surgeons, Lincoln's Inn Fields. After the burning of the old Houses of Parliament in 1834, on a public competition Barry's design for the new building was adjudged the best. The work was commenced in 1840; and on 3d February 1852, Her Majesty opened the Victoria Tower and Royal Gallery in state, and on the occasion knighted the architect. Chosen a Royal Academician in 1841, Sir Charles was also a Fellow of the Royal Society, of the Society of Arts, &c. He died at Clapham, May 12, 1860, and was buried in Westminster Abbey. See WESTMINSTER, and the Life by his son, Bishop Barry (1867).

Barry, JAMES, an historical painter, born at Cork, October 11, 1741. He was a protégé of Edmund Burke, through whose liberality he studied for about four years in Italy (1766-70). On his return he was chosen a member of the Royal Academy, and in 1782 professor of Painting. He was of irritable temper, quarrelled with the Royal Academy, and was expelled. He died in poverty on 22d February 1806. His *chef-d'œuvre* is the 'Victors at Olympia,' one of six paintings to ornament the room of the Society of Arts. See J. Conyns Carr's *Papers on Art* (1885).

Barry, MARTIN, a physiologist of eminence, was born at Fratton, Hampshire, in 1802. He studied at the medical schools of London, and at several on the Continent, and took his degree of M.D. in Edinburgh in 1833. He wrote much on physiological subjects, and especially on animal development and embryology. He was elected a member of the Royal Society in 1840. In 1844 he was appointed house-surgeon to the Royal Maternity Hospital, Edinburgh. His means being ample, he gave his professional services largely to the poor. In 1853 he settled at Beccles, in Suffolk, where he died in April 1855.

Barry, in Heraldry, the term applied to a shield which is divided transversely into four, six, or more equal parts, the tinctures of which are interchangeably disposed.

Barry.

Barry-bendy.

Barry-pily.

Barry-bendy is where the shield is divided into four, six, or more equal parts, by diagonal lines, the tincture of which it consists being varied interchangeably.

Barry-pily is where the shield is divided into an even number of pieces by piles placed horizontally across it.

Barry Cornwall. See PROCTER (BRYAN WALLER).

Bar-sur-Aube, a small town of France, in the department of Aube, situated on the right bank of the river of that name, 137 miles ESE. of Paris by rail. It has a pop. of 5000, employed in weaving and the manufacture of brandy. Here a council of the allied sovereigns was held in February 25, 1814; and here, two days after, the French were defeated by the allies.

Bar-sur-Seine, an ancient town of France, in the department of Aube, pleasantly situated on the left bank of the Seine, 21 miles SE. of Troyes by rail. Dyeing, and the manufacture of paper and brandy, are its industries. Pop. 3000.

Bartas, GUILLAUME DE SALLUSTE DU, soldier, diplomatist, and man of letters, was born at Montfort, in Armagnac, in 1544, and died in 1590 of wounds received at the battle of Ivry. His chief poem, *La Sepmaine*, gives an account of the creation, and is said to have had a considerable influence on Milton's *Paradise Lost*. Thirty editions of the work passed through the press in six years. Joshua Sylvester (1563-1618) Englished *Du Bartas his Divine Weeks and Works* (1598).

Barter, in commerce and political economy, a term used to express the exchange of one commodity for another, as contrasted with the sale of commodities for money. It is simply a primitive form of exchange carried on in countries in which the use of money has not yet been introduced or is not prevalent. It was an economic stage through which all communities must have passed. Even yet in many rude countries barter is very common; and European travellers find it convenient to take with them weapons, tools, and ornaments to exchange with the natives for their commodities. In civilised communities barter is a very exceptional thing, having been superseded by the use of money in various forms.

In law, barter, or exchange, as it is now more generally called in law-books, is a contract for transferring property, the consideration being some other commodity; or it may be described as a contract for the exchange of two subjects or commodities. It thus differs from *sale*, which is a contract for the transference of property in consideration of a price in *money*. See EXCHANGE; SALE OF GOODS.

Bartfa, or **Bartfeld**, a small but very old free town of North Hungary, on the river Topla, near the borders of Galicia. Its hot baths have properties like those at Spa. Pop. 5000.

Barth, a seaport town of Prussia, 21 miles W. of Stralsund, at the mouth of the Barth, which forms its harbour. Pop. (1885) 5714.

Barth, HEINRICH, one of the greatest modern scientific travellers, was born at Hamburg, 16th February 1821. He studied at Berlin, and, after visiting Italy and Sicily, in 1845 passed over to Tangier in Africa, and made excursions into the interior, to Tunis, Tripoli, and Bengazi. On his journey thence to Cairo, he was attacked, wounded, and plundered by a band of Arab robbers. He afterwards extended his researches into Egypt, Sinai, Palestine, Asia Minor, and Greece. An account of part of these travels appears in his *Wanderungen durch die Küstenländer des Mittelmeeres* (1849). He was next appointed by the British government, along with Dr Overweg, scientific companion to Mr James Richardson, at that time charged with a political and commercial mission to Central Africa. Starting from Tripoli early in 1850, Dr Barth and his companions crossed the Great Desert amid many difficulties and dangers. Barth soon separated from his friends, who both succumbed to the climate, and continued his explorations, which extended from Tripoli in the north to Adamáwa in the south, and from Bagirmi in the east to Timbuktu in the west, upwards of 12,000 miles. The result of his researches appeared in his *Travels and Discoveries in Central Africa*, 5 vols. (1857-58). Afterwards he made several journeys in Greece, Turkey, and Asia Minor. He died at Berlin, November 25, 1865. In 1858 appeared a book on his travels in Asia Minor, and in 1862-66 his great

work on the vocabularies of the Central African tribes.

Barth, or BART, JEAN, a French naval hero, the son of a fisherman, born in 1651 at Dunkirk, served first in the Dutch navy under De Ruyter, but on the commencement of the war with Holland passed over to the French service. As his humble birth made promotion hopeless, he became captain of a privateer, and distinguished himself so greatly that Louis XIV. at last appointed him lieutenant of a man-of-war. In 1691 he commanded a small squadron in the North Sea, where he destroyed many English vessels, and made a descent on the coast near Newcastle. In 1694, after a desperate struggle with a superior Dutch fleet, he recaptured a large flotilla of corn-ships, and steered them safely into Dunkirk. Soon after, being caught at a disadvantage by the English, he was taken prisoner and carried to Plymouth, but he soon managed to make his escape in an open fishing-boat to France. The king received him with distinction at Versailles, but at the same time spoke continually of the mischance which had befallen him the year before. Stung by this, Barth hastened to Dunkirk, and in spite of the blockade of the harbour by the English, undertook a cruise in which he was remarkably successful. At a personal audience in 1697, Louis XIV. appointed him to the command of a squadron, on which the honest seaman bluntly thanked the king in the words: 'Sire, you have done well in this.' The courtiers were shocked at the freedom of the speech; but the king took the answer in good part, and Barth soon justified his confidence. The peace of Ryswick terminated his active career. He died at Dunkirk, April 27, 1702. His rough frankness and coarse wit, which spared neither high nor low, made him popular, no less than his boldness and readiness for battle.

Barthélemy, AUGUSTE-MARSEILLE, a French poet and politician, was born at Marseilles in 1796. Educated at the Jesuit College of Juilly, he came to Paris in 1822, and soon made himself famous by a series of vigorous and pointed political satires in verse, directed against the Bourbons, and full of suggestive regrets for the glories of the empire. In *Napoleon en Egypte* (1828), and still more in his elegy for Napoleon's son, *Le Fils de l'Homme* (1829), he spoke out his imperialism more boldly, and the latter occasioned his imprisonment on the eve of the revolution of July. His liberation of course was immediate; and along with his friend Méry, he celebrated the victory of the people in a poem dedicated to the Parisians, and entitled *L'Insurrection*. During all the changes which followed, Barthélemy was indefatigable as a brilliant versifier on the political events of the day; though, in his later years, his popularity somewhat declined. He was, from the first, a warm supporter of the second Napoleonic régime. Some of his sayings are memorable, as the oft-quoted, 'L'homme absurde est celui qui ne change jamais.' His death took place, 23d August 1867, at Marseilles, of which city he was librarian.

Barthélemy, JEAN JACQUES, a learned French antiquary, born 20th January 1716, at Cassis, in Provence. Educated for the church, he early devoted himself entirely to the study of oriental antiquities, especially numismatics, but he retained the dress and title of an abbé. In 1745 he became attached to the Royal Cabinet of Medals, and in 1753 was appointed its director. Next year he visited Rome in the suite of M. de Stainville, the French ambassador, who, as Duc de Choiseul, became French minister in 1758, and soon after, by means of a liberal pension, placed Barthélemy in a position to devote himself entirely

to learned researches, which he quietly pursued till the revolution of 1789 deprived him of his offices. In September 1793 he was imprisoned on charge of being an aristocrat, but almost immediately released. Shortly after, he was offered the situation of national librarian then vacant, but his age and infirmities compelled him to decline it. He died April 30, 1795.

His most celebrated and popular work is the *Voyage du jeune Anacharsis en Grèce dans le Milieu du quatrième Siècle avant l'Ere Chrétienne* (4 vols. 1788), which shows an extensive knowledge of the ancient world, especially of Greece and its colonies, and abounds in observations which, if not profound, are at least judicious. Later and more severe criticism has, however, pointed out many deficiencies and anachronisms. It has been translated into almost every European language. Among Barthélemy's other works may be mentioned *Réflexion sur quelques Monuments Phéniciens* (1750), and *Réflexion sur l'Alphabet et la Langue de Palmyre* (1754). The first complete edition of his works was that of Villenave (4 vols. 1821), with a biography.

Barthélemy Saint-Hilaire, JULES, French savant and statesman, was born at Paris on the 19th of August 1805. On the completion of his studies he filled for some time a subordinate office under the minister of finance, while actively contributing as a liberal publicist to such newspapers as the *Globe* and the *Nation*. About the close of 1833 he turned from political strife to quieter studies, and in 1838 was appointed to the chair of Greek and Roman Philosophy in the Collège de France. In 1839 he became a member of the Academy. The revolution of February 1848 brought him once more into the political arena. He entered the Assembly, and became one of the leaders of the moderate party. At the *coup d'état* he was one of the patriots who were arrested and flung into prison. On his release he resigned his chair, as he could not take the oath of allegiance to Napoleon III., and returned to his studies, especially Sanskrit and ancient Indian philosophy. Elected in 1871 to the Assembly at Bordeaux, he gave constant support to Thiers. In 1876 he was elected a life-senator by the Assembly; and he held the portfolio of foreign affairs in Ferry's ministry, 1880-81.

His most important work is his French translation of Aristotle, various parts of which appeared from 1837 to 1883. Next to this are his contributions to western knowledge of Indian philosophy in the works, *Sur les Védas* (1854), *Du Bouddhisme* (1855), *Le Bouddha et sa Religion* (1859), and in numerous contributions to the *Mémoires* of the Academy and the *Journal des Savants*. He has written also on the Alexandrian school, on Plato and Aristotle's philosophy as compared with modern systems, on Mohammed, and on metaphysics; whilst in 1869 he published a poetical translation of the *Iliad*.

Barthez, PAUL JOSEPH, an illustrious French physician, was born December 11, 1734, at Montpellier, where, after serving as an army-physician, he settled as a professor, in 1785 as chancellor of the university, and where consultations with him on serious cases were sought from all parts of the civilised world. The Revolution deprived him of the greater part of his property; but Napoleon heaped honours and dignities upon him in his old age. He died October 15, 1806. Of his numerous writings, his *Nouveaux Eléments de la Science de l'Homme* (Montpell. 1778; 3d ed. Paris, 1858) was translated into most of the languages of Europe, and strongly supports the theory of vitalism and formative force.

Bartholdi, AUGUSTE, sculptor, a native of Colmar, Alsace, of Italian ancestry on his father's side, was trained in the studio of Ary Scheffer, and amongst other works has executed the Lafayette statue, New York; Vercingetorix, the Gaulish leader, now in the galleries of the French government; the 'Lion of Belfort,' and 'Grief.' That France should present to America some symbol in connection with the centenary of American independence occurred to him in 1874; the scheme took shape, and in November 1886 the gigantic bronze statue, 220 feet high, of 'Liberty enlightening the World,' which was completed in 1884, and had taken two years to get into position, was unveiled on Bedloe's Island, New York Harbour. Bartholdi received the cross of the Legion of Honour in 1887.

Bartholin, KASPAR, born in 1585 at Malmö; studied theology and philosophy at Rostock and Wittenberg, and in 1610 was made doctor of medicine at Basel. He practised for some time in Wittenberg, and in 1613 accepted an invitation to be professor of the Greek Language and of Medicine at Copenhagen, where in 1624 he became professor of Theology. He died at Sorö in 1629, after having written nearly fifty works on various subjects.—THOMAS BARTHOLIN, son of the above, and equally celebrated as a philologist, naturalist, and physician, was born in 1616. He became in 1647 professor of Mathematics at Copenhagen, and in 1648 was nominated to the chair of Anatomy. He died in 1680. He enlarged the new edition of his father's *Anatomy* (Leyd. 1641; often reprinted) with a mass of new observations, and in his own writings warmly defended Harvey's doctrine of the circulation of the blood.

Bartholomew, ST, one of the twelve apostles, supposed to be the same person as Nathanael. He was a native of Galilee, but nothing authentic is known regarding his life and labours. According to the traditional record of Eusebius, he carried Christianity into India; Chrysostom speaks of him as a missionary in Armenia and Asia Minor. The church at Rome bearing his name claims to preserve his relics. The Roman Church holds his festival on the 24th August; the Greek on the 11th June. The primitive church possessed an apocryphal gospel under his name, but it is now lost.

Bartholomew, MASSACRE OF ST (Fr. *La St-Barthelemy*), the appellation given to the massacre of the Huguenots in Paris on the night of St Bartholomew's Day, 24th August 1572. After the death of Francis II. in 1560, Catharine de' Medici assumed the management of affairs, as regent for her son, Charles IX., and showed throughout a more than Italian craft and faithlessness, as well as a cruelty almost without parallel in modern history. In order to annoy the Catholic party of the Duke Francis of Guise, she granted an edict of toleration to the Reformed, at whose head was the Prince of Condé. Both parties took up arms, and there ensued a war which lasted for eight years, the cruelties of which, through mutual exasperation, are almost incredible. Guise was assassinated, and Condé was taken prisoner in the battle of Jarnac and shot (1569). His nephew, young Henry of Bearn, afterwards Henry IV., then became leader of the Huguenots, along with Admiral Coligny. It was not till the strength of both sides was exhausted, that the peace of St Germain-en-Laye was concluded in 1570, whereby the Huguenots obtained the free exercise of their religion. Catharine de' Medici now expressed much friendliness towards them, and even endeavoured to lull them into negligence by the marriage of the youthful Henry of Bearn with her daughter Margaret, 18th August 1572. Admiral Coligny was drawn to Paris, and the king not only

made him costly presents, but gave him an important office in the council of state. It was all the basest hypocrisy. When, by means of the marriage of Prince Henry, the most eminent of the Huguenots had been allured to Paris, Admiral Coligny was wounded by a shot from a window of the palace on 22d August 1572. The king, indeed, hastened to him, and swore to avenge him; but, on the very same day, the king was persuaded by his mother that the admiral sought his life. 'By God's death!' he exclaimed, 'let the admiral be slain, and not him only, but all the Huguenots, till not one remains that can give us trouble!' That night Catharine held a council, and appointed St Bartholomew's Day for carrying into effect the long-contemplated massacre. After Coligny had been murdered, a bell in the tower of the royal palace, at the hour of midnight, gave the signal to the assembled companies of citizens for a general massacre of the Huguenots, in which it is estimated that over 4000 perished. The king himself is popularly represented as having fired from his palace upon those that were fleeing past. The Prince of Condé and the king of Navarre only saved their lives by going to mass, and appearing to conform to the Catholic church. The provinces were at the same time summoned to similar slaughter; and although in some of them the officials were ashamed to publish the murderous commands which had been transmitted to them, there were found bloodthirsty fanatics enough, who perpetrated the greatest horrors for several weeks together in almost all the provinces, so that it was reckoned that 30,000 (some authorities make the number 70,000) persons were murdered. The pope celebrated the events of St Bartholomew's Day by a procession to the church of St Louis, a grand *Te Deum*, the striking of a medal, and the proclamation of a year of jubilee. Yet the crime was useless. The Huguenots had lost their chiefs, but, the first moment of stupor past, they took up arms with all the fury of despair. The royal troops were once more foiled in their attempts to take Rochelle; and Charles found himself forced to grant liberty of conscience to the Huguenots, at the very moment in which he was receiving for the massacre the enthusiastic congratulations of the courts of Rome and Spain. See White's *Massacre of St Bartholomew* (1867), and the works cited at HUGUENOTS.

Bartholomew Fair, held at West Smithfield, London, from 1133 till 1855, the charter for it having been granted by Henry I. to a monk named Rahere, who had been his jester, and had founded the priory of St Bartholomew (see below). The fair was held annually at the festival of St Bartholomew (August 24, old style); but in 1753, owing to the alteration of the calendar, it was for the first time proclaimed on 3d September, having in 1691 been curtailed from fourteen to four days. In the first centuries of its existence, Bartholomew Fair was one of the great annual markets of the nation, and the chief cloth-fair of the kingdom. Its articles of traffic were besides cloth stuffs, leather, pewter, and live-stock; while it was rendered attractive to the crowds that attended it by a variety of popular amusements. All manner of shows, exhibitions, theatrical booths, &c. thronged the fair; and tumblers, acrobats, stilt-walkers, mummers, mountebanks, and merry-andrews resorted to it in great numbers. In 1685 the fair was leased by the city to the sword-bearer, and thenceforth it began to decay as a place of trade. In 1840 the exhibitions were removed to Islington; in 1850 the last proclamation by the lord mayor took place, and in 1855 the once famous fair came to an end. See Professor H. Morley's *Memoirs of Bartholomew Fair* (1859).

Bartholomew's (St) HOSPITAL, Smithfield, London, was founded in 1123 by Rahere, the first prior of the Convent of Augustinian Canons, which he also founded on Smithfield. An ancient chapel originally dedicated to the Holy Cross is now the parish church of St Bartholomew the Less. The hospital received fresh charters in 1544 and in 1547, escaped the fire of 1686, and was rebuilt in 1729. The endowment has been enlarged from public and private sources, and the revenues are large and ample. The hospital contains 675 beds, and affords relief to about 150,000 patients annually. There is a thriving medical school attached, attended by about 400 students; also a convalescent home attached to the hospital, containing 75 beds, at Swanley, Kent.

Bar'tizan, a small, overhanging, battlemented, parapet turret, projecting from the angles on the top of a tower. It was generally pierced with apertures for cross-bowmen, called *balistraria*. Dr Murray in his Dictionary says that the word is a spurious 'modern antique,' which had no existence in the times to which it is attributed. It was apparently first used by Sir Walter Scott, and was due to a misconception of a 17th-century illiterate Scotch spelling, *bertisene*, for 'bertising'—i.e. *bretising*, or *bratticing*, a *brattice* being a battle-mented parapet, originally of wood, and temporary.

Bartizan.

Bartlett, JOHN RUSSELL, American author, was born at Providence, Rhode Island, U.S., 23d October 1805. For a time in a banking-house there, in 1837 he became a bookseller in New York, giving his leisure to history and ethnology. He assisted in founding the American Ethnological Society, and was secretary of the New York Historical Society. He was employed by the United States government in 1850-53 as a commissioner for determining the Mexican boundary-line, and in 1854 published an account of his explorations and adventures in that capacity. In 1855 he became Secretary of State of Rhode Island, and in 1861-62 he was its acting governor. He was the author of *The Progress of Ethnology*, a *Dictionary of Americanisms* (enlarged ed. 1878), *Primeval Man* (1868), *Bibliotheca Americana* (4 vols. 1865-70), &c. He died 28th May 1886.

Bartlett, WILLIAM HENRY, artist, born in London in 1809, was a pupil of Britton, the architect, who afterwards employed him to make drawings for his *Cathedral Antiquities and Picturesque Antiquities of English Cities*. Subsequently Bartlett visited the Continent, the Holy Land, and America several times, on each occasion enriching his portfolio with innumerable interesting scenes. No fewer than nineteen quarto volumes, containing about 1000 engravings from his sketches, and letter-press from his own pen and those of his fellow-travellers, Dr W. Beattie, N. P. Willis, and Miss Pardoe, were devoted to these countries. Bartlett died on the voyage from Malta to Marseilles, 13th September 1854.

Bartoli, TADDEO, an Italian painter of the Siennese school (1362-1422).—**DANIELLO BARTOLI**, a learned Jesuit, was born at Ferrara in 1608, and died rector of the Jesuit College at Rome in 1685. His chief work is the *Istoria della Compagnia di*

Gesù (1653-73).—**PIETRO SANTO BARTOLI** (sometimes called 'Perugino'), born 1635, died 1700. He was a painter after the manner of Poussin, and a skilful etcher.

Bartolli'ni, LORENZO, a celebrated Italian sculptor, was born at Vernio, in Tuscany, in 1777, and came to Paris while still a young man. His chief patron was Napoleon, who in 1808 sent him to Carrara, to establish a school of sculpture. After the battle of Waterloo he repaired to Florence, where he died in 1850. Besides an immense number of busts, he produced several groups, the most celebrated of which are his 'Charity' and 'Hercules and Lycus.'

Bartolomme'o, FRA (properly Baccio della Porta), one of the most distinguished masters of the Florentine school of painting, was born at Florence, in Tuscany, in 1469. His first teacher was Cosimo Roselli; but he owed his higher cultivation to the study of the works of Leonardo da Vinci. His subjects are mostly religious, and by far the greater part of his pieces belong to the later years of his life. He was a warm adherent of Savonarola, after whose tragical end he in 1500 assumed the monkish habit. The visit of the young Raphael to Florence in 1504 seems to have been instrumental in stimulating him to resume his art. He imparted to Raphael his knowledge of colouring, and acquired from him a more perfect knowledge of perspective. The two remained constant friends—Bartolommeo on one occasion finishing certain of Raphael's unfinished works, Raphael performing a like kindness for him at another time. Bartolommeo died at Florence, 1517. The greater number of his works are to be seen at Florence, in the gallery of the Pitti Palace, but the Louvre possesses a fine 'Annunciation' by him. See Frantz, *Fra Bartolommeo della Porta* (Ratisbon, 1879); and Leader Scott, *Fra Bartolommeo* (Lond. 1880).

Bartolozzi, FRANCESCO, an eminent engraver, was born in Florence, September 21, 1727. After practising his art under Joseph Wagner at Venice, he went to Rome, where he executed his admired plates from the life of St Vitus. He was afterwards commissioned by Mr Dalton, librarian of George III., to engrave a series of drawings by Guercino, and was induced by the same patron to settle in England. Here Bartolozzi produced his exquisite line engravings of 'The Silence' and 'Clytie,' after Annibale Carracci, which entitle him to occupy the front rank in his profession. He also engraved numerous specimens of the works of his friend Giovanni Cipriani, of Michael Angelo, Carlo Dolci, Sirano, and others, with equal truth and effect. He likewise enriched Alderman Boydell's Shakespeare Gallery with many fine engravings. In 1769, on the formation of the Royal Academy, Bartolozzi was nominated one of the original members, and executed, from a design by his friend Cipriani, the diploma, which is still in use, and ranks as one of his masterpieces. In 1802 he accepted a flattering invitation from the Prince Regent of Portugal, to take the superintendence of a school of engravers at Lisbon, whither he repaired three years afterwards in his seventy-eighth year, and there resided until his death, March 7, 1815. He was the grandfather of the celebrated actress, Madame Vestris. His prints are said to be more numerous than those of any engraver, home or foreign; and include line engravings and stippled works, printed in brown and red. See *Bartolozzi and his Works*, by Tuer (2 vols. 1882), where the dates of his birth and death, about which a singular diversity of opinion appears to have existed, are verified.

Barton, ANDREW, a famous Scottish naval commander of the time of James IV., was killed

in an engagement with two English ships in the Downs, 2d August 1511.

Barton, BENJAMIN SMITH (1766-1815), American naturalist and medical practitioner, studied the natural sciences and medicine in Philadelphia, Edinburgh, and London (1782-88), and took his degree at Göttingen. He practised medicine in Philadelphia, and held successively the chairs of Botany and Natural History, *Materia Medica*, and Theory and Practice of Medicine in the university there. He became president of many learned societies, was a correspondent of Humboldt, and amongst other works wrote *Elements of Botany* (1812-14); *Collections for an Essay toward a Materia Medica of the United States* (3d ed. 1810); and *Flora Virginica* (1812).

Barton, BERNARD, the Quaker poet, was born at Carlisle in 1784. In 1809 he became clerk to a bank at Woodbridge, a post which he held till within two days of his death, 19th February 1849. His *Metrical Effusions* (1812) brought him into correspondence with Southey; whilst *Poems by an Amateur* (1818), *Poems* (1820), and several more volumes of verse, increased his reputation, and gained him the friendship of Byron and Lamb. His devotional poems have an echo of George Herbert, and some of his lyrics are graceful; but he is on the whole less a poet than a versifier, easy and pleasant withal. Lamb's advice to him was sound, 'Keep to your bank, and your bank will keep you;' and by Lamb's advice it was that he accepted the sum of £1200, raised by some Quaker friends in 1824. See his *Poems and Letters* (1849), selected by his daughter, with a memoir by Edward Fitzgerald.

Barton, ELIZABETH, commonly called the nun or maid of Kent, was born in 1506. About the year 1525, when a domestic servant at Aldington in Kent, she had an illness, in the course of recovery from which she fell into a strange state of nervous derangement and religious mania, in which she uttered hysterical ravings. When her illness left her, she still continued her trances and prophetic utterances, which drew so much attention that Archbishop Warham directed that two monks should be sent to examine her. One of these, Edward Bocking, at once saw in her abnormal faculties a rare opportunity for reviving popular respect for the Catholic church. He instructed her carefully in the controversial points between his church and the Protestants, as well as in the legends of the saints, and persuaded her to give herself out as directly inspired by the Virgin. Soon afterwards she became an inmate of the priory of St Sepulchre at Canterbury, but Bocking continued to be her close attendant and the inspirer of her prophecies and revelations. As soon as the divorce of Henry VIII. began to be discussed, the nun denounced it 'in the name and by the authority of God,' and threatened the king with death if he persisted in his purpose. Archbishop Warham was convinced by her earnestness, the astute Wolsey gave her an audience, Sir Thomas More listened to her more than once with interest, and Bishop Fisher wept with joy over her revelations. The king's marriage to Anne Boleyn (1533) and his subsequent immunity from the awful consequences so confidently foretold destroyed her credit; and, meantime, her friend Warham had died, and Cranmer reigned in his room. She was soon 'put to the question,' and repeated examinations drew a full confession from her in September of the same year that 'she never had visions in all her life, but all that she ever said was feigned of her own imagination only, to satisfy the minds of those which resorted to her, and to obtain worldly praise.'

After the humiliation of a public recantation, she was committed to prison; but soon after the close of the year was put on trial for high treason, condemned and executed at Tyburn with Bocking and four other accomplices on the 20th of April 1534. In her dying speech the nun described herself as 'a poor wench without learning,' who had been puffed up by praises to her own undoing and that of her companions.

Barton Clay is the name given to a series of beds which form the upper division of the Eocene of the Hampshire basin. These beds are well exposed in the cliffs of Hordwell, Barton, and in the Isle of Wight. They are believed to be the equivalents in age of the Upper Bagshot Sands of the London basin.

Barton-upon-Humber, an ancient town of Lincolnshire, on the south side of the Humber, $7\frac{1}{2}$ miles SW. of Hull. Pop. (1861) 3797; (1881) 5339.

Barn, a fine woolly substance found at the base of the leaves of the *Saguerus saccharifer* (also called *Arenga saccharifera*), one of the sago-palms of the Indian Archipelago. It is employed in calking ships, in stuffing cushions, and for other similar purposes.

Baruch ('the Blessed'), the son of Neriah, the faithful friend and secretary of the prophet Jeremiah. During the siege of Jerusalem by Nebuchadnezzar he was flung into prison along with the prophet, and found release only on the fall of the city (586 B.C.). He afterwards accompanied his master to Egypt, but of his after-life nothing certain is known. An apocryphal work in the Greek language has come down to us bearing his name, which contains in noble and glowing language a promise of future glory for Israel, and predicts the rebuilding of Jerusalem. There is usually appended to it, as chapter vi., a letter of the prophet Jeremiah to the exiles in Babylon. The Book of Baruch is the only book in the Apocrypha resembling the Prophets. It was held in little esteem by the Jews, and it is not until the time of Irenæus that it is quoted by Christian writers either in the East or West. It seems most probable that the present book was worked up by an Alexandrine editor, perhaps from an original Hebrew fragment.

Barwood. See CAMWOOD.

Barye, ANTOINE LOUIS, a French sculptor, distinguished mainly for his bronze statues of animals and animal-groups, was born at Paris, 24th September 1795, and was at first an engraver and metal-worker. His famous bronze of a lion struggling with a snake secured for him the cross of the Legion of Honour. He died 27th June 1875.

Bary'ta, or BARYTES, or Oxide of Barium (q.v.)—symbol BaO—is the earth present in the minerals *withelite* (carbonate of barium) and *heavy spar* (sulphate of barium). It may be prepared in several ways: (1) By acting upon the carbonate of baryta, BaCO₃, by nitric acid, HNO₃, which causes the disengagement of the carbonic acid, CO₂, and the nitric acid combining with the baryta forms the nitrate of barium, Ba₂NO₃. On evaporating the latter substance to dryness, and igniting the residue, the nitric acid volatilises, and leaves the baryta, BaO. (2) Another mode of preparing the same substance is to act upon a solution of sulphide of barium, BaS, by the black oxide of copper, CuO, when an interchange of elements occurs, the sulphur uniting with the copper, producing sulphide of copper, Cu₂S, and the oxygen with the barium, forming baryta, BaO, which remains dissolved in the water, and, on evaporation, deposits crystals in the hydrated condition, BaH₂O₇.8H₂O. Baryta belongs to the group of

alkaline earths, and has the property of acting like an Alkali (q.v.) on colouring matters. It has a very harsh taste, is highly caustic, and is very poisonous. The presence of carbonic acid gas may be detected by exposing a solution of baryta to the air, when carbonic acid combines with the baryta and forms a film of white carbonate of barium, BaCO_3 . Baryta exposed to air or oxygen absorbs oxygen, forming peroxide of barium. On this being heated, oxygen is liberated and baryta again produced. Till lately it was found impossible to procure oxygen by this simple method, as the action became weak when the process was repeated. But recently it has been found that by carefully removing all carbonic acid gas and water from the air before passing it over the

Crystal of Sulphate of Baryta.

barium, the difficulty is removed, and oxygen is thus economically produced. The *sulphate of baryta*, BaSO_4 , otherwise called *ponderous* or *heavy spar*, is found in fissures or cracks in other rocks. It is crystalline, and is sometimes found pure and white, but generally presents a flesh-red colour, from the red oxide of iron (rust) incorporated in it. The rust can be got quit of by reducing the sulphate of baryta to a fine powder under rollers or travelling-wheels, and subjecting the pulverised material to the action of dilute sulphuric acid, which dissolves the oxide of iron, and leaves the sulphate of baryta as a white dense powder. The principal use of *heavy spar* is as a pigment under the name of *permanent white*; but having little opacity, it cannot be employed by itself, but only when mixed with ordinary white-lead. When added to the latter, however, it must be regarded as an adulteration, for the little opacity it possesses renders it of service only as an increaser of the bulk of the white-lead. Several mixtures of sulphate of baryta and white-lead are manufactured, and are known in commerce. *Venice White* contains 1 part sulphate of baryta and 1 part white-lead. *Hamburg White* contains 2 parts sulphate of baryta and 1 part white-lead. *Dutch White* contains 3 parts sulphate of baryta and 1 part white-lead. The native sulphate of baryta has been employed by the celebrated potter Wedgwood in the manufacture of jasper ware, and for the formation of white figures, &c. on coloured jars and vessels. The *carbonate of baryta* found native as *witherite*, and the *nitrate of baryta*, have been previously referred to in this article and that on BARIUM.

Baryton (Viola di Bardone), an old chamber-instrument, somewhat like the viol di gamba in tone: had a broader finger-board, with six or seven gut-strings, while under the neck there were from nine to twenty-four strings of brass wire, which were pinched with the point of the thumb, to produce a sound, while the gut-strings were acted on by a bow. For the baryton voice, see BARITONE.

Bas, or **BATZ**, a small island in the English Channel, belonging to France, and situated off the north coast of the department of Finistère. Its length is about $2\frac{1}{2}$ miles, and its breadth about $1\frac{1}{2}$ mile. It has three villages; a fine haven, that of Kernoc, and a lighthouse. Pop. about 1200, whose chief occupation is fishing.

Basalt. Basalt-rocks are of igneous origin, and are composed essentially of plagioclase

felspar, augite, olivine, and generally magnetite or titaniferous iron. They show all varieties of texture, from smooth-compact up to coarsely crystalline, and vary in colour from pale blue up to dark-grayish blue, brownish, and black. The vitreous varieties are *Tachylite* and *Hyalomelane*; compact or crypto-crystalline varieties are termed *Basalt*; fine-grained kinds are called *Anamesite*; while *Dolerite* is the name given to the more coarsely crystalline kinds. Seen under the microscope, the compact and fine-grained basalt-rocks often show a certain proportion of glassy or devitrified matter lying between the various crystalline minerals of which the rock is chiefly composed. Basalt-rocks are often vesicular and amygdaloidal. Sometimes they occur as lava-flows, at other times they appear as intrusive sheets, dikes, and masses. They are of common occurrence in Britain, more especially in Scotland. As examples of lava-form basalt-rocks may be cited those of Mull, Staffa, and other islands of the Inner Hebrides. Similar lava-form basalt-rocks are well developed in Antrim. Intrusive basalt-rocks are abundant in Central Scotland—Salisbury Craigs, Edinburgh Castle Rock, Dalmaahoy Craigs, Abbey Craig, &c. are examples.

The older basalt-rocks have frequently undergone some changes, owing to the chemical action of percolating water. Such altered rocks have often a dull greenish colour, the greenish tinge being due to the conversion of the augite and olivine into green serpentinous and chloritic products. Such more or less altered varieties of basalt-rock sometimes acquire special names—the finer-grained kinds being called *melaphyre*, and the coarser-grained ones *diabase*. When basalt-rocks have been intruded amongst coals or black shales, they often become gray, white, or yellow in colour, and assume a dull earthy appearance. This is the so-called *white-trap*.

There are volcanic masses of Tertiary age which occur in such regions as the Thüringer Wald, Erzgebirge, the Eifel, Italy, &c. which closely resemble basalt-rocks. In these rocks, however, the minerals nepheline and leucite play the part of plagioclase felspar. The rocks, therefore, are known as *nepheline-basalt* and *leucite-basalt*, to distinguish them from ordinary basalt, or, as it is sometimes called, *plagioclase-basalt*. The latter ranges in age from Lower Carboniferous times at least, up to the present; the former are not as yet known from any older stage than the Tertiary.

Basalt-rocks, especially the compact varieties, often assume a columnar structure. This structure, however, is not confined to basalt-rocks. The columns vary in the number of their angles from 3 to 12, but they have most commonly from 5 to 7 sides. In some cases they are more or less perfectly hexagonal. They are generally divided transversely by joints at tolerably equal distances, and in the case of the more perfectly columnar rocks, these joints often show at each articulation a cup and ball socket. The columns are always arranged at right angles to the planes of cooling, so that in the case of an approximately horizontal bed or sheet the columns are vertical, while in the case of a vertical dike, they are horizontal. Various explanations of this remarkable structure have been advocated, none of which can be said to be perfectly satisfactory. The general belief, however, is that they are the result of contraction upon cooling. Two of the best known and finest examples of columnar structure in basalt-rocks are Fingal's Cave in the island of Staffa (q.v.), on the west coast of Scotland, and the Giants' Causeway (q.v.), on the north coast of Ireland.

Basalt-rocks, owing to their toughness and

hardness, and to the fact that their mineral ingredients yield unequally, are much employed for causeway-stones and 'road-metal.'

Base, in Chemistry, is a term applied to a compound body, generally consisting of a metal united with oxygen. Thus, the metal potassium, K, when it combines with oxygen, O, forms the oxide K_2O , which unites with water, yielding the base potash, or caustic potash, KOH; and similarly lead, Pb, and oxygen, yield the base oxide of lead, or litharge, PbO . A distinguishing feature of a base is that it is capable of entering into double decomposition with an acid, more or less neutralising its acid properties, and forming a Salt (q.v.) and water. Thus, the base potash combines with sulphuric acid to form the salt, sulphate of potash, and water, as represented by the following equation:

So also potash and nitric acid, HNO_3 , yield the salt nitrate of potassium, or nitre, KNO_3 . Occasionally sulphur replaces the oxygen in a base. Thus, the metal potassium, K, unites with sulphur, S, to form the *sulphur base*, sulphide of potassium, K_2S , which can unite with a sulphur acid like sulpharsenious acid or orpiment, As_2S_3 , to make the salt sulpharsenite of potash, $K_2S.As_2S_3$. The metal half of a base need not be a simple element, but may be a compound body which, for the time, plays the part of a simple substance. Thus, the compound ethyl, C_2H_5 , can combine with oxygen

to form ordinary ether, C_2H_5O ; and the base thus produced can, in its turn, combine with acids to form salts. A base may be soluble or insoluble in water. Thus, the bases potash, K_2O , soda, Na_2O , ammonia, NH_4HO , baryta, BaO , strontia, SrO , lime, CaO , and magnesia, MgO , are more or less soluble in water; whilst the oxide of iron or rust, Fe_2O_3 , and the red oxide of mercury, HgO , are insoluble in water, but soluble in acids. For organic bases, &c., see ALKALIES, ALKALOIDS, and AMINES.

Base, in Architecture, the foot or lower member of a pillar, on which the shaft rests. See COLUMN.

Base, in Heraldry, the lower portion of the shield. Any figure placed on it is said to be in base. A small portion of the base of a shield parted off by a horizontal line is sometimes called a base.

Base-ball. The American national game of base-ball is an evolution from the old English schoolboy game of Rounders; but unlike the boyish pastime from which it had its origin, it requires many qualities to excel in it. In base-ball, as in rounders, the players use a bat and a ball, and run around bases, but there all resemblance between the two games ceases. As the game of base-ball is now played, it is full of excitement, and is engaged in with equal zest by schoolboys on an open field, and by trained professional experts on inclosed grounds, presenting to the latter full scope for the exercise of those mental and physical attributes which mark the intelligent and practised athlete.

Cricket and base-ball are coupled in Miss Austen's *Northanger Abbey*, which was written about 1798. In the States, the Knickerbocker Club was founded at New York in 1845, the Excelsior Club at Brooklyn in 1860; but it was not till 1865 that the game became universal.

The theory of base-ball may be briefly summed up as follows: A space of ground, in the form of a diamond, 90 feet square, is marked out on a level field of three or four acres in extent. Bases are

placed on or within each angle of the diamond, and are called respectively *home*, *first*, *second*, and *third bases*. Each team consists of nine players; and the home team has the choice of first innings, its members taking the bat in regular succession. The man at the bat is termed the batsman, or striker, and his side may be regarded as the defensive force,

Fig. 1.—Diagram of Base-ball Ground.

the field side being the attacking party. The several members of the latter party are disposed as follows: The pitcher, near the centre of the diamond; the catcher, behind the home base; the first baseman, near the first base, to the right of the catcher; the second and third basemen, near the second and third bases; and about midway between these, the short-stop; with out-fielders at right, centre, and left fields, more or less in line with first, second, and third bases respectively.

When the fielding side take their positions and the play begins, the pitcher delivers the ball, a fair ball being one that passes over the home base, and not lower than the batsman's knee nor higher than his shoulder. Such a ball counts a strike, whether the batsman strikes at it or not, and after four fair balls the striker is obliged to run, or is put out; but, on the other hand, five unfair balls delivered by the pitcher entitle the batsman to a base. The batsman endeavours to send the ball out of the reach of the fielders, and far enough out in the field to enable him to make the round of the four bases without being put out, in which case he scores a run. Each base, however, is a resting-place, and he may stop on any base until either he sees an opportunity to steal to the next, or a succeeding batsman sends the ball far enough to enable him to run with safety—for, except when occupying a base, the runner touched with the ball by a fielder is out. All three bases may thus be occupied at once; but when the next batsman becomes a base-runner, the runner on first base must pass on to second base, which must be vacated to receive him, otherwise he is put out. This rule and another, obliging runners to return and touch the base last

occupied when a striker's ball is caught before touching the ground, afford scope for 'double-play,' as a fielder may catch the striker out, and then throw the ball to a base-keeper before another of the same side who is running bases can return. A batsman can only run on a fair hit, which is a ball batted within the lines of the diamond between the home and first and third bases, or continuations of them marked in white on the grass; but he may be caught out on a foul hit just as on a fair, and if, after a fair hit or four strikes, the ball is fielded to first base before he arrives there, he is out. The first striker is followed by others in rotation at the bat, until three of the batting side are put out, when the field side take their turn at the bat. This goes on until nine equal innings have been played, and then the side scoring the most runs wins the game. It will be readily seen that the theory of the game is very simple, and it is this simplicity of construction which forms one of its chief attractions; and yet to excel in the playing of all the points of the game requires not only the possession of the physical attributes of endurance, agility, and strength, together with good throwing and running powers, and plenty of courage, pluck, and nerve, but also the mental powers of quick perception, thorough control of temper, and the presence of mind to act promptly in critical emergencies of the game.

The weight of the ball used is 5 to 5½ ounces, its circumference 9 to 9½ inches; and it is much more elastic than a cricket ball. The bat is round, not more than 2½ inches in diameter at the thickest part, and must not exceed 42 inches in length.

Fig. 2.—Base-ball Bat.

The ball is delivered by the pitcher with great swiftness, an underhand throw being allowable and very generally employed; and this high speed attained enables a skilful player to send the ball with such a twist or *curve* as will deceive the batsman, and make him think a fair ball bad and an unfair ball good. This effect is obtained by the resistance offered to the ball by the air, and a rotary motion of the ball on its own axis, supplied by the pitcher; and the direction of the curve is determined by the manner in which the ball is delivered from his hand. Curved pitching has been brought to considerable perfection of late years, but a certain want of accuracy makes it advisable for the catcher, when playing close behind the batsman, to wear a strong wire mask, and has produced a rule entitling a batsman who is struck by the ball to take his first base therefor. Prior to 1887, there were no less than four special professional codes of playing rules in use, besides those governing amateurs; but since the beginning of that year, the game has been played under a set of 'National Rules,' agreed to by all players.

The great popularity of base-ball in America has led to the establishment of regular stock-companies, employing a large amount of capital in the business of 'running' professional club teams, whilst the outlay each season reaches in the aggregate to over a million of dollars. The principal contests for the championship of the United States have sometimes led to gatherings of spectators numbering ten thousand or more, each paying half a dollar admission to the inclosed grounds; and in one instance, in New York City in 1886, over thirty thousand spectators witnessed one of the championship matches. The expense of organising a first-class

professional team frequently reaches thirty thousand dollars. During 1886 nearly three thousand professional contests took place. What with the college clubs and the amateur organisations of the country, it is safe to say that hundreds of thousands of young men participate in base-ball games during each season, from April to October.

Basedow, JOHANN BERNHARD, educationist, was born 11th September 1723, at Hamburg, where his father was a peruke-maker. In the year 1753 he was appointed a master in an academy at Sorde. In 1761 he was removed from the gymnasium at Altona on account of heterodox opinions. Rousseau's *Emile* awakened in him, in 1762, the thought of improving the method of education, and of reducing to practice Rousseau's maxims and those of Comenius. Contributions from princes and private persons, amounting to 15,000 thalers (about £2200), covered the cost of his *Elementarwerk*, which was illustrated with 100 copperplates, and was intended to bring the minds of children into contact with realities, and not mere words. As a model school on this method, he established in 1774 the *Philanthropin* at Dessau; but his restlessness of disposition, and his quarrels with his colleagues, led to his withdrawal, and it was finally shut up in 1793. Basedow died at Magdeburg, July 26, 1790. His influence on the public mind of his age, particularly in Germany, was very great, and his numerous works powerfully awakened attention and interest in the much-neglected subject of education. See his *Life* by Meyer (2 vols. Hamburg, 1792).

Bas'el (Fr. *Bâle*; older Fr. *Basle*), a city and canton of Switzerland. The canton was divided in 1833 into two independent half-cantons, called *Basel-city* and *Basel-country*. The urban half-canton consists only of the city, with its precincts, and three villages on the right bank of the Rhine; the remainder forms the half-canton of *Basel-country*. The canton of Basel borders on Alsace-Lorraine and Baden, and has an area of 177 sq. m.—but little larger than the county of Rutland. Lying on the northern slope of the Jura, it is a country of hills and valleys. The mountains attain an elevation of over 3400 feet. The chief rivers of Basel are the Rhine and its tributaries, the Birz and Ergloz. The soil is fertile and well cultivated. The climate, except in elevated situations, is very mild. The inhabitants are chiefly employed in agriculture, the cultivation of fruit-trees and of the vine, cattle-husbandry, fishing, salt-works, the manufacture of ribbons (to the value of almost £2,000,000 annually), woollens, linens, and leather.

The city of Basel arose out of a Roman fortified post, known as *Basilia* after an imperial visit in 374. From an early period it was the seat of a bishop, and in the beginning of the 10th century the Emperor Henry I. rebuilt the town, which then became a place of importance, and after 1032 formed part of the German empire. The centuries that follow are marked by a steady extension of the authority of the burghers, whose repeated efforts to break the power of the bishop and the nobles fills up the history of the period. Involved in many feuds with the House of Hapsburg, Basel formally joined the Swiss Confederacy in 1501. From 1519 onwards, Luther's writings were printed here; and at the end of twenty years from that time, the reformed doctrine had become generally prevalent. After the union with Switzerland, the triumph of the burgher party became also more complete; but the peace of the city was often disturbed by strife caused by the assertion of undue authority by the magistrates. All parties in the city, however, combined against the country district; and persons

belonging to the city were appointed to all offices, civil and ecclesiastical. Under the impulse communicated by the French Revolution, equality of rights was conceded in 1798; but in 1814 the new constitution made the city again supreme. After unsuccessful attempts to obtain redress of grievances by petition, civil war broke out in 1831, which did not cease till the troops of the Swiss Confederation took possession of the canton, and the diet recognised the separation of the city and the country district in 1833. The constitutions of the two half-cantons are in most respects similar, and are framed on the basis of the old constitution, modified in accordance with the principle of universal suffrage. According to the census of 1880, the half-canton of Basel-city contained 65,101 inhabitants, of whom 44,236 were Protestants; and Basel-country, 59,271, of whom 46,670 were Protestants. The capital of Basel-country is Liestal. Both Roman Catholic and Protestant clergy are paid by the state, and the parishes of the Reformed Church have received the right of choosing their own pastors.

The city of Basel was much more important in the middle ages than now; and this though its population has grown from 29,555 in 1850 to 68,992 in 1885. In the 14th century, the number of its inhabitants was greatly reduced by the plague, or 'Black Death' (q.v.), which raged in it with terrible severity, and is sometimes mentioned as the 'death of Basel.' The town is well built and clean, but its appearance does not proclaim it the wealthiest city in Switzerland, as it is. The Rhine, here spanned by three bridges, 200 yards long, divides the city into two parts—Great Basel on the south side, and Little Basel on the north. The minster, a cathedral till 1528, was founded by the Emperor Henry II. in 1010, but not completed till 1500. It was restored in 1852–56, and has two conspicuous towers, 218 feet high. Other buildings are the town-hall (1508); the university, founded in 1460; a museum, in which there are thirty-two pictures by the younger Holbein, who lived thirteen years in Basel, though a native he was not; and a public university library of 160,000 volumes and 4000 manuscripts. During the Reformation, the university was a central point of spiritual life, and it has numbered among its professors men of great eminence in learning and science, including Erasmus and Œcolampadius, both of whom died here, and the mathematicians Euler and Bernoulli, who were natives of Basel. It has now some 70 professors and lecturers, and about 300 students.—At Basel was concluded on 5th April and 22d July 1795 a treaty between the French Republic, Prussia, and Spain, Prussia withdrawing from the coalition against France.

Basel, COUNCIL OF (1431–43), the last of the three great reforming councils of the 15th century, was summoned by Pope Martin V., and opened under his successor Eugenius IV., 23d July 1431. Its first session was held at Basel on 14th December 1431. Instead of the method followed at Constance, where the members deliberated and voted by nations, the council was divided into four departments, each with its own organisation, and each investigating a special class of subjects, its decision and reasons being communicated to the others. If three agreed in their opinions, the matter was brought before the whole council for final discussion and judgment. In this way the influence and intrigues of the Italian bishops were neutralised. The council addressed itself to the reconciliation of the Hussites, and to the reform of abuses in the church itself. But the first attempt to conciliate the Hussites was met with resistance by the pope, who not only refused his sanction, but empowered the cardinal legate to dissolve

the council. The council strongly repelled the pope's pretension of right to dissolve it, and proceeded with its business. His injunctions that it should remove to Italy were equally disregarded. It renewed the decree of the Council of Constance, asserting the right of a General Council to exercise authority over the pope himself, and on his persevering to issue bulls for its dissolution, caused a formal process to be commenced against him, and cited him to appear at its bar. It assumed the papal powers, and exercised them in France and Germany, where its authority was acknowledged. It concluded a peace, in name of the church, with the Calixtines, the most powerful section of the Hussites, by the Prague Compact of 20th November 1433, granting them the use of the cup in the Lord's Supper. At length, Eugenius IV., being hard pressed by insurrections in the States of the Church, and afraid of losing his whole influence in France and Germany, solemnly ratified all its decrees, by a bull dated 15th December 1433. Desirous, however, of limiting the papal prerogatives, the council restricted the power of granting interdicts, abolished *annats* and other grievous exactions, and prohibited the bestowal of reversions to ecclesiastical offices. It also appointed punishments for certain immoralities in the clergy, and prohibited Festivals of Fools, and all the indecorous proceedings which had been commonly practised in churches at Christmas; and it adopted decrees concerning the election of popes, and for the regulation of the College of Cardinals.

At this time, a prospect was opened up of the union of the distressed Greeks with the Church of Rome, and a council was proposed to this end. The Basel fathers refused to meet in Ferrara, and having again cited the pope to its bar, not only, on his failing to appear, declared him contumacious, but on his opening an opposition council at Ferrara, went so far as, on January 24, 1438, to decree his suspension from the functions of his office. His party, however, was so strong that this decree could not be carried into effect; and the cardinal legate, with the greater number of the Italians, left Basel, and went over to his side. All the more resolutely did Cardinal Louis Allemand, Archbishop of Arles, a man of high courage and eloquence, now guide the proceedings of the council, which on May 16, 1439, declared the pope a heretic, for his obstinate disobedience to its decrees; and in the following session, formally deposed him for simony, perjury, and other offences. On November 5, 1439, it elected Duke Amadeus of Savoy to be pope, who styled himself Felix V., but was recognised only by a few princes, cities, and universities. France and Germany accepted the reforming decrees of the council, but remained neutral in the question regarding the popedom. The friendship of the Emperor Frederick III. strengthened the party of Eugenius; and the council gradually melted away, and its members, after three years of inactivity, held its last session at Basel on May 16, 1443, and removed its seat to Lausanne. Here a few prelates still remained together under the presidency of Cardinal Allemand, till in 1449, after the death of Eugenius, and the resignation of the antipope Felix, a compromise was effected, by which the fathers directed the church to obey the new pope, Nicholas V., who in return confirmed the acts of the council. Thus ended the last attempt to reform the church from within, and on its old basis. The Basel reforming decrees are contained in no Roman Catholic collection, and are held to be invalid by the canonists of Rome; yet they are of authority in canon law in France and Germany, although their application has been modified by recent concordats. See vol. vii. of Hefele's *Konstanzgeschichte* (Freiburg, 1869).

Base-line. See ORDNANCE SURVEY.

Basella, a tropical genus of *Chenopodiaceae* (q.v.). *B. alba* and *B. rubra* are known in Britain as stove biennials. They are plants with twining stems, in common use as pot-herbs in the East Indies, and cultivated in China; also sometimes in France as a substitute for spinach. *B. rubra* yields a rich purple dye. The great fleshy root of *B. tuberosa*, a South American twiner, is edible.

Base of Operations, in warfare, is the receiving depôt where everything required for prosecuting the campaign is collected and organised before being forwarded to the front, and to which the sick and wounded can be sent back for removal to their homes when opportunities occur. It is usually a port, a stretch of sea-coast, or a river, but may be a mountain-range or tract of country connected by a line of open communication with the army, and supplying it constantly with recruits, remounts, food, ammunition, &c.; so that, if cut from its base of operations, the army is completely paralysed. In the Crimean campaign, the sea-coast from Kamiesch to Balaklava was the base of operations for the allies. In the late Egyptian war, the British base was at first Alexandria and afterwards Ismailia. The German base of operations during the campaign against France in 1870-71 was the right bank of the Rhine, from Cologne to Karlsruhe, with its many fortresses.

Bashahr, one of the Punjab Hill-states, on the lower slopes of the Himalayas, traversed from east to west by the Sutlej. Area, 3320 sq. m. The rajah and upper classes in the southern parts are Rajputs, and the people generally are of Hindu race, but their observance of Hinduism is very partial. The rajah pays tribute to the British government, for which he is required to raise troops in time of war, and by which his sentences of death must be confirmed. Pop. (1881) 64,345.

Ba'shan, a country of North-eastern Palestine, situated to the east of the Jordan. This region is a volcanic plateau rising in the Jebel-ed-Drus to 6000 feet; extends 60 miles north and south, and about 40 miles east and west. Josephus mentions four provinces: Gaulonitis, a western division, the territory of Golan, the ancient Hebrew city of refuge; Trachonitis (ancient Argob) to the east, now known as the remarkable volcanic region of the Lejâh; Auranitis, comprising the fertile Haurân plain; and Batanea to the south, the seat of the Druses (q.v.). In the time of Abraham, Bashan was occupied by the Rephaim ('giants'). Ashteroth-Karnaim, identified with Busrah; Edrei, identified with Derât; and Kenath, with Kunawât, were its chief cities; the first two being the residence of its kings during the Amorite dynasty. The last of its Amorite rulers was Og, who with all his sons was killed by the Israelites under Moses, at the battle of Edrei, when the half-tribe of Manasseh settled in the land. The men of Bashan were remarkable for their stature, its soil and pastures for their richness, and its sheep and oxen for their size and fatness. Bashan is covered with the ruins of the so-called 'giant cities,' which, however, according to Captain Conder, date only from the early Christian centuries; their roofs, doors, stairs, and windows are of stone, some of them as perfect as when first built. Bashan belonged to the tetrarchy of Philip, and afterwards to that of Agrippa II. See Dr Porter's *Giant Cities of Bashan* (1865).

Bashaw. See PASHA.

Bashi, or BATANES ISLANDS, the most northerly small cluster of islets in the Philippine chain of islands, lying between Luzon and Formosa. Politically, they are a dependency of the Philippines; but physically, they form a link in the vast archi-

pelago which, from Formosa to Sumatra inclusive, connects the south-east of China with the west of Malacca. They consist of three larger (Bayal, Batan, and Saptang) and many smaller islets, and have a united area of 127 sq. m., with a pop. (1879) of 8250, who subsist on the yams and batatas they grow.

Bashi-bazonks (mod. Turk., 'hot-brained') are irregular troopers in the pay of the sultan. Very few of them are Europeans; they are mostly Asiatics, from some or other of the provinces in Asiatic Turkey. They are wild turbulent men; brave enough if serving under some leader who understands them; they receive no regular pay. They may be either infantry or cavalry, and their usual weapons are a long lance, a sabre, several pistols, and one or more daggers. The famous 'Bulgarian atrocities' of 1876, which roused the indignation of Europe, and ultimately cost the corrupt Turks their supremacy, were mainly due to the lawless brutality of these ruffians.

Bashkirs, a Mongolian people, are a branch of the Ural-Altaic stock, and inhabit the Russian provinces of Perm, Orenburg, Viatka, and Ufa. Sunnite Mohammedans in faith, and partly nomadic in habits, they number about three-quarters of a million in all.

Basic Slag. See SLAG.

Basic Steel. See BESSEMER STEEL.

Basil, surnamed THE GREAT, and called St Basil, one of the most eminent and eloquent of the Greek Fathers, was born about 329 at Cæsarea, in Cappadocia; studied under the heathen philosophers at Athens, where he began a lifelong friendship with Gregory Nazianzen, his later letters to whom are full of information about contemporary times; became an advocate in his native city, but afterwards founded a monastic society; was ordained a presbyter in 364; and succeeded Eusebius as Bishop of Cæsarea in 370, in which office he continued till his death in 379. He resolutely resisted invitations to the court of Julian the Apostate, with whom he had contracted an intimacy as a fellow-student at Athens, and displayed great constancy when the Emperor Valens began to persecute him on account of his opposition to Arianism. He was engaged in most of the controversies of his time, but conducted controversy in a gentle and generous manner. His rules of monastic life are still followed in the Greek and other oriental churches, in which he is highly honoured as one of the greatest of saints. In the Roman Catholic Church, also, they are followed in a few convents, styled of the order of *Basilians*. He is also the author of a revised liturgy, still in use in the East, known as the *Liturgy of the Holy Basil*; but his chief services to the church were in defence of the Nicene creed against the Arians. The best editions of his works are those of the Benedictines (3 vols. Par. 1739), and that of Migne in 4 vols. (29-32) of his *Patrologia Græco-Latina* (Par. 1866); but the authenticity of many of his moral and ascetic pieces is doubtful. His anniversary is celebrated, in the Greek Church, on the 1st of January—the day of his death; in the Latin Church, on the 14th of June—the day of his ordination.

Basil I., the Macedonian Byzantine emperor 867-886, came to Constantinople when still a young man, and was in 861 appointed chamberlain to the Emperor Michael III. After the assassination of this monarch in 867, Basil became sole emperor of the East. His first care was to heal the wounds of the state; and, as the prodigality of Michael had exhausted the public treasury, he took means to refill it by a wise economy. His valour made

him the terror of the Saracens, from whom he reconquered Asia Minor. He sent missionaries to the Russians of Kiev, who, from that time, began to embrace Christianity and acknowledge the authority of the Greek Church. He died in 886. Basil founded a pure despotism, and, as part of a system of centralisation, placed eunuchs at the head of the departments of state, who, as they could not found a dynasty, would be less tempted to rebellion. He also introduced the principle of legitimacy in succession, and initiated the custom of having his descendants born in the 'porphyry chamber, so that the title Porphyrogenitus might be equivalent to Prince Royal. He left his dynasty so secure that it reigned in greater or less prosperity for 200 years.

Basil (*Ocimum*), a mainly tropical or sub-tropical genus of Labiatae (q.v.), characterised by a pleasant aromatic smell and taste, and reckoned among *sweet herbs*.—**SWEET BASIL** (*O. basilicum*) is an Indian annual which has long been cultivated in Europe for seasoning purposes. It was formerly also of some medicinal repute, and is doubtless a gentle carminative. Many superstitions attach to it. The ancients asserted that the plant had the power of propagating scorpions, even in the brains of men. The belief that it thrives especially on the brains of murdered men occurs in the *Decameron*, and is rendered familiar by Holman Hunt's picture.—**BUSH BASIL** (*O. minimum*) is of similar origin and uses. The seed of both species should be sown on a hotbed, and subsequently planted out.—**WILD BASIL** (*Calamintha clinopodium*) and **BASIL THYME** (*C. Acinos*) are natives of Britain, and are similarly fragrant and aromatic.—**Basil Vinegar** is made in the same manner as Mint Vinegar, by steeping the leaves in vinegar. It is used for seasoning, in winter, when the fresh plant cannot be obtained.

Basilica (Gr. *Basilike*, from *Basileus*, 'a king'), a market-place, exchange, and place of meeting for men of business generally. The first basilica we hear of at Rome is the Basilica Porcia in 182 B.C. From this period till the time of Constantine, they were constructed in great numbers. Some twenty are known to have existed in Rome, and latterly every provincial town, even those of small extent, had each its basilica, as that of

court of justice. It has generally been supposed that the prætor's apse and seat were at one end of the central division, immediately opposite the entrance at the other, but this is now disputed (see *APSE*). The form of the basilica was not always

Fig. 2.—Ground-plan of Basilica of St Paul, Rome.

the same. Sometimes there was no hemicycle or apse, as in the basilica at Pompeii, in which case the tribunal was cut off from the nave; sometimes there were two, as in the basilica of Trajan. Again, the basilica was sometimes entered, not from the end, but from the sides, where the transepts of a modern church are situated; and at the end opposite that in which the tribunal was placed there was often a row of small chambers, the uses of which do not seem to be very accurately ascertained, and probably were not invariable. In the plan of the basilica of Pompeii there was an outside stair which led to the upper gallery, which in this case passed entirely round the building. The gallery was the place to which loiterers usually resorted for the purpose of watching the business proceedings below; and the one half of it is said to have been devoted to men, the other to women. The large churches of the Christians, erected after the religion was adopted in the empire, had a considerable general resemblance to the Roman basilica, and those churches have always gone by the name of basilicas. But Professor Baldwin Brown disputes this, and maintains that the early church was rather an enlarged schola (or guild-hall) than a basilica. Probably the professor's view is right as regards the churches of the first three centuries, but when thereafter the congregations largely increased, the churches were enlarged after the idea of the basilica.

Fig. 2 shows the usual plan of these Christian basilicas—a large oblong space, divided into central nave and side aisles by two or four rows of columns, preceded at the entrance end by a porch or narthex (to which alone the neophytes and penitents were admitted), and terminated at the opposite end with a cross wall, containing in the centre a great triumphal arch which led into the

Fig. 1.—Section of Trajan's Basilica, Rome.

Pompeii, which is now the most perfect example, still testifies. The earliest basilicas were entirely open to the external air, and were surrounded with a portico under which shelter could be obtained; but in course of time the central space was also covered in. The basilica then became an oblong hall, divided with rows of columns into a wide central nave and lower side aisles, over which there was frequently a gallery. The central space was lighted with windows in the upper part of its side walls (like the clerestory of a church). Amongst its other uses, the basilica contained an apse, in which the prætor conducted his

transept or sanctuary reserved for the clergy, out of which opened the apse, with the bishop's throne in the centre, raised some steps above the floor, and the seats of the presbyters and deacons on each side. Between the bishop and the people stood the altar, generally raised over the crypt which contained the body of the saint to whom the building was dedicated. The narthex was usually preceded by an open court with colonnade and fountain. Attached to this was the Baptistery (q.v.).

A large number of basilicas still exist in Rome, dating from the 5th and 6th centuries up to the 10th. Churches in France and England were sometimes honoured by the pope's permission to assume the title of basilica.

Basilica, a code of laws of the Byzantine empire, the compilation of which was begun in the reign of the Emperor Basil I., the Macedonian, completed by his son Leo, the Philosopher, and first published in 60 books in 887. Constantine Porphyrogenitus, the son of Leo, prepared an official commentary to it, as well as a revised edition of the work itself. It was very much an adaptation of the code of Justinian to altered circumstances, and is of great value for the interpretation of the *Corpus Juris*. Apparently the code was at first called *The Revision of the Ancient Laws*, next *Herékontabiblos*, from its division into sixty books; and finally, before the end of the tenth century, it came to be called by its present name—apparently an elliptical form of *basilika nomima* ('imperial constitutions'). Some have supposed, however, that the name was derived from that of the Emperor Basil, as those legal forms instituted by his son were originally initiated by him. There are editions by Fabrot (7 vols. fol. Paris, 1647) and Heimbach (6 vols. Leip. 1833-70).

Basilicata, one of the sixteen 'compartimenti' of the kingdom of Italy, touching the Gulf of Taranto. It exactly corresponds with the official 'province' of Potenza (q.v.), the province being the administrative unit, the compartimento usually a conventional grouping of several of the 69 provinces.

Basilicon (Gr., 'royal,' or 'of great virtue'), a name given to four kinds of ointment, all of which contain the substances yellow wax, resin, and olive oil, along with other ingredients. Basilicon proper differs from *Yellow Basilicon* in containing suet and turpentine in addition to the above ingredients, while Burgundy pitch is also used in the preparation of the yellow ointment. *Black Basilicon*, or *Unguentum Tetracharmacum* (tetra pharmaka, four drugs), derives its name from containing one-fifth of black pitch along with the three drugs above mentioned. *Green Basilicon* contained verdigris, but has quite fallen into disuse. The resin, wax, and other ingredients of basilicon are melted together over a slow fire; the oil is then added, and the mixture, while hot, strained through linen. The straining is directed in consequence of the impurities which resin often contains. Basilicon ointment, or resin cerate, as it is usually called, is much used as a gentle stimulant application to blistered surfaces, indolent ulcers, burns, scalds, and chilblains.

Basilicon Doron (Gr., 'the royal gift') is the name of a work written in 1599 by James I. of England (then James VI. of Scotland) for his eldest son, Prince Henry. It expounds James's views as to the divine right of kings.

Basilides, one of the greatest of the Gnostics, who flourished at Alexandria about the year 125 A.D. Many of his fantastic speculations bear greater resemblance to the doctrines of Zoroaster, and in some points to Indian philosophy, than to the religion of Jesus. The first principle of all

things is the unborn and unknown Father, from whom emanated in succession *nous* ('mind'), *logos* ('the word'), *phronēsis* ('understanding'), *sophia* ('wisdom'), and *dynamis* ('power'). From the last sprung *dikaioynē* ('justice') and *eirēnē* ('peace'), and these seven with the Father formed the first Ogdoad, or octave of existence which originated the first heaven. From them emanated other powers which created the second heaven, and so on through the whole circle of emanations, which amount to 365, the mystic number so often inscribed on the symbolic stones in the Gnostic schools (see ABRAXAS STONES). Each of these angelic powers governs a world. There are, consequently, 365 worlds, to each of which Basilides gave a name. The *archōn* or head of the 365th, or lowest world, rules the material universe, which he also created. He is the God or Jehovah of the Old Testament, and when the earth was divided among the rulers of the material universe, the Jewish nation fell to the share of himself, who was the prince of the lowest class of angels. But wishing to absorb all power himself, he strove against the other angels, and to make them subject to his 'chosen people,' the result of which was war, strife, division in the world, together with the loss of the true religion, to restore which the Supreme God sent *Nous*, the first emanation who became incarnate in Jesus at his baptism. His disciples (Basilidians) were numerous in Egypt, Syria, Italy, and even in Gaul, where they continued to exist till the 4th century. Such mainly is the account of the teaching of Basilides given by Irenæus, and accepted by all until the discovery of the *Philosophoumena* of Hippolytus in 1842. According to this, Basilides started with a God unknown and unknowable by human faculties, rather than with a dualism of God and matter or evil, or with a theory of emanation. This non-existent God by his volition created the *pansperma*, or seed, the germ of all things, containing within itself three degrees of divine sonship: one pure, the second gross, the third requiring purification. The great *archōn*, sometimes called Abraxas, next sprung from the *pansperma*, ascended into the firmament, and produced a son greater than himself, by whose help he framed the world. Their rule—the Ogdoad—extends through all the etherial region down to the moon's sphere, where the grosser air begins—the Hebdomad, ruled by an inferior *archōn*, the God of the Jews. The process of enlightenment is thus: first, the mind of the son of the great *archōn* is illuminated; next, the light passes to the son of the *archōn* of the Hebdomad, then to Jesus, who instructs such of mankind as are capable of truth. Their souls go upwards; their bodies return to the primeval chaos. The three progressive periods of human enlightenment are thus the Ante-Jewish, the Jewish, and the Christian. See Baur's *History of the Church in the first three Centuries*.

Bas'illisk (*Basiliscus*), a genus of Central American lizards, in the family Iguanidae, differing, however, from the Iguanas in the absence of a dilatable throat-pouch and of thigh-pores, and in the presence of a continuous movable fin-like crest, with supporting spines, extending from the back along the tail. The back of the head also bears a hood-like sac, projecting upwards and backwards. The body is covered with small scales disposed in zigzag fashion, and there are teeth on the palatal bones. The colour shades off from yellowish-brown to white; the total length of the common form (*B. mitratus*) is about two feet; the diet is largely vegetarian. They are harmless, lively animals, climbing and swimming actively, and only in their quaint form suggesting any resemblance to the mythical basilisk of the ancients, which united all

the fearsome characteristics that wild imagination could invent (see below). The common hooded basilisk inhabits Guiana, Martinique, and

Basilisk (*Basiliscus mitratus*).

tropical South America generally, and extends northwards into Mexico. Another larger species (*B. amboinensis*) inhabits the islands of the Archipelago, and its tender flesh is much used for eating. See IGUANA, LIZARD.

The fabulous BASILISK (Gr. *basilikos*, diminutive of *basileus*, 'a king,' so named, according to

The Mythical Basilisk.

Pliny, from the spot on the head like a crown) was by ancient and medieval authors believed to be hatched by a serpent from an egg laid by a cock. It inhabited the deserts of Africa, and, indeed, could inhabit only a desert, for its breath burned up all vegetation; the flesh fell from the bones of any animal with which it came in contact, and its very look was fatal to life; but brave men could venture into cautious contest with it by the use of a mirror, which reflected back its deadly glance upon itself. Trevisa calls it the 'king of serpents that with smile and sight slayeth beasts.' It is described as about a foot long, with a black and yellow skin, and fiery red eyes; and its blood was supposed to be of great value to magicians. The weasel alone could contend with it, curing and reinvigorating itself during the combat by eating rue. The crowing of the cock was also obnoxious to the basilisk.

The word *basilisk* and its equivalent *regulus* are sometimes used in the Vulgate. The authorised English version of the Old Testament sometimes reads *adder*, and sometimes *cockatrice* (as in Isaiah xi. 8). The revised version reads *basilisk*.

The name was anciently applied to a large cannon, usually of brass, throwing a shot of about 200 lb. weight.

Basim, or BASSIM, a town of India, in the province of Berar, 413 miles E. by N. of Bombay. Pop. (1881) 11,576.—The fertile district of Basim has an area of 2958 sq. m., and 358,883 inhabitants.

Basin, in Geology, is a term applied to depressions in the strata, in which beds of a later age have been deposited. Thus, the London basin, consisting of tertiary sands and clays, occupies a hollow in the chalk, which is bounded by the North Downs on the south, and by the chalk-hills of Berks, Wilts, Bucks, and Herts on the north. The term has also been applied to synclinal depressions of strata, as the coal-basin of South Wales. Such

synclinal basins do not necessarily give rise to any corresponding depression at the surface of the ground. See ANTICLINE.

Basin of a river, in Geography, is the whole tract of country drained by that river. The line or boundary which separates one river-basin from another is called the watershed. By tracing these watersheds, the whole of a country or continent may be divided into a number of distinct basins; the basin of a lake or sea being made up of the basins of all the rivers that flow into it.

Basingstoke, a town in the north of Hampshire, 48 miles WSW. of London. It is a place of much activity, being situated at the junction of five main roads to London from the south and west of England, and it is also an important railway centre. Its chief buildings are the fine Perpendicular parish church, the town-hall (1832), and the corn exchange (1865); and it has a trade in corn, malt, coal, and timber. Basing House, 14 miles eastward, belonging to the Marquis of Winchester, for two years withstood the forces of the Commonwealth; but Cromwell at last took it by storm, and burned it to the ground, in 1645. The remains consist of the gate-house and a few walls and mounds. Pop. (1871) 5574; (1881) 6681.

Baskerville, JOHN, a celebrated English printer and letter-founder, was born in 1706 at Sion Hill, Wolverley, Worcestershire. A footman to start with, he afterwards became a writing-master in Birmingham, and from 1740 carried on the business of japanning there with great success. About 1750 he began to make laborious and costly experiments in letter-founding, and succeeded in making types which have scarcely yet been excelled. The quarto *Virgil* printed by him at Birmingham (1756), in Macaulay's words 'was the first of those magnificent editions which went forth to astonish all the librarians of Europe,' and which, 55 in number, included Milton, Juvenal, Congreve, Addison, the Bible, a Greek New Testament, Horace, and Catullus. He died, bequeathing £12,000, 8th January 1775. A foe to all that he termed 'superstition,' he chose to be buried in his own garden, whence, the ground being wanted for building purposes, his remains were exhumed in 1826.

Basket, a vessel of wickerwork, made of willows, reeds, cane, straw, bast, or other materials, interwoven. The origin of the word is very obscure. It has been conjecturally allied with Lat. *bascauda*, used by Juvenal and Martial, and by the latter given as British; but at present there is no evidence to connect the words. It is found in English since the 13th century, but it does not occur in the Teutonic or Romance tongues. In ancient Britain the shields of soldiers were formerly made of basket-work as well as their coracles or boats; the latter were made water-tight by being covered with the skins of animals. Similar boats are still used for crossing some of the rivers of India. Window-screens, chairs, pony-carriages, and screens are made of basket-work. Willows are largely grown in Holland, France, and Germany, though those most in request among basket-makers are grown in England in the valleys of the Thames and Trent. In several parts of England and Scotland, great attention is now paid to the cultivation of the willow; and judging from the statements of some of the cultivators, the returns yielded are very satisfactory (see OSIER, WILLOW). The tools required being few and inexpensive, a large number of poor persons are engaged in the manufacture of baskets, that are hawked about the streets by their wives and children. But a large proportion of these are of French manufacture, as is also the case with the

fancy baskets sold by blind asylums. Baskets are of all shapes and sizes, and their uses are so well known to all as to obviate the necessity of description here.

Basle. See BASEL.

Basnage, JAKUES, the son of an able advocate in the parliament of Normandy, was born in 1653 at Rouen, where he became pastor of the Reformed church. On the revocation of the Edict of Nantes (1685) he retired to Holland, and finally settled as minister of the Walloon church in the Hague, having gained the friendship of the Grand Pensionary Heinsius. Here, while zealously discharging his religious duties, he was called upon to take an active part in state affairs, particularly in negotiating the defensive alliance concluded between France, England, and the States-general in 1717. Amid all these duties and distractions, Basnage cultivated literature with ardour, and was no less distinguished for his extensive learning than for the polish of his manners and the integrity of his character. His chief works are of an historical nature. One of the best, a history of the Jews, has been translated into English (Lond. 1708). Basnage died September 22, 1723.

Basques (Spanish *Bascongados*), a curious race on both sides of the Pyrenees, forming, in spite of its small numbers, one of the separate folk-stems of Europe. Whatever may have been its ancient dimensions, their district is now limited to the Spanish provinces of Biscaya, Guipuzcoa, and Alava—the three so-called Basque Provinces—with part of Navarra; besides the French *arrondissements* of Mauléon and part of Bayonne, forming about a third of the department of Basses Pyrénées. The French part formed in ancient times the three territorial divisions, *Le Labourd*, *La Basse-Navarre*, and *La Soule*, embracing the valleys of the Bidassoa and Nivelle, of the Nive and Bidouze, and of the Saison, an affluent of the Gave d'Oloron. The Basque region in Spain forms, according to Elisée Reclus, about the thirtieth part of the surface of the peninsula. The boundary with France is a purely artificial one. The orographic system is very complicated; it may be compared to an inextricable knot binding the great chain of the Pyrenees to the plateau of the Castiles. Indeed the whole country is a medley of valleys, gorges, cols, passes, heights, and plateaus. Its general aspect is smiling and gay, save in the southern part of Navarre in the basin of the Ebro. In the French provinces one sees indeed abrupt and bare hill-slopes, but side by side with these the plains are cultivated, the mountains covered with firs, beeches, oaks, and chestnuts, with here and there fields of wheat or maize. A large portion of the surface is still uncultivated; often the soil is clothed only with an abundant natural vegetation consisting of ferns, gorse, and heath, made use of to provide litter for the cattle which are kept indoors the greater part of the year. Here and there appears a smiling homestead, its door always open, round it almost always a kitchen-garden or an apple-orchard. Agriculture is in a backward state—the only plough in the Spanish provinces is still the *laza*, a clumsy two-pronged fork as old as the Roman epoch. From the point of view of cultivation, the surface may be divided into two distinct parts—the high mountains covered with rich forests, and the plains divided into fields of maize and wheat, vines, kitchen-gardens, with meadows here and there, as well as apple and chestnut orchards. Of all the crops, that of maize is the most important. The Spanish provinces produce wheat, oil, cider, and those naturally heady

and well-coloured Navarre wines, stored in great goat-skin bottles, that have at least a high local reputation. Maize-bread (*mettore*), a poor quality of cider (*pitlara*), a highly seasoned soup of vegetables (*eltzekarri*), and a dish of green cabbages (*garbure*) are in general use. The foundries excepted, the industries are insignificant, and are mostly worked by strangers rather than the native race. During the last fifty years, but especially between the years 1865 and 1875, there has been a constant stream of emigration, chiefly to South America; and it has been estimated that no fewer than 200,000 Basques are at this moment in the Argentine Republic, in Mexico, and Cuba. Besides, young persons of both sexes, but more particularly girls, are constantly finding their way to the large towns in both France and Spain, of whom many marry and never return. But this is no new thing, for even two hundred years ago Basques were in high repute as servants, and we invariably find in the old French comedies a Basque lackey.

The question is often asked, are the Basques ethnologically of a uniform type? It was long believed that they were all brachycephalic, but the researches of Dr Broca, Dr Velasco, Virchow, and Antoine d'Abbadie, both on exhumed skulls and on living subjects, have proved that among the Basques there are two distinct types: a *dolichocephalic*, with a mean cranial capacity larger than that of modern Parisians, and a *brachycephalic*, with a smaller cranial capacity. It is impossible to determine which of these two cranial forms is the characteristic type, and which is anterior to the other. The Basques, then, do not form a pure race, and accordingly we find great variation in height, form, and above all in the colour of the eyes and hair. The Basque, like most peasants of Southern France, is strongly imbued with prejudices, with ancient superstitions, which Catholicism has not been able to eradicate; he is devoted to his peculiar customs, soft and complacent in his manners, but irascible and formidable in his anger; ardent and enthusiastic, but habitually serious; proud and independent, and gifted with a high sense of his personal dignity. His morals are pure and simple; his religious convictions ardent and sincere—there are few families that do not count a priest among their members. His stubborn independence is shown by the tenacity of his assertion of his ancient rights, the *Fueros* ('privileges') (q.v.); and the noble loyalty of his nature by his reckless allegiance to lost causes, notably to that of the Carlists, grandfather and grandson, in 1833-37 and 1872-76, which cost the Basques the last of their ancient and distinctive privileges. The decree of 9th July 1876 destroyed the last remnant of ancient Basque nationality, by introducing the conscription and the same taxation as in the rest of Spain. Two hundred years ago most of the Basques were sailors; they fished the whale and the Newfoundland cod, and we are even told that theirs was the commercial language of Canada. They have produced a large number of great seamen. If we need not believe that they discovered America before Columbus, it is at least true that Sébastien d'Elcano, the lieutenant of Magellan, who actually circumnavigated the globe, was a countryman. To-day nine-tenths of the natives are devoted exclusively to agriculture. The few who devote themselves to liberal studies make indifferent mathematicians, but show much taste for purely literary studies, especially poetry and works of imagination. This race has produced some creditable men of letters, as the Spanish poet Alonzo d'Ercilla; but a prouder boast is its claim to the paternity of one of the most remarkable institutions of modern times—Ignatius Loyola, the

founder of the order of Jesus, and Francis Xavier, the most devoted of its missionaries, were Basques.

The Basque still preserves part of his ancient and characteristic costume in the *béret* (*boina*), a blue or red cap, like the Scotch broad bonnet; the belt (*zinta*)—almost always red in France and blue in Navarre—and the short jacket thrown over his shoulder. His shoes are the hempen *espartinac* (Fr. *espadrilles*, Span. *alpargatas*). He wears no cravat, and is usually closely shaved; indeed the first care of the young Basque soldier on his discharge is to cut off the compulsory moustaches of the service. The old men usually wear the hair long. Young and old are armed with the *makhila*, a staff of medlar, loaded at its lower end, which can be hung to the wrist by a leather knot, and which, in the hands of an active fellow, is a formidable weapon. They are passionately fond of games, especially dancing and hand-ball (*pelote*); and there is no village without its *rebot*, where not only young but middle-aged men play in organised matches in presence of the whole village with marvellous vigour and agility. The only one of their distinctive dances that still survives is the grave *mutchiko*, the so-called 'Basque dance,' reserved for men alone. They sing much, their original songs being mostly in a minor key, the tone sad and sweet, the words expressing usually the sorrows of love. But the most remarkable of their distinctive institutions are the *Pastorales*, or Basque dramas, which now survive, however, only in La Soule, in the two French cantons of Tardets and Mauléon, where they are played every year, on the occasion of some great festival, spite of the opposition of the curés. Each *pastorale* is preceded by a long prologue, and terminated by a morality appropriate to the subject. The emphasis, the gestures, and the rhythm, are traditional as well as the costumes of the actors. The action is always very lively; the movements follow the rhythm of the singing, and in the scenes representing battles the combatants advance and recede regularly, while they repeat the first two and the last two verses of a quatrain, which Mr Webster compares to the strophe and antistrophe of a Greek tragedy. The good march calmly and majestically; the bad, with great steps and with horrible gestures; while the devils dance, leap, and run about continually. Usually the spectacle, which is preceded by a promenade of the whole troupe through the village, does not last less than seven or eight hours, yet the attention of the auditors is unbroken. Their impressions betray themselves by expressive interruptions; the death of a hero is usually accompanied by universal cries of 'Ai, ai!' and the discharge of pistol-shots. These *pastorales* have never been printed, but are learned by word of mouth during the long evenings of winter. They are all in Basque, from 3500 to 6500 lines in length (*Warwick* has 7116 lines), most of them in verses of eight feet, divided equally into strophes of four verses, of which the second rhymes with the fourth, the two others not rhyming. The measure is often very defective, and the rhyme merely a defective assonance. The unities of time and place are unknown, and the division into acts does not exist. The strangest anachronisms occur, and events succeed each other without the least transition. In one, that of *Claudius and Mar-simisa*, Mr Webster found a Roman emperor, a king of France, a Duc de Richelieu, a Pope Julius, a King Nero, Cardinal Baronius, and the grand Turk Mustafa. Charlemagne is represented with blue spectacles, a blue dress, white cotton gloves, a *makhila*, two gold chains, and the cross of the Legion of Honour or a Crimean medal. All of them tend ingeniously to the

honour of the Christian religion, and to the disgrace of Saracens and Mohammedanism. In all these figure pagan Turks, whom the devils aid, and whom the Christians always conquer or convert in the end. The date of these strange compositions thus points back apparently to the Spanish 'war of reconquest,' from the 13th to the 15th century. Many of them are mere survivals of the old medieval mysteries and moralities, even down to the very buffooneries, more or less gross, which distract the attention of the auditor. Mr Webster has since communicated to the writer his discovery that the *pastorales* are all composed directly from the French chap-books hawked about the country, the originals having actually been shown him by their authors. Of course indirectly through these they go back to the old *chansons de geste*. A good account of these chap-books is given in vol. ii. of Ch. Nisard's *Histoire des Livres populaires* (Paris, 1854).

Language and Literature.—The wonderful language of the Basques (by themselves called *Eskwara*, *Euskara*, *Uskara*, a word of uncertain origin, from which are formed the French adjective *Euscarien*, and the national name of the Basques, *Eskuoldunak* or *Euskaldunak*, 'those who have the Euskara') stands as yet absolutely isolated from all the tongues of Europe, and furnishes perhaps the only example of a consistently incorporating language. It belongs to the agglutinative division of languages joining on the varying to the permanent element of the word, and post-fixing for the most part the sounds which express the relations of grammar. It shows in some of its compounds a strange but merely casual analogy with the polysynthetic languages of America, and must be placed morphologically between the Finnic family, which is simply incorporating, and the North American incorporating and polysynthetic languages. Of course this statement is quite a different thing from a conclusion that Basque has any identity other than a singular analogy either with the Finnic or Magyar on the one side, or the Algonquin or Irokese on the other. It constitutes an independent stem of the agglutinative class, while the Uralic languages belong to another independent stem of the same class. Basque has no graphic system of its own, but employs the Roman character. Its general alphabet is very complicated; Prince Louis-Lucien Bonaparte counts 13 simple vowels and 38 consonants, and to these 51 phonetic elements we must add 6 diphthong-vowels and the aspirated consonants. The doubling of consonants is not permitted, and in actual speech many soft consonants are dropped. The letter *r* cannot begin a word. The cases are formed by post-positions, which may be added one to the other, and in the modern dialects the singular is distinguished from the plural only in the definite declension, where the post-fixed article is *a* in the singular and *ak* in the plural; as *gizona*, 'the man,' *gizonak*, 'the men;' *emakumea*, 'the woman,' *emakumeak*, 'the women.' The inflectional order of our language is thus inverted; instead of the grammatical modifications expressed by cases or by prepositions, Basque employs post-positions—suffixes always agglutinated to the noun: *zaldi*, 'horse;' *zaldia*, 'the horse;' *zaldia-aren*, 'of the horse;' *zaldiko*, 'of horse;' *zaldibat*, 'one horse,' &c. Some of the common suffixes are *k*, the mark of the plural and of the agent; *n*, 'in;' *i*, 'to;' *z*, 'by;' *ik*, 'some;' *ko*, *go*, *dik*, *tik*, 'of;' *kotzat*, *tzat*, *tzako*, *kiko*, 'for;' *kin*, *kaz*, *gaz*, 'with;' *gatik*, 'for;' *gan*, *baitan*, 'in;' *gandik*, 'from;' *ra*, *rako*, *ronz*, 'towards;' *gana*, 'to,' 'at,' &c. Of these suffixes some are joined to the definite, others to the

indefinite noun, or also to both. The personal pronouns are *ni*, 'I'; *gu*, 'we'; *hi*, 'thou'; *zu*, 'you.' There are still four demonstrative pronouns: *a*, *hura*, *hau*, *hori*, but traces of others now lost are seen in the flexions of the verb; *d*, as a third person, subject and object; *t*, as a first person, subject; as *dakust*, 'it see I,' from *d-ikus-t*; *doa*, 'he goes,' from *d-oa*. The pronoun 'self' is rendered by *buru*, 'head.' The relative pronoun is rendered by the suffix *n* agglutinated to the verbal flexion; its oblique cases by the interrogative pronoun *zein*. The other interrogatives are *nor*, 'who,' and *zer*, 'what;' as *nor da hor?* 'who is there?' *zein da haur?* 'what is this?' *Bat*, 'some one;' *batzu*, 'some' (plural); *bakoch*, 'each;' *batbedera*, 'every one;' *bana*, 'one by one;' *hanitz*, 'many;' *nor bait*, 'some-one;' *elkar*, 'each other,' are indefinite pronouns. The Basque has no genders, but it uses verbal forms of address, in which the sex of the person addressed is indicated by a special suffix, thus: 'I do not know him,' spoken to a woman, is *estakinat*; to a man, *estakiat* (for *estakikat*). The grammar would be simple but for the verb, which in the conjugation is exceedingly complicated. It incorporates the pronouns, having a different form for 'I have it,' 'I have it to you,' &c., as well as for addressing a woman, a man, a superior, and an equal. Thus, *dut*, 'I have,' generally speaking; *dinat*, 'I have,' to a man; *dinat*, 'I have,' to a woman.

In its present state Basque does not employ its regular verbal inflections, and has practically but two verbs, 'to be' and 'to have,' all other verbs being generally used as participles expressed in a periphrasis. This system consists in combining a verbal noun with an auxiliary verb, and, instead of saying *dakust*, 'I see it,' to say *ikusten dut*, 'I have it in seeing.' It is true that even at present the non-periphrastic conjugation is sometimes employed, and *estakinat* is still in use, as well as *dakust*, for *ikusten dut*. Spite of the apparent simplicity of the periphrastic conjugation, the number of forms possessed by the verbal noun and auxiliary verb are almost endless, and not only is there a different form for each of the personal pronouns, whether in the objective or the dative case, but there are also different forms for addressing a woman, an equal, a superior, or an inferior. The verbal adjective is the form given in the dictionary, and corresponds to a past participle, as *ikusi*, 'seen;' followed by the suffixes *ko* or *n* it forms a future and a conditional, as *ikusiko dut*, or *ikusiren dut*, 'I shall see it;' the verbal substantive is merely a locative, as *ikusten*, 'in the sight,' 'in seeing.' The various auxiliaries of use in the periphrastic conjugation are *ukan*, 'to have;' *eduki*, 'to hold;' *izan*, 'to be;' *edin*, 'can' (though this is doubtful); *esan*, 'may;' *eroan*, 'to move;' *joan*, 'to go;' *ibilli*, 'to move'—the last two already obsolete. Of the two principal auxiliaries, *eduki* is inflected like all other transitive verbs: *dadukat*, 'I hold it,' is formed from *d-eduk-t*, the *a* before *t* being merely a binding vowel, as *kt* could not be pronounced. The present tense forms of 'to have' are: for the singular, *daut*, *dauk*, *dau*; and for the plural, *dauzu*, *dauze*; or, more generally, *dut*, *duk*, *du*, *dugu*, *duzu*, *dute*. The imperfect tense forms are: singular, *neban*, *eban*, *eban*; plural, *genduan*, *zenduan*, *eben*; or, more generally, *nuen*, *huen*, *zuen*, *ginduen*, *zinduen*, *zuten*. The present optative forms are: singular, *duken*, *dukek*, *duke*; plural, *dukegu*, *dukezu*, *duket*; and imperfect: singular, *nuke*, *huke*, *luke*; plural, *ginuke*, *zinuke*, *lukete*. Such is the complete verb; its compound tenses are irregularly made up with the auxiliary *izan*, 'to be;' thus, 'I have had,' *izan dut*; 'I had had,' *izan nuen*. The transitive verbs are thus com-

pounded after the periphrastic method—e.g. from the verbal adjective *ikusi*, 'seen;' 'I see it,' *ikusten dut*; 'I saw it,' *ikusten nuen*; 'I have seen it,' *ikusi dut*; 'I shall see it,' *ikusiren dut*; 'I should have seen it,' *ikusiren nuen*; 'that I may see it,' *ikusi dezadan*; 'I can see it,' *ikusi dezaket*; 'I could see it,' *ikusi nezake*. The only irregular verb is *izan*, 'to be.' Its present indicative is: singular, *nais*, *aiz*, *da*; plural, *gara*, *zara*, *dirade*. The primitive conjugation of Basque verbs is now represented only by the auxiliaries of the modern periphrastic conjugation, which, according to Prince Louis-Lucien Bonaparte, has developed in all its dialects, eleven moods and ninety-one tenses (each of which has three persons in each number), variable according to the sex or rank of the person addressed; it receives besides a certain number of terminations, which perform the office of our conjunctions. The syntax of Basque, as of all agglutinative languages, is simple. The phrases are short. Composition is so common that it has caused several juxtaposed words to be contracted and reduced, so as to be partially confounded one with the other. This is the phenomenon known as *polyonymetism*, seen in the dialects of America, in which the words that make up a sentence are stripped of their grammatical terminations, and then fused into a single word of cumbersome length. Many words are simply formed thus: *odotea*, 'thunder,' is made up of *odei*, 'cloud,' and *otsa*, 'noise;' and *illabete*, 'month,' seems to be a compound of *illargi-bete*, 'full moon;' *illargi*, 'moon,' itself being composed of *il* or *hil*, 'death,' and *argi*, 'light.' The vocabulary is poor, and we find that there are no pure Basque words for abstract ideas; though this is denied by Prince Louis-Lucien Bonaparte. For example, there are no original words for 'tree,' 'animal,' 'soul;' God is simply 'the master on high;' and if they have a word for 'will,' the same must express 'desire,' 'fancy,' 'thought.'

The study of the language is rendered the more difficult by the extreme variability of its dialects. There are perhaps no two villages where it is spoken entirely alike. Prince Louis-Lucien Bonaparte recognises no less than twenty-five dialects, which, however, fall easily into eight great dialects, which again may be reduced to three. The eight dialects are: (1) The Labourdin, spoken in the south-west part of the arrondissement of Bayonne; (2) the Souletin, in the south-east of the arrondissement of Mauléon; (3) the Eastern Lower-Navarrese, in the north-west of the arrondissement of Mauléon; (4) the Western Lower-Navarrese, in the north-east of the arrondissement of Bayonne; (5) the Northern Upper-Navarrese, in some villages of Guipuzcoa on the French frontier, and in the part of Navarra bordering on the same province; (6) the Southern Upper-Navarrese, in the rest of Basque Navarra; (7) the Guipuzcoan, in the middle and eastern parts of Guipuzcoa; (8) the Biscayan, in Biscaya, Alava, and the western third of Guipuzcoa. The Souletin and the two Lower-Navarrese dialects form the first group, which may be called the *Oriental* division. The Biscayan alone forms the *Western*, and the four others form the *Central* group. These names are drawn from the territorial subdivisions, but the dialects do not correspond exactly. None of these provinces is entirely Basque except Guipuzcoa; Spanish Navarra is hardly half; only a tenth part of Alava along the northern frontier. A little less than a fourth part must be taken from Biscaya, and some Gascon villages from the arrondissements of Mauléon and Bayonne in France. Neither Bayonne, Pampeluna, nor Bilbao are Basque. In some villages of Spanish Navarra Prince Louis-Lucien Bonaparte has observed that

the men speak Spanish together; with the women they speak Basque, as do the women with each other. This ancient language, then, is manifestly disappearing, though very slowly, and besides it is being continually corrupted by the intrusion of foreign words, due to the exigencies of more complex modern life. Its use is strictly prohibited in the Spanish schools—'Euskarism' being a grave fault of which children must not be guilty. It is interesting to notice that in the French provinces it is French and not a patois that is superseding the Basque. By the aid of Prince Louis-Lucien Bonaparte's great *Cartes des Sept Provinces Basques*, published at London in 1863, it is possible to obtain approximately the number of persons who still speak this remarkable Pyrenean language. The total number in Europe is about 610,000; of these, 65,000 are in the arrondissement of Bayonne, and 60,000 in that of Mauléon, while 150,000 are found in Navarra, 180,000 in Guipuzcoa, 10,000 in Alava, and 145,000 in Biscaya.

Unfortunately the history of Basque is very short, and the few early allusions to it are meagre and uncertain. Beyond the eighteen words of Aimeric Picard's manuscript, discovered in 1881, and the few mentioned *en passant* by Lucio Marineo Siculo in his *Cosas ilustres y excelentes de España* (Alcala de Henares, 1539), we have scarce anything until the discourse of Panurge in chap. ix. of the second book of *Pantagruel*. This incomprehensible passage is not found in any of the editions of Rabelais' work anterior to that of Dolet (1541), and differs so much from the Basque of to-day as to be almost unintelligible. The oldest printed book in Basque dates only from 1545. This is the famous *Poesies Basques* of Dechepare (reprint, 'Edition Cazals,' Bayonne, 1874), a collection of poems, half devout, half amorous, the work of a curé of Lower Navarra. The next in point of age, but by far the most important of all Basque books, is the New Testament, translated by Liçarague, and printed at La Rochelle in 1571 by order of Jeanne d'Albret (reprint of the Gospel of St Mark, with notes, by M. Vinson, Cazals, Bayonne, 1874; and of that of St Matthew, by M. Van Eys, Maisonneuve, Paris, 1877). The next in importance is Axular's *Gueroco Guero*, in 1643, the most readable perhaps of all Basque books. The first essay at a Basque grammar appeared in 1638, in chap. xvi. of Oihenart's *Notitia ultriusque Vasconie*. But the study of the language really commenced with P. Manuel de Larramendi's Grammar, published in 1729, under the proud title, *El imposible vencido: Arte de la lengua Bascongada*. The first, however, to detect the true mechanism of the verb was the Abbé Darigol, whose *Dissertation critique et apologetique sur la Langue Basque* was published at Bayonne about 1827; but the earliest really scientific attempt to expound its conjugation was made by the Abbé Inchauspe in *Le Verbe Basque* (Bayonne, 1858). The best modern grammars are Prince Louis-Lucien Bonaparte's *Le Verbe Basque en tableaux* (Lond. 1869); Ribary's *Essai sur la Langue Basque* (M. Vinson's French translation from the Hungarian; Paris, 1876); W. J. van Eys, *Grammaire comparée des Dialectes Basques* (Paris, 1879); and the same writer's *Outlines of Basque Grammar*, in Trübner's series of 'Simplified Grammars' (Lond. 1883). The last two books contain some theories not generally adopted, and their value has been impugned by the criticisms of several scholars, notably Prince Louis-Lucien Bonaparte. Perhaps the best grammar on the whole is the *Grammatica de los tres Dialectos literarios del Vasconense*, by Don Arturo Campion (Tolosa, Guipuzcoa, 1886). The first attempt at a dictionary was that of P. de Larramendi, *Diccionario trilingue del Castellano, Bascuence y Latin* (San-Sebastian,

1745). A later book was Salaberry's *Vocabulaire des Mots Basques Bas-navarrais* (Bayonne, 1857). The Basque-French dictionary of Van Eys (Paris, 1874) and Aizquibel's Basque-Spanish dictionary (Tolosa, 1884) are the most accessible modern dictionaries. Such are the monuments for the study of this strange language, which, whether or no it was spoken in Paradise, according to Erro, at least baffled the devil to acquire. After seven years' diligent study in the Labourd country, he had only two words, *bai*, 'yes,' and *ez*, 'no,' and even these fled from his memory as he crossed the Pont Saint Esprit of Bayonne.

There exists no national Basque literature properly so called. The five or six hundred volumes in the language are translations from the French, the Spanish, or the Latin; and the few original works have been thought and written by persons who have received an education completely French or Castilian. Many of the books are merely translations of such books as the *Imitation*, the *Spiritual Combat* of Scupoli, the *Devout Life* of François de Sales, or collections of devout meditations, hymns, and prayers. Much more interesting than these is the oral literature of the country, though here there is little that is original and spontaneous, even in the songs, children's rounds, riddles, formulas for games, proverbs, and stories. The *pastorales*, already spoken of, come first in interest; but their claim to originality has been rudely shaken by Mr Webster's startling discovery. But this primitive people preserves its legends with a tenacity that is striking in the last quarter of the nineteenth century. Its stories show the strangest intermixture of ancient with totally new ideas. They are still told by the peasants in the long winter nights, at their prolonged wedding or other feasts, or at the gatherings from time to time to strip the husks from the ears of maize. They are still literally believed in, however much they may seem to contradict modern notions of everyday life. They are *lege zaharreko istorriak*, 'histories of the ancient law.' They are arranged by Mr Wentworth Webster in his *Basque Legends* (1877) in the following seven divisions, containing forty-seven stories: (1) Legends of the Tartaro, or Cyclops; (2) of the Heren-Suge, or Seven-headed Serpent; (3) purely Animal Tales, which are neither fables nor allegories; (4) of Basa-Jaun, Basa-Andre, and of the Lamifak, or Fairies; (5) Tales of Witchcraft and Sorcery; (6) Contes des Fées; and (7) Religious Tales and Legends. The collection of M. Julien Vinson, *Le Folk-lore du Pays Basque* (Paris, 1883), which has a somewhat wider extent than Mr Webster's, is divided into *Contes et Récits*; *Chansons*; *Formules d'Élimination*, *Rondes*, *Contilènes*, *Dictons*; *Devinettes*; *Proverbes et Dictions*; and *Pastorales*. The stories are thirty-six in number. The Tartaro is a one-eyed Cyclops, closely resembling the monster of Greek mythology. He lives in a cave among his flocks, and is blinded with a red-hot spit by the hero, who escapes by means of the monster's own sheep. It is perfectly possible that the Greek myth may have been borrowed by the colonists in Sicily or the voyagers to Tartessus from some ancient Basque population. The seven-headed serpent recalls the dragon of chaos in Accadian mythology which tempted man to sin, and waged war with Merodach. Basa-Jaun, 'the wild man,' is a kind of satyr or wood sprite; his wife, Basa-Andre, 'the wild woman,' is a kind of sorceress or land mermaid. The Lamifak are true fairies. The legends of witchcraft, as Mr Webster points out, are very poor, not because the belief in witches is extinct, but because it is so rife. The stories are told as matters of fact by the narrator in their own words, quite different from the way in which the

legends are narrated in the traditional words, like a text learnt by heart. Witchcraft with them has not yet reached the legendary stage. Indeed it is almost as firmly believed in as it can have been at the beginning of the 17th century, when we know from Pierre de Lancre, the good councillor at the Parlement of Bordeaux, that the Labourd was the chosen home of sorcerers. In his four months' inquiry, May to October 1609, he took the depositions of more than five hundred witnesses, and sent to their doom as many as sixty victims, of whom at least five were priests. (The process is detailed in his *De l'Inconstance des mauvais Anges et Demons*, 1610 and 1613.) Not only the Basque inclination to sorcery, but their tobacco-smoking, their dancing and their swimming, are severely censured by the rigid councillor. One good reason offered for the levity and inconstancy of the people is that they make so much use of the apple, the fruit of transgression, not only eating its fruit but drinking its juice. Many of the *Contes des Fées* show a close but hitherto unexplained similarity to Celtic legends, as recorded in Campbell's *Tales of the West Highlands*; while others are obviously derived directly from the French. The Religious Tales are specimens of a literature which in medieval times rivalled in popularity and interest all other kinds of literature put together. 'Their grossness and rudeness,' says Mr Webster, 'to a great extent hide from us their real tenderness and true religious feeling; but they were, doubtless, to those who first heard them, and are still to those who now recite them, fully as instructive, and have quite as beneficial, purifying, and ennobling influence on them as the most polished and refined of the religious tales of the present day have on the young of our own generation.' Beside the invaluable collections of Mr Webster and M. Julien Vinson already referred to, as many as 110 stories have been printed by M. Cerquand in his *Légendes et Récits Populaires du Pays Basque* (four parts, Pau, 1871-82).

History.—The early history of the Basque race is as yet entirely uncertain, but so far it appears that at no time in history was there any Basque nationality properly so called, nor can we go back with any kind of historical certainty to a time when they were more than a small tribe of rudimentary civilisation, located more or less widely in the valleys of the Western Pyrenees. The medieval historians speak of a mountain population, variously named *Cantabres*, *Vascons*, &c., but are unanimous only in the unflattering terms in which they describe them. The pilgrims who crossed the Pyrenees eight or nine centuries ago feared to meet them. In the year 1120 the Bishop of Porto assumed the disguise of a beggar in order to pass safe and sound through the midst of men who were 'murderers, always ready for mischief, cruel and unrestrained, and who spoke 'an unknown tongue.' It was doubtless they who, three centuries before, had plundered the rear-guard of the Frankish army, and slain the Roland of romance. The French pilgrim, Aimeric Picard, already referred to, speaks of the plundering habits of the mountain people, and of the severe tolls they levied from wayfarers, but testifies that they were good Catholics withal. A formal sentence of excommunication was declared at the third Lateran Council in 1179 against 'the Basques and Navarrese,' who 'practise so many cruelties upon Christians, plundering and ravaging just like pagans . . . without regard to sex or age.' The evidence of the hagiographers is to the same effect: among the many martyrs was St Léon, the first Bishop of Bayonne, killed about the end of the ninth century by 'pirates very cruel and satellites of the

devil.' In the pages of Gregory of Tours, Trédégaire, Isidore, and others we find frequent notices of the plundering ravages of the mountaineers, and from time to time of more or less successful expeditions to punish them by the rulers on both sides of the Pyrenees. The waves of Moslem invasion hardly reached the base of their mountains, but hither fled the remnants of the routed Christian armies, and here began the reaction which was to result in the 'reconquest.' The peoples who then inhabited the northern provinces of Spain, and who had remained independent, had at least the hatred of the eastern conquerors in common, and gradually, under the guidance of enterprising leaders, they grouped themselves together, and formed a number of republics or federal states, from which grew the kingdoms of Asturias in the west; of the Sobrarbe, then of Navarra and Aragon, in the east; and the 'lordship' of Biscaya. Alava, nearer the Moors, constituted a *Behetria*, a word not understood exactly, but at least the government of the province was essentially oligarchic. Guipuzcoa and Labourd do not appear to have been raised to the dignity of distinct states, but merely to have comprised a number of territorial federations designated by the Spanish name of *Hermandades* ('fraternities'). La Soule and Lower Navarre were dependent upon the kingdom of Navarre and followed its fate; they comprised a number of vassal *vicomtés*, of which that of Soule had the longest history. The Labourd formed a *vicomté* under the dukes of Vasconie, afterwards of Aquitaine. Meantime the struggle with the Moors went on with varying issue—the most glorious day was the 16th of July 1212, when the kings of Navarra, Aragon, and Castile together overthrew the Mussulmans in the plain of Las Navas de Tolosa. Trophies of the victory may be still seen in the churches of Pampeluna and Roncevaux, and from that day on the shield of Navarra have figured the famous chains.

The fundamental history of all the Spanish states depends on the part they played in the 'reconquest.' Certain special privileges (*Sp. fueros*, *Fr. foras*) became attached to particular districts, dating from the time when these were granted in the face of a dangerous enemy, and later were exacted from the king or count at the settlement of the reconquered lands. All the provinces in the north of Spain had *fueros* of this nature, which insured to them not merely exemption from particular imposts or burdens, but something like an actual autonomy, consisting chiefly in a more or less absolute exemption from compulsory military service, the right to free-trade, especially in tobacco and salt, the payment of taxes in a lump, and government through provincial *juntas* and officials born in the country. These *juntas*, which met every year at fixed times in some central building, or, as in Biscaya, under the famous oak of Guernica, consisted of members elected by the countrymen, and with them sat the *corregidor* or representative of the king, and the intermediary between the local and the central authority. In the French provinces a *syndic* corresponded to the *junta*; a royal *bailli*, to the *corregidor*. These provinces did not consider themselves as forming an integral part of France or Spain, but were connected by the personal bond of the sovereign alone, just as the grand-duchy of Luxemburg is to the kingdom of the Netherlands at the present day. Thus the States of Lower Navarre refused in 1649 to send deputies to the States-general of France; and in 1789, when the unity of France and its division into departments had been decreed, the representatives of that little 'kingdom' withdrew from the National Assembly. The Spanish provinces long watched with the most jealous care

any encroachment of the crown upon their fueros. It was only in 1812, at the time of the Napoleonic usurpation, that Navarra for the first time sent representatives to the general cortes of the kingdom—to the famous Cortes of Cadiz. Biscaya was annexed to Spain by a treaty in 1356; the *hermandades* of Guipuzcoa finally united themselves with Castile in 1200; while Alava, long under a particular fraternity of nobles with an elective over-lord, finally yielded its rights by formal treaty to the king of Castile in 1332. In virtue of these conventions the kings of Navarra, and later, for the three other Basque provinces the kings of Spain, on their accession to the throne, swore solemnly to maintain the fueros of the provinces. In Biscaya this ceremony took place under the oak of Guernica. During the insurrection of 1873-76, Don Carlos the younger revived the ancient ceremony. It was thus celebrated for the last time, for the Spanish government in 1876 suppressed the privileges of Alava, Guipuzcoa, and Biscaya, just as it had those of Navarra in 1839, after the first Carlist insurrection.

The origin of the Basques is one of the most vexed questions of ethnology and philology alike. The controversy was first turned into a totally new direction by the publication at Berlin, in 1821, of W. von Humboldt's famous *Prüfung der Untersuchungen über die Urbewohner Hispaniens vermittelt der Waskischen Sprache*. (See especially M. A. Marrast's French translation, 1866, with its valuable introduction, containing a summary of the progress of the Basque question since Humboldt's time.) The great German savant's argument was that the Iberians were a people spread over Sicily, Sardinia, Corsica, the Spanish Peninsula, Southern France, and the British Isles, and that the modern Basques are the remnant of this race elsewhere expelled or absorbed. The main evidence offered was an attempted explanation of a large number of Spanish and other place-names by the known significations and forms of Basque words. This bold hypothesis long found enthusiastic support, but has since been much modified even by its own supporters. It was assailed by Grasilin in *De l'Ibérie* (Paris, 1838), and with especial vigour, along Grasilin's lines, by M. J. F. Bladé in his learned *Origine des Basques* (Paris, 1869), in which it is maintained that Iberia was never more than a geographical term, that no proper Iberian race ever existed, and that the Basques were always shut in by alien races, their own affinity being as yet absolutely unknown. W. J. van Eys and M. Vinson are almost equally sceptical, maintaining indeed that we cannot at present say more than that the riddle is as yet entirely unsolved. Meantime, however, other scholars have continued to offer their hypotheses, and indeed competent scholars like Prince Louis-Lucien Bonaparte and M. Luchaire have maintained the value of some of W. von Humboldt's results. Anthropological research has proved the existence of a Neolithic race in Europe, of small stature, with long or oval skulls, and this race has been confidently identified with the Basques and Iberians. Mr Boyd Dawkins, in several previous papers, and further in his interesting and valuable *Early Man in Britain* (1890), has found the Iberian characteristics in 'the small dark Highlander,' 'the small swarthy Welshman,' and the 'Black Celts to the west of the Shannon.' Mr Webster, in his paper, 'The Basque and the Kelt,' printed in the *Journal of the Anthropological Institute* (vol. v. 1876), replying to an article by Mr Dawkins in the *Fortnightly Review* for September 1874, disposes of the identity between the dark Kelts and the Basques, by proving that the

Basques are a mixed race, exhibiting a fair as well as a dark variety, and that the former is on the whole the larger half of the present population. In the discussion that succeeded the reading of this paper, Mr Webster was followed by no less eminent a circle of specialists than Prince Louis-Lucien Bonaparte, Professor Sayce, and Mr W. J. van Eys. Professor Sayce pointed out that the Basques, physically and linguistically, are the representatives of a race that preceded the Kelts, and were driven by them into the mountain fastnesses of the extreme west, just as the Finns were by other Aryan tribes in the north. Professor Rhys failed to find many points of similarity between Basque and Keltic, of such a kind as would suggest that the Keltic nations had at any time absorbed Basque ones. Beyond this point the question cannot at present be carried, nor need the inquirer allow his mind to be distracted by assertions unfortified by patient proof. In the meantime, however, it must always be remembered that language and race are not convertible terms, and while the Iberians of ancient Spain probably spoke languages allied to the dialects of the Eskuara, so far there is no proof worth anything that all the tribes called Iberian by classical writers shared the heritage of a common speech. A flood of light may yet be poured on this question, whenever the so-called Celtiberian inscriptions and coins—the *letras desconocidas*—shall be deciphered. But these still await their Champollion. There is as yet no collection containing all these inscriptions, together with the coins: on the latter the chief works are those of Heiss, Boudard, and Saulcy in French; and Delgado, Zobel de Zogroniz, and Puyol y Campo in Spanish. There have been many clever theories and attempts at interpretation, but none as yet has gained a recognised authority. But when the day of true interpretation comes, it will mark a great advance in European archaeology, and especially in our knowledge of the Basque question.

Many worthless books on the Basque language and history have been printed and reprinted, even under the shelter of famous names. Besides the works on the people, or their literature and history already named, the following should be read: Mahn, *Denkmäler der Baskischen Sprache* (Berlin, 1857); Michel, *Le Pays Basque, sa Population, sa Langue* (Paris, 1857); Prince L.-L. Bonaparte's *La Langue Basque et les Langues Finnoises* (Lond. 1862); J. F. Bladé's *Dissertation sur les Chants heroïques des Basques* (1866); Salaberry's *Chants populaires du Pays Basque* (Bayonne, 1870); Cénac-Moncaut, *Histoire des Peuples Pyrénéens* (3d ed. 4 vols. Paris, 1874), to be read with caution; W. J. van Eys, 'La Langue Ibérienne et la Langue Basque' in the *Revue de Linguistique* (vii. 1874); J. Vinson, 'La Question Ibérienne' in *Mémoires du Congrès scientifique de France* (ii. 1874); Paul Broca, 'Sur l'Origine et la Répartition de la Langue Basque' in the *Revue d'Anthropologie* (vol. iv. Paris, 1875), to be read with caution—the linguistic map is of but little value; José Manterola's *Cancionero Vasco* (3 vols. Saint-Sebastian, 1877-80); and Vinson, *Les Basques et le Pays Basque* (Paris, 1882)—an excellent summary, to which as well as to the same scholar's article in the *Dictionnaire des Sciences Anthropologiques*, and to the grammar of Mr W. J. van Eys, the foregoing pages have been especially indebted.

Basra (also *Bassora* or *Bussora*), a town of Asiatic Turkey, is situated on the western bank of the Euphrates, here called the Shat-el-Arab, 56 miles from its mouth in the Persian Gulf. The river, which is navigable up to Basra for ships of 500 tons, is there divided into a number of channels, and by evaporation and frequent over-

flowing, makes the climate very unhealthy. Most of the houses are low huts, built of unburned bricks. The population, once 150,000, had sunk in 1854 to 5000, but the establishment of the English Tigris and Euphrates Steamship Company has altogether changed the prospects of Basra, and the town now probably contains at least 40,000 inhabitants, most of them actively engaged in commerce, notably in the exchange of the productions of Turkey and Persia for Indian and European goods, particularly articles of British manufacture. Basra was founded in 636 by the Calif Omar, and soon became one of the most famous and opulent cities of the East. The possession of it has been the subject of many contests between the Turks and the Persians. It is a place of great note in the history of Arabic literature.

Bas-relief. See RELIEF.

Bass, MICHAEL THOMAS (1799-1884), of the famous Burton brewing firm of Bass & Co., founded by William Bass in 1777, was the son of M. T. Bass; he joined the business on leaving school, and afterwards acted as traveller. The Exhibition year of 1851 gave a great stimulus to the business of Bass & Co.; and now about 3000 persons are employed in the breweries. The average annual amount of business assessed in 1882 was at the rate of £2,400,000, and the yearly issue of labels is over 100,000,000. From 1848 till 1883 Bass represented Derby in the Liberal interest. His benefactions were very numerous, and included the building and endowing of St Paul's, Burton, the total expenditure on the parish being about £100,000; and recreation grounds, a free library, and swimming baths for Derby, at a cost of £37,000. Of simple tastes, he declined more than once a baronetcy and a peerage. Both honours were conferred on his son, M. A. Bass—the former in 1882, and the latter in 1886, when he took the title of Baron Burton.

Bass, or **BASE,** in Music, is the deepest or lowest part, by whatever instrument it may be performed. Next to the upper part the bass is the most striking, the freest in its movements, and richest in effect. In respect to harmony, the bass is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed that most important and effective figure in music called 'Organ-point' (q.v.).—Bass is also applied to the lowest and deepest male voice. The compass of a bass voice is generally from F below the bass clef to D above it, which should all be chest-notes, except, perhaps, the highest. Exceptionally deep voices are found in Russia, descending to C below the bass clef, and even further. The bass voice begins to show itself only at the years of manhood, and is generally a change from the alto voice of a boy. It is much more largely used as a solo voice, especially in opera, since Mozart gave it prominence.—Bass or Bass Viol is also the name of an old stringed instrument, with from five to six strings, tuned variously to suit the music, and played with a bow. It was a sort of middle instrument between the contra-bass and violoncello, but is now out of use. Double bass (contra-bass) is the deepest-toned of stringed instruments, and the foundation part of the modern orchestra. There are two varieties, one with three strings, and the other with four; besides a smaller instrument known as the *basso di camera*, used by solo players. See THOROUGH BASS.

Bass, THE. See BASS ROCK.

Bassadore, the principal station for British ships in the Persian Gulf, situated at the west end of the island of Kishm.

Bassano, a walled town of Italy, in the province of Vicenza, on the Brenta, 30 miles N. by

W. of Padua by rail. It has a cathedral, and in the tower of Ezzelino is a fine library. Printing is the chief industry; and there is some trade in wine, olives, silk, and leather. In the neighbourhood Napoleon defeated the Austrian field-marshal Wurmser in 1796. Pop. (1881) 6086.

Bassano (or, more properly, GIACOMO DA PONTE), an artist of eminence, was born at Bassano in 1510, and studied for some time at Venice. He may be said to have founded a school, whose peculiarity was the delineation of common things, markets, fairs, cattle, and country scenes; but his famous altar-piece of the 'Nativity,' at Bassano, shows his power of handling sublimer subjects. The special merits of his style are its vigorous and picturesque colouring, and its accurate imitation of nature. He died in 1592, leaving four sons, who all followed their father's profession, but were not marked by any special originality of manner.

Bassas, two ledges of rocks to the south-east of Ceylon, distinguished as *Great* and *Little*—the former group being more to the south-west, and the latter, the most dangerous of the two, more to the north-east. They lie in 6° 11'–6° 22' N. lat., and in 81° 28'–81° 43' E. long. On both are lighthouses.

Basse (*Labrax*), a genus of marine fishes of the Perch family. They were known to the Greeks under their generic title, and Aristotle noted the rough teeth on the tongue, the scales on the gill-cover, and the spines on one of the gill-covered bones (*operculum*), which distinguish them from the ordinary perches. The British species (*L. lupus*, or formerly *Pera labrax*) migrates in shoals, from June onwards, to the south coasts of England and Ireland; often ascends rivers, and has been improved by captivity in fresh-water ponds. It is often taken by the small seine-net, or by the trolling rod with sand-eel bait, and it will rise to the fly. The Romans called it *Lupus* (its present specific name) in reference to its voracity, and ancients and moderns unite in the appreciation of its delicacy. The shape is salmon-like, and in Kent it is called the White Salmon or Salmon-dace. There are two dorsal fins, the first spinous, the second flexible. The colour is without the zebra-like bars of the perch, and shades off from dusky blue above to silvery white beneath, where it is as 'bright as a new shilling.' It weighs as much sometimes as 15 lb., but usually much less.

The Striped Basse or Rock-fish of the United States (*L. lineatus*) very nearly resembles the Common Basse, but attains a larger size, and is marked by seven or eight longitudinal black lines. The name Stone Basse is given to various forms, but especially the *Polypriion cernium*, a fish very rare on the coasts of Britain, but abundant in more southern parts of the Atlantic Ocean, and found on the American coasts and in the Mediterranean. In general appearance it resembles the common perch more nearly than the basse, but differs from both in having only a single elongated dorsal fin. It is sometimes called the Wreck-fish in reference to the way in which it follows wreckage, or ships on which barnacles are growing, and this it does apparently for the sake of small animals associated with the barnacles. It is easily taken, and is esteemed excellent for the table.

Bassein, (1) a thriving town in Burmah, on the left bank of the Baasein River, one of the mouths of the Irawadi, 75 miles from the sea, but accessible to the largest ships. It is an important centre of the rice trade, has considerable trade with Madras, and in a military view also is important, as it completely commands the navigation

of the stream. It was captured by the British in 1852, since which time the commerce has greatly increased. Pop. (1881) 28,147. The district of Bassein, in the division of Irawadi, has an area of 7047 sq. m. Rice is the chief crop, with cotton, sesamum, and tobacco. Pop. (1881) 389,419.—(2) Bassein, a decayed town in the province of Bombay, 28 miles N. of Bombay, and 5 miles from Bassein railway station. Ceded to the Portuguese in 1534, it was a place of much importance as late as 1720, and its remains still point to a high state of former splendour. In 1765 it was wrested from them by the Mahattas, and in 1780 surrendered to the British, after a regular twelve days' siege. Pop. (1720) 60,499; (1882) 10,357.

Basse-terre (Fr., 'lowland'), three places in the West Indies.—(1) The capital of St Christopher's or St Kitt's, and the seat of its legislative council, on the west coast, is a low, hot, dusty place, standing at the outlet of a lovely valley of the same name. Its population is about 8500.—(2) Capital of the French island of Guadeloupe, giving its name, moreover, to the larger of the two islets into which Guadeloupe is divided; pop. about 9500.—(3) The chief town of Marie Galante, a dependency of Guadeloupe, which is about 12 miles to the NW.

Basset Horn (Ital. *corno di bassetto*), the richest and softest of all wind-instruments, invented in Passau in 1770, improved by Lotz in Presburg in 1782. It is similar to a clarinet in tone and fingering, but has additional low keys, extending its compass to C in the bass clef, sounding, as the instrument is tuned in F, the F below.

Bassinet. See HELMET.

Bassompierre, FRANÇOIS DE, Marshal of France, was born in 1579 at Harouel, in Lorraine, and came at the age of twenty to the French court, where he gained the favour of Henry IV. Appointed colonel of the Swiss Guards after the king's murder, he was raised to the rank of Marshal of France in 1622; was sent on embassies to Spain, Switzerland, and England; and bore an active part in the siege of La Rochelle. He became, however, an object of suspicion and dislike to Richelieu, who caused him to be cast into the Bastille in February 1631, from which he was not liberated until 1643, after the death of Richelieu. He himself died in 1646. Bassompierre was an accomplished courtier, extravagant in luxury, and excessively addicted to gallantries. At the time of his arrest he destroyed 6000 love-letters. The best edition of his *Journal de ma Vie*, written in the Bastille, is by the Marquis de Chantérac (4 vols. Paris, 1870-77).

Bassoon (Ital. *fagotto*), an important wind-instrument of the reed species, made of maple-wood or plane-tree. The bassoon is an Italian invention; its name *fagotto* meaning 'a bundle,' probably from its being made in different pieces laid one against the other. The French call it *Basson de hautbois*; the Germans retain its Italian name. Its invention is attributed to Afranio, a canon of Ferrara, about 1539, but in some form it has existed from the earliest times. In the middle of the 16th century it had already reached great perfection. Sigmund Schnitzer, in Nuremberg, who died in 1578, was a celebrated maker. Those by

Savary, a French maker, are now highly esteemed. The bassoon consists of a bored-out tube of wood in several pieces, fixed together alongside each other, the bore being conical, and doubled upon itself, so as to bring the holes and keys within the reach of the fingers of each hand. The bassoon has in general not less than 7 holes and 10 keys. In the narrow end of the wooden tube is fixed a small tapering brass tube in the form of an S, on the end of which is placed the reed for producing the tone. The compass of the bassoon is from B flat below the bass stave, to C in the treble. The fingering is complicated and variable in different patterns. The notes for the bassoon are written on the bass clef for the lower part, and on the tenor clef for the higher. The best keys for the bassoon are E flat, B flat, F, C, G, D, and A; all the other keys are difficult. It is scarcely known as a solo instrument, though there is some music for it as such—among others, concerti by Mozart and Weber; but it plays an important part in the modern orchestra, its tone being capable of very varied expression. The double bassoon (*contrafagotto*) is of similar construction, but sounds an octave lower. Bassoon is also the name of an organ-stop, the pipes of which are made to imitate the tones of the instrument.

Bassora. See BASRA.

Bassora Gum. See GUM.

Basso-rilievo. See RELIEF, SCULPTURE.

Bass Rock, a remarkable island-rock of Had-dingtonshire, near the mouth of the Firth of Forth, 2 miles from Canty Bay, and 3½ miles ENE. of North Berwick. Confronted by the ruins of Tantallon Castle, and composed of volcanic greenstone and trap tuff, it is about a mile in circumference, nearly round, and 313 feet high. It is inaccessible on all sides except the south, where it shelves down to the water, and there the landing is difficult, almost impossible when there is any swell. On the west, north, and east, the cliffs rise sheer out of the sea. They are denized by countless numbers of solan geese and other birds, which give the rock a snowy appearance in the distance. A cavern tunnels the rock from west to east, and is accessible at low tide. In 756 St

Bass Rock from the Shore.

Balthere or Baldred died in a hermitage on the Bass Rock; in 1316 it came into the possession of the Lauder family. In 1671 Charles II. purchased it for £4000, and within its dreary dungeons many

Bassoon.

16th century it had already reached great perfection. Sigmund Schnitzer, in Nuremberg, who died in 1578, was a celebrated maker. Those by

of the most eminent of the Covenanters were confined during his and James II.'s reign. The Bass was the last spot in the British Islands which held out for the Stuarts. Four young Jacobite prisoners had the address to capture, and, with twelve more who joined them, to hold it for King James, from June 1691 till April 1694, against all the forces which William III. sent against them; at last the spirited little garrison surrendered on honourable terms, and only from a consciousness of failing provisions. In 1701 the fortifications were demolished. Five years afterwards the Bass passed into the possession of Sir Hew Dalrymple, to whose descendant it now belongs. The Bass is let to a 'keeper,' who pays a certain sum for it annually, the rent being made up by the sale of young geese, eggs, feathers, and oil, as well as by fees exacted from visitors to the rock. See an interesting volume on the Bass, by Hugh Miller and four others (1848).

Bass Strait, the channel which separates Tasmania from Australia, contains many islands, chiefly in its southern section, and is greatly beset by coral-reefs. It runs almost due east and west, is about 180 miles long, and has an average breadth of about 140 miles. It was named after Dr George Bass, surgeon of H.M.S. *Reliance*, who settled the question as to the existence of the channel between Australia and Tasmania. After a preliminary voyage, he sailed round the latter in 1798 in a barque of 25 tons, and proved it to be an island.

Bass Tuba. See SAXHORN.

Bast, or *PHLEUM* (formerly often called *Liber*, *Inner Bark*, or *Endophloem*; see BARK), is a term applied by botanists to distinguish that portion of the fibro-vascular bundle which is characterised by the presence of sieve-tubes, from the woody portion which is distinguished by the presence of vessels (see BARK, VEGETABLE HISTOLOGY, DICOTYLEDON, &c.). These sieve-tubes (which are produced by the union of cell-rows, and are in communication by means of protoplasmic threads through oblique sieve-like partitions) are, like the wood-vessels, accompanied by a residue of undifferentiated cells, the *bast parenchyma*. These two elements constitute the *soft bast*, and through this layer the elaborated sap descends from the leaves throughout the plant. This region is recognisable under the microscope by the exceeding

e, bast fibres; *f*, cells of soft bast; *g*, vessel of soft bast, with four perforate sieve-plates seen on the surface of an oblique septum; *g'*, section through septum and sieve-plates.

delicacy and transparency of the walls of sieve-vessels and bast parenchyma alike, and by the presence of protoplasmic contents; while in longitudinal section, the characteristic 'sieves' (which are not, however, always very easy to observe) furnish an additional characteristic (see fig.). In the soft bast also there may frequently occur *Laticiferous*

Vessels (q.v.), but these are by no means essential to its structure. Juxtaposed to this soft bast we find the hard bast, which is entirely composed of cells, greatly elongated and thickened into the *bast-fibres*, and to this the important mechanical properties of bast (and consequently, for the most part, the strength, hardness, and toughness of bark) are essentially due. A bast-fibre has frequently a breaking strain greater than that of steel, and the varied economic applications of bast essentially depend upon the fineness and toughness of the fibre; thus the fibres of hemp, flax, jute, &c. are nothing else than bast. The name bast, however, is more usually applied to the inner bark of trees, and is common to the Teutonic languages, designating the inner bark of the Lime-tree (q.v.) or linden-tree, which is employed for making a coarse kind of ropes, mats well known as *bast-mats*, and a kind of shoes much worn by the Russian peasantry. The trees are cut when full of sap in spring. For bast to be plaited into shoes, young stems of about three years old are preferred; and it is said that two or three are required to make a single pair of shoes. Trees of six or eight years old are cut down for the better kind of mats, which are exported in large quantities from Russia, particularly from the port of Archangel, and which are much used for packing furniture, covering tender plants in gardens, supplying strands with which plants are tied, &c. The trees from which the bast is taken are very generally burned for charcoal. After the bark is dried, its layers are easily separated by steeping in water. The finest layers are the inner, and the coarser are the outer ones.—The manufacture of bast-mats is nearly confined to Russia and Sweden. Lime-tree bast is used in the south of Europe for making hats. The name *bast-hat* is, however, very often given to a hat made of willow-wood planed off in thin ribbons, and plaited in the same manner as straw-hats. The inner bark of *Grewia didyma*, a tree of the same natural order as the lime-tree, is used for making ropes in the Himalaya Mountains.

Bastard, an old French word denoting the 'son of a *bast*,' or pack-saddle, as opposed to a child of the lawful marriage-bed. Bastards, as described by Blackstone, are such children as are not born either in lawful wedlock, or within a competent time after its determination. The Scots lawyers, and most continental systems of marriage law, define a bastard as a child born of a woman who was not married to the father at the time of conception, and *who was never thereafter married to him*. This includes the case of an invalid marriage, except according to Scots law in the rare case of a putative marriage—i.e. a mistake in good faith on the part of both parents. Although there is, of course, a presumption of legitimacy where a child is born during marriage, that presumption can be removed by evidence to the contrary.

Bastards are incapable of inheriting real property; nor can they claim any share of personal estate as next of kin to a party dying intestate. It has even been decided that a child born before wedlock in a foreign country, according to whose law such child was legitimate, could not inherit land in England; but this rule does not extend to personal property; nor would such a decision be generally accepted as consistent with private international law. Prior to 1834, even in England, if a bastard held possession till his death of his father's land, his descendants could not be ejected by a legitimate son of the bastard's parents who had subsequently intermarried. Such a bastard was called *bastard eigné*.

There can be no collateral succession through bastards; for as they cannot be heirs themselves, so neither can they have any heirs but those of their

own bodies. A bastard is not entitled to the name either of his reputed father or that of his mother, though he may acquire for himself a surname by reputation; nor can he take property under a will by the mere description of *child* of his reputed parent, until he has acquired the reputation of standing in that relation to him. Nor does a bastard follow, as legitimate children do, his father's place of parochial settlement under the poor-laws, but he has and follows the settlement of his mother until he attains the age of 16, or until he acquires a settlement in his own right, and after that age his primary settlement is in the parish where he was born. Another peculiarity of the status of bastardy is, that a bastard being *filius nullius* ('nobody's child'), the consent of his father or mother to his marriage is not required, and is of no avail; but a guardian may be appointed by the Court of Chancery for the purpose, or a license may be granted upon oath made that there is no person authorised to give consent. To this may be added, that although in general a father may by deed or will appoint, in the event of his decease, a guardian for his infant child, he has no such privilege if the child be illegitimate.

In other respects, a bastard is very much in the same position as a legitimate person. Thus, he can hold land in fee-simple, and can dispose of it as he may think proper, and he can make a will bequeathing his whole estate—a privilege which was not conceded to bastards in Scotland dying without lawful issue, till the year 1836. In regard to his personal estate, although the crown is entitled to such in the case of a bastard dying intestate, the royal claim is not strictly enforced; but upon petition, the crown's right will be waived in favour of the bastard's family. In the Scots law also the crown may, by what is called a *gift of bastardy*, grant not only the personal, but also the real estate of an intestate bastard to the 'donatory,' or person similarly entitled, as in the case of personal property in England. Practically the same effect is produced by royal letters of legitimization during the bastard's life. It is also to be observed that the prohibitions as to marriage which extend to collaterals, and to those related by the half-blood only, also apply although one of the parties be a bastard. Again, the laws relative to incest apply to a bastard. A bastard may be made legitimate by an act of parliament for all purposes, even for that of inheriting land, 'as was done,' says Blackstone, 'in the case of John of Gaunt's bastard children by a statute of Richard II.'

In England, the maintenance of an illegitimate child devolves in the first instance on the mother. She is for this purpose entitled to its custody in preference to its father; and she is bound to maintain it as part of her family while she remains unmarried, or until the child attains the age of 16, or gains a settlement in its own right, or (being a female) is married; and in the event of the mother's marriage, the same liability attaches to her husband. If the mother be of sufficient ability to maintain the bastard while he is thus dependent on her, and neglect that duty, so that he becomes chargeable to a parish, she is liable, by 7 and 8 Vict. chap. 101, sect. 6, to be punished under the provisions of the *Vagrant Act*. If the mother is dead or in prison, two justices may appoint a person to take the custody of the child. By the Poor-law Act of 1844, as amended by the Bastardy Acts of 1872 and 1873, the putative father may be summoned and compelled to make a proper allowance, not exceeding five shillings a week, for the support of the child till 16. This is called a Bastardy Order. And under the Summary Jurisdiction Act of 1881, proceedings of this kind may be taken in the local courts, by an English mother in Scotland,

or by a Scottish mother in England, wherever the father is within the local jurisdiction.

The chief points in which the position of a bastard differs in Scotland are, that he is fully legitimated by the subsequent marriage of the parents, and that the mother has the legal custody only until the age of 7 in males and 10 in females. The decree for aliment is given against the father up till these ages, but recently, in consequence of the restrictions placed on employment of children by the Factory, Mines, and Education Acts, the decree has been given up till the age of 10 in the case of boys also. The rate is 2s. 6d. to 3s. per week. At the age of 10, the father would be entitled to take the child from the mother to his house. In Scotland, the father is at common law bound to contribute to the necessary subsistence of the child. Failure to support is punishable under the Poor-law Act.

Both in England and Scotland the widow of a bastard, whether there be issue or not of the marriage, is entitled to dower, terce, *jus relicte*, and all the other legal rights of widows. See AFFILIATION, DIVORCE, HEIR, ILLEGITIMACY, LEGITIMACY, MARRIAGE, SUCCESSION, ULTIMUS HÆRES, VAGRANTS.

In the United States also a bastard is one born of an illicit connection, and before the lawful marriage of its parents; one begotten and born out of lawful wedlock. A man is a bastard if born during coverture under such circumstances as to render it impossible that the mother's husband can be his father; or if born beyond a competent time after the coverture has determined. A bastard has no right of inheritance at common law, and the principal right he has is that of maintenance by his parents. In most states, children born before the marriage of their parents are made legitimate by the subsequent marriage of their parents.

The 'Bastard of Orleans' was the famous soldier Dunois (q.v.). Amongst other illustrious bastards may be named William the Conqueror, the Regent Moray, Don John of Austria, the Duke of Monmouth, the Duke of Berwick, and Marshal Saxe. See FITZ, BATON-SINISTER.

Bastard Bar, a popular but inaccurate name for the Baton-sinister (q.v.) in Heraldry.

Bastardy, DECLARATOR OF. This is a suit which may be instituted in the Court of Session in Scotland, for having it declared that the lands or effects which belonged to the deceased bastard, belong to the donatory in virtue of the gift from the crown. The 'defender,' or person against whom the suit is formally brought, is the party who would have succeeded to the bastard, had he been legitimate. The decree in such an action may be necessary for completing the title to lands which belonged to the bastard.

By an act of parliament in 1858, the same conclusion may be substantially obtained by the English proceeding, directed by the act in the Court for Divorce and Matrimonial Causes. The act in question, it is declared, may be cited for all purposes as the 'Legitimacy Declaration Act, 1858.'

Bastia, the former capital of Corsica, is picturesquely situated on the slope of a mountain, rising from the sea in the form of an amphitheatre, in the north-eastern part of the island, 95 miles NNE. of Ajaccio by rail. Its streets are narrow and crooked, its harbour still somewhat difficult of access, yet it has considerable shipping. Antimony-mining, boat-building, iron-founding, tanning, and coral-fishing are carried on; besides, there is some trade in oil, wine, and fruit. Pop. (1881) 19,696. Bastia was founded in 1383 by the Genoese Leonello Lomellino, and was the seat of the Genoese governors for 400 years. It has several

times been in the hands of the English, who, under Admiral Hood, last captured the town in 1794, after an obstinate and protracted siege. When Corsica was divided into two French departments, it was made the capital of one; but when both were united in 1811, the seat of government was transferred to Ajaccio.

Bastian, ADOLF, German traveller and anthropologist, born at Bremen, 26th June 1828, studied at Berlin, Heidelberg, Prague, Jena, and Würzburg, and in 1851 sailed for Australia as a ship's doctor, thereafter travelling in North and South America, Europe, Asia, Africa, and where not else besides. No equally well-equipped ethnologist has ever travelled so widely, and no single observer has accumulated such a mass of invaluable materials for the history of man. It would be difficult to overestimate the indebtedness of the science of anthropology to the practised eye of one restless traveller. His thirty works record his observations in almost as many countries of the world. The most important are in *Der Mensch in der Geschichte* (3 vols. 1860), *Die Völker des östlichen Asien* (6 vols. 1866-71), *Ethnologische Forschungen* (2 vols. 1871-73), *Schöpfung oder Entstehung* (1875), *Die Vorstellungen von der Seele* (1875), *Vorgeschichte der Ethnologie* (1881), *Zur Naturwissenschaftlichen Behandlung der Psychologie* (1883), *Allgemeine Grundzüge der Ethnologie* (1884), *Religionsphilosophische Probleme* (1884), and *Der Fetisch an der Küste Guineas* (1885). Berlin is his headquarters, and in 1869 he undertook the joint-editorship with Virchow and R. Hartmann of the *Zeitschrift für Ethnologie*.

Bastian, HENRY CHARLTON, physiologist, was born at Truro, Cornwall, in 1837, and from a private school at Falmouth proceeded to University College, London, where he became professor of Pathological Anatomy (1867), hospital physician (1871), and professor of Clinical Medicine (1878). His works include *Modes of Origin of Lowest Organisms* (1871), *Beginnings of Life* (1872), *Evolution* (1874), and *The Brain as an Organ of Mind* (1880), the fullest scientific exposition till then published of the views on the subject of psychology held by the extreme physiological school. Dr Bastian is notable as the champion of the doctrine of spontaneous generation.

Bastiat, FRÉDÉRIC, an eminent political economist, was born at Bayonne in 1801. His father was a merchant, and educated his son with a view to the same calling. In 1818 Bastiat entered the commercial house of one of his uncles at Bayonne, and employed his leisure hours in the study of political economy. In 1825 he withdrew from the business, and gave his time to study, especially of economics, extending his knowledge afterwards by travels in Spain and England. Circumstances led him to examine the movement in England for the repeal of the Corn Laws. His first appearance as an author was in 1844, when he published in the *Journal des Economistes* an article on the influence of French and English tariffs on the future of the two peoples. It contained in germ his theory of political economy, and Bastiat from that time was a decided opponent of the system of protection. In 1845 he published a work entitled *Cobden et la Ligue, ou l'Agitation Anglaise pour la Liberté du Commerce*, containing the speeches of the English free-traders. In 1846 he settled in Paris, and devoted his energies to the cause of free-trade. He became secretary of the societies, and chief-editor of the journal established to vindicate its principles; and published his *Sophismes économiques*, in which he attacked the protective system with great wit and controversial acumen. After the revolution of 1848, he was

elected successively a member of the Constituent and Legislative Assemblies. From this time till his death, his strength was applied chiefly to controverting the socialism which became so prominent during the revolution. Suffering from pulmonary disease, he repaired to Italy for change of climate, but died at Rome on the 24th December 1850.

Besides the writings mentioned, Bastiat published *Propriété et Loi, Justice et Fraternité—Protectionisme et Communisme, Harmonies économiques*, and several other important tractates, all of which exhibit extensive knowledge of the subjects discussed, vigorous logic, and a power of sprightly and biting satire (new ed. of his works, 7 vols. Paris, 1881). The *Sophismes* and the *Harmonies économiques* have been translated into English by P. J. Stirling.

Bastide, JULES, a French journalist and politician, Minister of Foreign Affairs in 1848, and member of the Constituent Assembly, was born at Paris in 1800. Bastide was early conspicuous among the radical writers of Paris. Holding a command in the National Guard, he took part in an insurrectionary movement in June 1832, and was condemned to death, but escaped to London. Pardoned in 1834, he returned to Paris, and again devoted himself to politics in the columns of the *National*, and in 1847 he founded the *Revue Nationale*. During the revolution of 1848, he was a supporter of General Cavaignac and an opponent of socialism. In 1858 he published *La République Française et l'Italie en 1848*; and in 1859, *Guerres de Religion en France*. He died March 3, 1879.

Bastien-Lepage, JULES, French painter, born at Damvilliers, November 1, 1848, studied under Cabanel, and early began to attract notice by his impressionist, but strong and real pictures in the Salon. Some of his more important works were 'In Spring,' 'The First Communion,' 'The Shepherds,' 'The Wheat-field,' 'The Beggar,' and 'Joan of Arc listening to the Voices.' Striking portraits were those of his grandfather, his father and mother, Sarah Bernhardt, André Theuriet, and the Prince of Wales. The painter died of a painful and lingering disease at the height of his fame, December 10, 1884.

Bastille was, in France, a general term for a strong fortress, defended by towers or Bastions (q.v.), and in this sense it was used in England also after the Norman Conquest. The famous prison to which the name was latterly appropriated, was built by order of Charles V., between 1370 and 1383, by Hugo Aubriot, Prévôt or Provost of Paris, at the Porte St Antoine, as a defence against the English. From the first, however, it was used as a state-prison, Aubriot himself being confined there on suspicion of heresy. During the 16th and 17th centuries it was greatly extended and provided with strong bulwarks. On each of its longer sides the Bastille had four towers, of five stories each, over which there ran a gallery, which was armed with cannon. It was partly in these towers, and partly in underground dungeons, that the prisoners were situated. The unfortunate inmates of these abodes were so effectually removed from the world without as often to be entirely forgotten, and in some cases it was found impossible to discover either who they were or what was the cause of their incarceration. The Bastille was capable of containing 70 to 80 prisoners, a number frequently reached during the reigns of Louis XIV. and Louis XV. These prisoners were seldom criminals; they were victims rather of political despotism, court intrigue, ecclesiastical tyranny, or family quarrels, and were lodged here in

virtue of *Lettres de Cachet* (q.v.)—noblemen, authors, savants, priests, and publishers. At the beginning of the French Revolution on the 14th of July 1789, the fortress was surrounded by an armed mob eager to destroy the stronghold of tyranny. The garrison consisted of 42 pensioners and 32 Swiss. The negotiations which were entered into with the governor led to no other result than the removal of the cannon pointed on the Faubourg St Antoine, which by no means contented the exasperated multitude. Some cut the chains of the first drawbridge, and a contest took place, in which one of the besieged and 150 of the people were killed or severely wounded; but the arrival, with four field-pieces, of a portion of the troops which had already joined the people turned the fortune of the conflict in favour of the besiegers. Delaunay, the governor—who had been hindered by one of his officers from blowing the fortress into the air—permitted the second drawbridge to be lowered, and the people rushed in, killing Delaunay himself and several of his officers. The destruction of the Bastille commenced on the following day, amid the thunder of cannon and the pealing of the *Te Deum*. The event in itself was apparently of no great moment, leading only to the release of three unknown prisoners—one of whom had been there for thirty years—and of four forgers. In that event only the 654 persons whose names now appear on the column in

The Bastille.

the Place de la Bastille took part, yet it finally broke the spirit of the court-party, and changed the current of events in France. The Bastille had long been regarded as the stronghold and symbol of tyranny, and its destruction was everywhere hailed as the downfall of an evil system. 'But,' said the king when the news was brought him, 'that is a revolt.' 'Sire,' said De Liancourt, 'it is not a revolt—it is a revolution.' See Carlyle's *French Revolution*, and the Hon. Captain Bingham's *Bastille* (2 vols. 1888).

Bastinado (from Fr. *baston* or *bâton*, 'a cudgel'), the name given by Europeans to the punishment in use over the whole East, which consists in blows with a stick, generally upon the soles of the feet, but sometimes upon the back.

Bastion, part of a system of Fortification invented by the Italian engineers about the middle of the 16th century, and generally used until the introduction of the present polygonal system by the Germans at the beginning of this century. A fortified town is usually surrounded by a deep ditch with masonry sides, behind which is the rampart forming a polygon of many sides. It is important to flank this

ditch so as to prevent the enemy collecting in it, and this is done either, as in modern fortresses, by constructing a projecting work in front of the centre of each face of the polygon, or, as formerly, by making bastions at each of its salient angles. The plan of one *front*—i.e. two bastions and the *curtain* or wall connecting them, is given below, with the names of the different lines forming the *trace*. The distance between the

B, bastion; C, curtain; D, flank; E, face; F, salient; G, shoulder; H, gorge.

bastions varies from 200 to 600 yards; a greater distance would make the fire from the flank dangerous for the defenders of the face flanked. The main part of a bastion is the rampart, an immense mound of earth, faced with brick or stone, capable of supporting heavy guns, and of receiving the fire of the enemy. A *hollow* bastion has the space behind the rampart kept down to the level of the natural ground; a *solid* bastion is filled up to the level of the rampart. Vauban devised the plan of having large *detached* bastions opposite the chief angles of the place, with a ditch behind each; a tower or small bastion being placed at the real angle of the wall behind. See FORTIFICATION, SIEGE.

Basutos are a South African race belonging to the great Bantu stock, and closely allied to the Bechuanaas, if not really a subdivision of the latter people. Their country lies between the Orange River Free State and Natal, and is hilly and well watered. The Bantu stock, as distinguished from negroes on the one hand and Hottentots and Bushmen on the other, is that to which the Kaffirs also belong. The Basutos are superior to the Kaffirs in intelligence and industry, but rank below them in bodily development and warlike energy. They have played an important part in South African history for the last fifty years. They originated politically about the beginning of the century, made up from various races of Bechuanaas and Kaffirs, united under Motlume. To him succeeded about 1828 the famous Moshesh, who did much for his people, and maintained from his impregnable rock-fastness, Thaba-Bosigo, a forty years' warfare against both Boers and English. At last, continual fighting so weakened his followers that the English were able in 1868 to add his territory to their possessions. For some years Basutoland formed a part of Cape Colony, but further troubles arose, and the attempt at disarmament in 1878 led to a revolt of almost the whole tribe. Strenuous efforts were made by the colony to put down the rebellion, with but little success. The Basuto chiefs were anxious to be under the direct authority of the imperial government, and the failure of their negotiations disposed the authorities at the Cape to offer no opposition to their demand. A great *Pitso* of the Basutos, held November 29, 1883, attended by the representatives of more than two-thirds of the whole tribe, unanimously expressed a desire for British rule, and a willingness to pay the hut-tax, which was a condition of the imperial government. Accordingly, Basutoland became an appanage of the British crown from March 13, 1884.

Basyle is the name given by Graham, the eminent chemist, to a simple or compound sub-

stance which can unite with oxygen to produce a Base (q.v.). Thus, all the metals are examples of simple basyles, and ammonium, NH_4 , ethyl, C_2H_5 , methyl, CH_3 , &c. represent compound basyles. In recent years the term has fallen into disuse, radicals or compound radicals being used instead to designate the compound basyles.

Bat. Bats form an order of mammals in which the fore-limb is modified for flight. To this fact their technical name Chiroptera (Gr., 'hand-winged') refers. The order includes a large number of widely distributed forms, and most people are familiar with the swift and curious flight of some of the common species which hunt for food in the twilight.

History.—Aristotle is often libelled by being accused of regarding these mammals as birds; but he was quite incapable of such a crude mistake. His successors were not, however, and many naturalists down to a couple of centuries ago were content to accept the popular appreciation of these animals as 'unclean fowls,' or to regard them as altogether hopeless puzzles. In 1683 John Ray referred them, with his usual clearness, to the class Mammalia; and Linnaeus in 1748 gave them an honourable position along with man and monkeys in the highest mammalian order of Primates. Though often regarded as birds by those who are careless of zoological system, such popular names as Flitter-mouse (Ger. *Fledermaus*) indicate some appreciation of their true position. They are now most accurately described as a special order of much modified Insectivora.

General Characters.—Since bats are Insectivora modified for aerial locomotion, the most striking general character concerns the structures used in flight. A true wing is present, and consists of a skin-expansion spread out between the four fingers, and extending to the sides and to the hind-legs. An accessory membrane extends from the tail to the hind-legs. The fore-legs are much better developed than the hind pair—a marked exception to the general rule. The strong shoulder-girdle, the capacious chest, the very hollow bones of the limbs, the keel on the breast-bone, the position of the teats on the breast, the simple uterus and generally single birth, and many other general characters, are to be interpreted as adaptation associated with the flying habits of these mammals. The discoidal deciduate placenta, the comparatively low brain with uncovered cerebellum, and other features are shared with the Insectivora, and point to the origin of the bats from that group.

Classification and Distribution.—Two natural sub-orders may be distinguished—I. *Megachiroptera*, fruit-eating forms—generally large, with smooth crowns on the longitudinally grooved grinders, usually with a claw on the third joint of the first finger, inhabiting the warm parts of the eastern hemisphere; II. *Microchiroptera*, mostly insect-eating forms—generally small, with sharp insect-crunching tubercles on the transversely grooved grinders, with a usually single-jointed, never clawed, first finger, inhabiting the tropical and temperate regions of both hemispheres. (1) The frugivorous large bats form the family Pteropodidae, including the African *Epomophorus*, the 'flying fox' *Pteropus*, most abundant in the Malayan and Australian regions, but never occurring in Africa, the *Cynonycteris* of the Egyptian pyramids, the very common Indian bat *Cynopterus*, and other genera. (2) The smaller insect-eating bats form much the larger sub-order. They comprise five families: (a) the Vespertilionidae, including the common *Pipistrelle* and other *Vesperugo* species, the abundant North American *Nycticejus*, &c.; (b) the family *Nycteridae*, such as the large

Queensland form (*Megaderma gigas*) (fig. 3), the common Indian species (*M. lyra*), and the very peculiar genus *Nycteris* of the Ethiopian region;

Fig. 1.—The Greater Horseshoe Bat (*Rhinolophus ferrum-equinum*), flying.

(c) the family *Rhinolophidae*, very highly developed bats, with complicated sensory nasal appendages—e.g. *Rhinolophus* and *Phyllorhina*; (d) the family *Emballonuridae*, cosmopolitan forms with obliquely truncated snouts—e.g. *Emballonura*, *Noctilio*, *Molossus*, the New Zealand *Mystacina*, &c.; and (e) the family *Phyllostomidae*, inhabiting Central and South America, and often characterised by nasal appendages, including the remarkable *Mormops*, the Vampire genus, the blood-sucking *Desmodus*, &c.—The known fossil forms, going back apparently to the Upper Eocene, are all highly specialised, so that the Chiroptera must have diverged from the Insectivora at a very early date.

Structure.—The membranes of flight, the short hind-legs, the capacious chest, the frequent presence of nose-leaves, have already been noticed as external features which at once catch the eye. Some of the characteristic structures must be noted, however, at greater length: (a) *Skin*—The skin is more highly developed in bats than in any other order of mammals. On the one hand it is modified to form the flying fold, extending (1) from the shoulder along the upper arm to the thumb; (2) between the four fingers, and thence onwards to the legs; (3) between the back of the legs and the posterior extremity of the body. On the other hand the skin comes into close association with the sensory function of touch which bats are well known to possess in such a remarkable degree. Spallanzani showed that bats deprived of sight, hearing, and smell, could in a marvellous way fly about a room without colliding with numerous threads hung across it; they could fly through crooked passages, and detect the approach of a hand and the like. Fine nerve-filaments are spread out on the skin of various regions, such as the sides of the muzzle, the outer ear, the nose-plaits, the wing-membrane, &c. The margins of the nostrils and glandular eminences on the sides of the snout are in many forms developed into curious, much folded, leaf-like appendages, kept soft by the secretion of numerous oil and sweat glands, and rendered sensitive by the abundant distribution of nerve-endings. In some cases attaching suckers are developed near the thumbs. Scent glands and bags are frequently present as secondary sexual characters. (b) *The skeleton*—Three types of true wing occur among vertebrates. In the extinct Saurian *Pterodactyls* (q.v.) the skin forming the wing was mainly stretched on the greatly elongated little finger. In the wing of birds the digits are greatly reduced and modified. In bats, the

bones of the palm (metacarpals) and joints of the four fingers are greatly elongated to serve as supports to the greater part of the membrane of flight. The clawed thumb is not included in

uterus, is discoidal and deciduate (see PLACENTA), and the two mammary glands are situated on the chest or under the armpits.

Habits.—Almost all the bats are nocturnal, and sleep during the day hitched up by their hind-legs, with their wings drawn over them. They come out in the twilight to hunt for food, and then their shrill squeak may not unfrequently be heard. The proverbial simile 'as blind as a bat,' must refer to their dazzled behaviour during the day, for they can see exceedingly well with their sharp eyes. Even apart from eyes they are able to steer their way adroitly, as the experiments of Abbé Spallanzani and others have shown. What Cuvier demonstrated in regard to the abundant distribution of nerves on various parts of the body is now known to be the correct explanation of their marvellous sensitiveness. It is also interesting to notice that the circulation of blood in the wings is so active as to amount almost to an inflammation—a suggestive fact in connection with their tender sense

Fig. 2.—Skeleton of *Phyllostoma hastatum* :

a, clavicle; b, humerus; c, radius; d, ulna; e, carpus; f, thumb; f', finger; g, femur; h, tibia.

of touch. Bats hibernate in winter, and are found in caves, barns, belfries, forests, &c. in large numbers. A minority feed on fruits, but most are insect-eaters, while a few (not including the vampire) suck the blood of small, and occasionally even of large mammals. The males and females often live apart.

Important Forms.—Among the large fruit-eating bats, the Flying Foxes (*Pteropus*); the Great Kalong (*Pteropus edulis*), the largest of the bats (14 inches long); the fig-eating South African *Epomophorus*; and the destructive Indian Fruit-bat (*Cynopterus marginatus*) may be mentioned as representative. Some of these do great damage to fruits of various kinds. Among the smaller insectivorous forms, the Vespertilio alliance includes the Horseshoe Bats, of which two species (*Rhinolophus ferrum-equinum* (fig. 1) and *R. hipposideros*) occur in Britain; the Lyre Bat (*Megaderma lyra*), often called vampires in India, and said sometimes to eat smaller bats, frogs, fish, &c.; the Desert Bat (*Nycteris thebaica*), which inflates its skin with air so as to form a balloon; the common Long-eared Bat (*Plecotus auritus*), often in church towers; the

Fig. 3.—*Megaderma gigas*, sleeping.

been already noticed. The testes are on the abdomen or on the groin. The placenta by which the young bat—generally only one—is attached to the wall of the simple or horned

(c) **Other structures**—The alimentary canal varies with the nature of food, being simpler and shorter in the insect-eating smaller bats. An exceptional type is exhibited by the blood-sucking *Desmodus*, where the blood is probably stored up in a long blind process from the stomach region. The brain is of a low type, but the tactile sensitiveness of the bats exceeds that of any other order. How the lips, nostrils, external ears, &c.

come to be delicate organs of touch has

Fig. 4.—*Barbastelle*, walking.

Barbastelle (*Synotis barbastellus*); the Noctule (*Vesperugo noctula*), the Pipistrelle (*V. pipistrella*), and two other species of *Vesperugo* occurring along with the four last-named bats in Britain; one of the two New Zealand bats (*Chalinolobus tuberculatus*); the Whiskered Bat (*Vespertilio mystacinus*), common in Europe, and also recorded in England. The thick-legged bats, or Emballonuridæ, are represented by such forms as the Mountain Bat (*Emballonura monticola*), living

a social life on the solitary mountains of the Eastern Archipelago; the Tomb Bat of Egypt (*Taphozous perforatus*); the curious Egyptian Rhinopome (*Rhinopoma microphyllum*), abundant in the darkness of the Pyramids; the very ugly Collared Bats

Fig. 5.—Heads of (A) *Epomophorus gambianus*, (B) *Pteropus rodericensis*.

with folded skin (*Chiromeles torquatus*); the short-tailed New Zealand Bat (*Mystacina tuberculata*), which is fonder of walking than most of its kind. This species of bat, and the *Chalinolobus* noted above, 'represent the whole indigenous mammalian fauna of New Zealand.' The 'vampires,' or

Fig. 6.—Heads of (C) *Phyllorhina tridens*, (D) *Chiromeles torquatus* (female), (E) *Trachyops cirrhosus*, (F) *Chaeronycteris mexicana*.

Phyllostomidae, include a number of blood-sucking forms, but the chief guilt in this connection must be laid to the charge of *Desmodus*, which sometimes attacks mammals of considerable size, and even man. The Vampire Bat itself (*Vampyrus spectrum*) must be acquitted.

Bats form an order of great interest and importance to the naturalist. From a practical point of view they are of some importance so far as the one set destroy fruit-crops, and the others make up for this by destroying insects, while only a very few are somewhat more sanguinary. See MAMMALIA,

FLYING FOX, VAMPIRE; also Professor Flower's article 'Mammalia' (*Encyclo. Brit.* 9th ed.); G. E. Dobson's *Catalogue of Chiroptera in British Museum* (1878); and the same naturalist's *Monograph of Asiatic Chiroptera*.

Batangas, a seaport town of the Philippines, the capital of a province in the south-west of the island of Luzon, 50 miles S. of Manila. It was founded in 1581, and is well built, lying on an extensive bay which opens into the Strait of Mindoro. Pop. of town and district, 27,000; of province, 275,075.

Batatas. See SWEET POTATO.

Bat'avi, an old Teutonic people who inhabited a part of the present Holland, particularly the island named from them *Insula Batavorum* (modern *Betuwe*), which is formed by the branch of the Rhine that falls into the sea near Leyden, by the Waal, and the Meuse. Their country extended southward across the Waal. Under Augustus they became allies of the Romans, and earned for their fidelity the honourable title of friends and brothers of the Roman people, and were permitted to choose their commanders from amongst themselves. Their cavalry were famous, and were often employed by the Romans.

Bata'via, properly the name of the island occupied by the ancient Batavi, became at a later date the Latin name for Holland and the whole kingdom of the Netherlands. The name Batavian Republic was given to the Netherlands on their new organisation of 16th May 1795, and they continued to bear it till they were converted into the kingdom of Holland, under Louis Bonaparte, 8th June 1806.

Bata'via, the capital of the Dutch East Indian possessions, stands on the NW. coast of Java, near the mouth of the Tjiliwong, frequently called the Jaccatra, from the former native town, on the ruins of which the present city was built. The river, which is small and shallow, is connected with a network of canals which intersect the town. The influence of a vertical sun on the canals of this Holland in miniature made Batavia become proverbial as the grave of Europeans. The temperature, though not extreme, is oppressive from its uniformity, the mean of winter being 78.1° F., and that of summer only 78.6°. Latterly, however, the climate has been greatly improved by draining, and most of the merchants live in the healthier suburbs, which occupy higher ground farther inland, the principal being Weltevreden ('well-content'), Molenvliet, Rijswijk, Noordwijk, and Koningsplein. In some of these suburbs, which form the new town, the houses stand in spacious gardens with trees around them. The old town was formerly surrounded with walls and fortifications, and till 1808 was not merely government headquarters, but the main centre of population. But in that year the walls, useless since the complete subjugation of Java, were demolished, and the seat of government was transferred from the town on the swampy and unhealthy low grounds to Weltevreden, 2½ miles farther inland. Now the old town contains mainly shops, stores, offices, and the houses of natives and Chinese. During the day, however, it is a busy place; and in it are still the town-house, the exchange, the great poorhouse, a hospital, &c. The bay is spacious, but very shallow towards the shore, and is yearly becoming shallower. Batavia is accessible only to boats; and since 1880 the government has constructed a great harbour some distance to the eastward at Tanjong Priong, connected with the capital by road, rail, and canal. To seaward the bay is protected by a range of islands and sandbanks; and it therefore affords a very secure anchorage. Notwithstanding the

growing prosperity of Singapore, Batavia continues to be the commercial emporium of the far East. Its markets present at once all the productions of Asia and all the manufactures of Europe. There is frequent communication by steam with Singapore, all the Dutch East Indies, and Australia. The chief exports are coffee, rice, indigo, hides, arrack, sugar, palm-oil, cajuput-oil, tin, pepper, teak, buffalo horns and hides, tea, cassia, sapan wood, tortoise-shell, and tamarinds. The imports comprise cottons, woollens, silks, machinery, iron goods, wine, butter, articles of luxury, and ice (from America). The duties, formerly very high, have been reduced since 1866. The total value of exports is reckoned at £1,500,000; of the imports, £2,000,000. About half of the total trade is with Holland. Batavia possesses, besides the citadel and government offices, a society for the arts and sciences, founded 1778; a society for the study of Eastern geography, ethnography, and languages; a national history society, a chamber of commerce, an agricultural society, a gymnasium, a medical school, and various other educational and learned institutions. In 1811, while Holland was under France, Batavia was taken by the English, but was restored to its former owners in 1816. The Dutch government has laid a telegraphic cable of 600 miles from Batavia to Singapore. There is a railway from Batavia to Buitenzorg and other points in the interior. Pop. (1885) 92,193, of whom 6000 are Europeans—Dutch, Portuguese, and half-breeds; 65,000 Chinese; 1500 Moors and Arabs; besides Javanese and Malays.

The province of Batavia is low, but rises gently towards the south. Pop. nearly a million, of whom 8000 are Europeans, 70,000 Chinese, and the remainder mostly natives. The religion is chiefly Mohammedan. See JAVA.

Batavia, a post-village of Western New York, on Tonawanda Creek, 36 miles NE. of Buffalo by rail. It has several mills, and manufactures of sashes and blinds, ploughs, and farming-implements, and is the seat of the state institution for the blind (1868). Pop. (1880) 4845; (1890) 7200.

Batchian. See MOLUCCAS.

Bates, HENRY WALTER, F.R.S., naturalist and traveller, was born at Leicester, 8th February 1825. During his apprenticeship to a manufacturing hosiery, he formed a friendship, due to kindred love of natural history, with Mr Alfred R. Wallace, then master in the Collegiate School. In April 1848 the two left to explore the Amazons, where Bates remained till June 1859. In 1861 he published his distinctive contribution to the theory of natural selection in a paper explaining the phenomena of Mimicry (q.v.). The narrative of his travels, *The Naturalist on the Amazons*, which at once took high rank, appeared in 1863. In 1864 he was appointed assistant-secretary of the Royal Geographical Society, which post he filled till his death, 16th February 1892. Bates was pre-eminently a philosophical naturalist, his special study, that of beetles, being mainly for the light which that vast order throws on the theory of descent.

See the Obituary in *Proc. Roy. Geog. Soc.*, April 1862; *The Naturalist on the Amazons* (reprint of 1st edition, with memoir by Edward Clodd, 1892).

Bath, the chief city of Somersetshire, is beautifully situated in the wooded valley of the sinuous Avon, 11½ miles ESE. of Bristol, and 107 W. of London. Its houses are built wholly of white freestone—'Bath oolite,' worked in the neighbouring quarries—brick being entirely discarded (see BATH-STONE). Set in a natural amphitheatre, with Lansdown Hill (813 feet) to the north, the city has a finer appearance than any other in England, the variety of level giving very

commanding sites for its fine and regular streets, crescents, circus, and public buildings. The beauty and sheltered character of its situation, the mildness of its climate, and especially the curative efficacy of its hot chalybeate springs, have long rendered Bath a favourite fashionable resort. The springs, which supply several baths, were known to the Romans, who here in the 1st century A.D. built baths, of which extensive remains were discovered in 1755 and again in 1881. A large portion of these has been uncovered, including an oblong bath 83 feet in length by 30 in breadth, and a circular bath 25 feet in diameter. The temperature of the springs varies from 97° to 120° F.; they rise near the river-bank, in the centre of the city, and discharge about 185,000 gallons of water daily. The water is most useful in bilious, nervous, and scrofulous complaints, palsy, rheumatism, gout, and cutaneous diseases. Though the gaiety of Bath has greatly waned since the days of Beau Nash (q.v.), there has been a great general improvement in the city. It has a beautiful park (1830), and many open spaces; a theatre, concert-rooms, and other places of amusement; the literary and scientific institution, museum, club-houses, good hotels, &c. Noteworthy edifices are the Assembly Rooms (1771), the Guild-hall (1766), the Pump-room (1797), the Mineral Water Hospital (1737-1861), the City Markets (reconstructed 1863), and the new baths (1887). The Abbey Church (1499-1616) is a cruciform Late Perpendicular structure, with a fine fan-tracery ceiling in the style of Henry VII.'s chapel, and a central tower 162 feet high. In 1864 and subsequent years the interior was thoroughly restored by Sir G. G. Scott at a cost of £30,000. Of numerous other churches the finest is the Roman Catholic Priory Church (1863), with a spire 200 feet high. On Lansdown Hill is Beckford's Tower, 130 feet high, built by the eccentric author of *Vathek*. South of the city is Prior Park, built in 1743 by Ralph Allen, Fielding's friend, and now a Catholic college. There are several other educational establishments—the Bath College, the Royal School for Officers' Daughters, the Wesleyan College, &c. Bath returns two members to parliament, and conjointly with Wells is the seat of a diocese. It has no manufactures of importance; but it has given name to a kind of bun, to wheeled invalid chairs, and to bricks used for cleaning metal. Coal is found in the neighbourhood. Pop. (1881) 51,814; (1891) 51,843. Traditionally founded by a British prince, Bladud (863 B.C.), Bath is really of great antiquity. It was a Roman station called *Aque Solis*, at the intersection of the great Roman ways from London to Wales, and from Lincoln to the south coast of England. The site of the Roman forum is known; and remains have from time to time been discovered of temples, altars, and pavements. Richard I. granted Bath its earliest extant charter, which was subsequently confirmed by Henry III., and greatly extended by George III. Bath figures frequently in literature, in the works of Smollett, Fielding, Anstey, Madame D'Arblay, Miss Austen, Dickens, &c.

See Warner's *History of Bath* (1893); Scarth's *Aque Solis* (1864); Sir G. Jackson's *Archives of Bath* (2 vols. 1873); and Peach's *Bath, Old and New* (1888).

Bath, a city and port of entry, capital of Sagadahoc county, Maine, U.S. It is situated on the west bank of the Kennebec River, 35 miles S. of Augusta. Shipbuilding is the chief industry, in which it takes high rank amongst American cities. It is an important commercial centre, and owns much shipping, as its river possesses good anchorage and docks, and the harbour never freezes over. Bath was incorporated as a town in 1780, and as a city in 1850. Pop. (1870) 7371; (1880) 7874; (1890) 8723.

Bath, BATHING. As usually understood, bathing is the application of water in some form to the body, as in ordinary cold baths, hot baths, or sea-bathing. But many other substances, liquid, solid, or gaseous, may be substituted for water—e.g. mud, seaweed, air; and the baths take different names according to the nature of the substance, its condition, its method of application, or the part of the body to which it is applied—e.g. salt-water bath, hot salt-water bath, salt-water spray-bath, salt-water arm-bath. It may be presumed that at first bathing in cold or in hot water was simply a cleansing or cooling act; then it would develop into a therapeutic process, as a remover of stiffness, pains, and fatigue, and as a preventive or cure for the skin diseases so prevalent in the East; and so it would ultimately become with some peoples a religious and solemn rite. The great step of substituting hot air for hot water in the first stage of the bath took place probably in Phœnicia, that cradle of so many arts, as cinders and other signs of the existence of such baths have been found in the ruins of Baalbek ('the house of Baal'). Thence to Greece was an easy transition, and we know there were many both public and private baths there, the former connected with the gymnasium; while there is also evidence that there were separate institutions for women. Homer tells us that Athena instructed Hercules how to use certain baths, so as to recover his strength after severe exertions, and also that Andromache prepared a hot bath for her husband Hector on his return from battle. The Romans, when they subjugated the Greeks, acquired the bath along with other fruits of their conquest, and carried it to such a pitch of splendour and luxury as it has never since equalled. There were no fewer than 850 baths in Rome at one time, and some of these accommodated thousands of bathers. It will give some idea of their extent and magnificence to quote from Fergusson's *Handbook of Architecture* the following: 'St George's Hall at Liverpool is the most exact copy in modern times of a part of Caracalla's baths.' The bath became such an institution with the Romans, that apparently they could not live without them, and wherever we find Roman remains, we find traces of a bath as well. Thus their use spread throughout Europe, Asia, and Africa, and there is very little doubt that the first Turkish baths were really built by the Romans, and were retained in use through the subsequent centuries on account of their suitability to the climate and to the manners of the people; while in the more northern climes they ceased to be of public importance, until their reintroduction in modern times under the name of Turkish baths. It is unnecessary to enter into a minute description of the Roman bath, as it so closely resembled its modern offspring the Turkish, which will presently be described. The chief points of difference are that the lubricating of the body with oil in the apodyterium, and the practising of various exercises and games in the hall called the sphæristerium, have been omitted in the modern baths.

Hot-air Bath.—(1) In the form generally known as the Turkish bath, there are usually two rooms filled with air heated by stoves placed either inside or outside the rooms. One of these, the tepidarium, has a temperature of about 120° F., while the other, the calidarium, or sudatorium, runs up as high as 220° F. or even higher. In these the bather, with only a cotton loin-cloth and slippers to protect his feet, reclines on marble benches covered with felt, or canvas-covered chairs, until the perspiration runs from every pore. He then passes into the lavacrum, where on a marble slab he undergoes the process of shampooing, the bathman kneading, rubbing, and

thumping every part of his body, until all the loosened epidermis or outer skin, which has been softened by the hot air and perspiration, is removed. He is then soaped over and sprayed or douched with warm water, which is gradually cooled down till it runs perfectly cold, after which he plunges through a cold bath and enters the frigidarium, where he lies comfortably on a couch with a soft dry sheet round him, and reposes for half an hour or longer, sipping a cup of coffee, before dressing to emerge into the outer world again. During this period of repose the bather enjoys a singularly delicious sensation of perfect well-being.

(2) In another form of this bath, which can be taken at home, the hot air is produced by a lamp placed under a wooden cushioned chair, on which the bather sits closely enveloped in blankets fastened tightly round his neck. When the perspiration has broken out freely, the blankets are unfastened, and the body bathed with tepid water, after which the bather lies on his bed or a couch, lightly covered, until the skin feels cool and comfortable. In this, as in most of the other baths to be described, there are innumerable small modifications which need not be discussed here.

Vapour-bath.—(1) That commonly known as the Russian bath consists of a room filled with steam, where the bather sits on benches arranged as in an amphitheatre, so as to give different temperatures according to the height above the floor, until he perspires freely; after which, switching with birch-twigs takes the place of shampooing, and then free application of cold water, carried to the length even of rolling in the snow, completes the process.

(2) A simpler form, where, as in the second form of the hot-air bath, the bather's head is kept outside the bath, sitting as he does either in a wooden box with a hole for his neck, or on a chair as in the hot-air bath, but with a basin of boiling water instead of a lamp beneath it. In this basin there are placed one or two red-hot bricks, or a little quicklime is added to produce abundant vapour. A rude variety of vapour-bath, where the bather is placed in a hole or cabin, is practised amongst the Irish, the Finns, and some other nations.

Medicated, Hot-air, Vapour, and Water Baths.—In these baths some foreign material is added, as bran, sulphur, carbonate of soda or potash, mercury, nitro-muriatic acid, mustard, extracts of pine-leaves, eucalyptus, lavender, conium, seaweed (known as ozone-baths), or mud (either spring or sea).

Baths of the natural mineral water are also given at nearly all the spas at home and abroad; but the subject, with the classification of such baths, will be best discussed at MINERAL WATERS, of which, therapeutically, the most valuable are those containing sodium, magnesia, iron, carbonic acid, sulphur, and hydrosulphuric acid. Natural hot-air baths are given by exposure to strong sunshine, which, if only the head is protected, can be well borne by the naked body. In the salt-districts, as at Droitwich, strong brine-baths are administered. In these curious baths the body has to be held down, as its specific gravity is not sufficiently great to allow it to submerge itself. Wrapping the body in the hide of a newly killed animal is known as an animal-bath. Compressed-air Baths are discussed in a separate article. See also HYDROPATHICS.

Electric Bath.—In this bath, while one pole of the battery is connected with the bath, and thence the electricity passes through the water, the other pole is connected with an insulated bar, to be grasped by the patient while lying in the bath, or with a sponge which can be applied locally as desired. A switch arrangement is usually connected with the bath, by which the direction of the current can be

reversed, or by which it can be sent to a coil, so that faradaic electricity can be applied instead of the galvanic variety. Another switch can also be had which will allow of any desired number of cells being brought into the circuit.

Effects of Hot and Cold Baths.—Hydrotherapeutics, or the science of treating disease by bathing, must now have our attention, in order that we may briefly explain the use of these various baths. No valuable curative agency has suffered so much discredit from over-laudation as has water. Its importance as a therapeutic agent is naturally immense, seeing the great importance of the skin, which is not only one of the chief excreting glands of the body, but regulates the heat-producing function of the system (see SKIN, TEMPERATURE OF THE BODY). It is truly marvellous that, be the external temperature below zero or over 100° F., the temperature of the body remains invariably at about 97° F.; and this result is effected by the skin. Hence the importance of maintaining the latter in perfect health, and this is best attained by bathing. As mentioned previously, all the chief baths are founded on the principle of applying heat and some mechanical friction, and then cold. It is thus seen that water is practically merely the vehicle for the application to the body of the great forms of energy, heat, cold, mechanical friction, and electricity, and of various medicinal substances in solution, so that really it is a fiction to call such treatment distinctively the *water-cure*. The effects of the treatment are that the heat and friction open and stimulate the pores of the skin, dilate the small blood-vessels, and excite to their highest action the terminal nerve-fibres, while the effete scales of the epidermis are loosened and removed; and after all this has been effected, cold is applied to check the action and restore these various parts to their normal quiescent condition. Not only are unhealthy skins thus restored to their normal condition, but the effect is transmitted to the body as a whole, which is stimulated to healthy action; and thus we are able to understand how it can be claimed for baths that they produce at first sight apparently opposite effects of reducing corpulence and increasing body weight, their tendency being to bring the body to the normal line, from whichever side it may have previously deviated.

But besides this general tonic effect, bathing can also produce numerous local beneficial results. In inflammations or congestions of various organs, hot water applied either as a bath or continuous douche, or in the form of fomentations, gives great relief; while in many of the same class of cases, cold water in the form of a pack, or pounded ice in a waterproof bag, is equally effectual. The patient's own feeling, and the general rule that *heat* should be preferred in weak constitutions, must be our guides as to which form to employ. In piles, a hot ascending douche, and in various women's diseases, other kinds of douche, are invaluable. Very hot water is a most successful hæmostatic agent. Wounds are often best treated by water applications, and in cases of great laceration, submerging the part in an antiseptic bath is a cleanly and soothing plan for healing. Diseases of the ear, nose, mouth, and throat are often best treated by sprays of either simple or medicated water. Many lesions of the spinal cord are very much relieved by douches, the spinal ice-bag, or the rubbing wet-pack. Cases of insanity, and specially cases of delirium tremens, derive great benefit from the judicious use of baths.

The treatment of fevers by cold baths, especially those cases in which the fever runs very high, is a comparatively new method, and is much esteemed, particularly in Germany. It has cer-

tainly worked wonders in many instances. The cold may be applied by affusion, wet packs, ice-bags, or baths. The last method is probably the safest and most comfortable for the patient. He is placed in a bath of about 97° F., and the water is gradually cooled down to 60° F. or even lower, after which his body is wiped dry and he is replaced in bed, the process being repeated when the temperature rises again. Baths help the elimination of various poisons, such as lead and mercury. The electric bath is useful both as a stimulant to paralysed nerves and muscles, and as a soother of pain in acute cases. In nearly all forms of skin disease, baths, simple or medicated, are highly desirable. A sulphur-bath is a pleasant and more cleanly method of curing itch than the treatment by sulphur-ointment. In this, as in the other cases, it would be out of place here to enter into a discussion as to the precise rules for guidance, which must be looked for by those who desire them in the various and numerous text-books or treatises on these subjects.

The terms *water-bath*, *sand-bath*, and *electro-plating bath* are used in chemistry and the various arts. The first two are contrivances by which vessels can be heated without immediate contact with the fire, an obvious advantage in many cases; while an electro-plating bath is a solution of silver or other metals which will deposit the metal on suitable substances immersed in it.

Hints to Bathers—Sea-bathing.—It may be laid down that a daily bath of some form or other is useful and beneficial to every one; but all persons whose health is not up to the normal standard ought to obtain competent advice as to the variety of bath which will probably suit them best, and as to how and when they ought to take it. Sea-bathing is probably the most bracing and the best form for the robust; but in our climate, except for a very short time of the year, when the weather is exceptionally fine, it is unsafe for the non-robust, and absolutely dangerous for the delicate. For the latter, bathing under cover is much safer, and this generally implies bathing in fresh water. The popular idea that bathing frequently repeated in fresh water is weakening is a complete fallacy, though salt water is probably superior in some respects, except for persons with very irritable skins. Whatever the form of bath chosen may be, it should never be taken immediately after a full meal, but should be indulged in either after a very light refreshment in the morning, or after two or three hours have elapsed since the last meal; the time varying with the character and quantity of the food which has been eaten.

The duration of the bath must vary with the health and feelings of the patient and with the temperature of the water and air at the time. If a warm glow cannot be obtained almost immediately after emerging from a cold fresh or salt water bath, then the bather may be quite sure it has been indulged in too long; while if such a glow cannot be raised at all, or if a certain duskiness of skin be produced, he may be certain cold bathing alone does not suit his constitution. Many delicate persons can only enjoy a cold bath with safety after a previous application of hot air, water, or vapour—hence one of the advantages of the more elaborate baths, such as Turkish and vapour baths. In regard to Swimming (q.v.) it may be pointed out that in this art we have a combination of bathing with a capital form of exercise, which enhances for the young and robust the advantages of the simple bath.

Public Baths.—The usefulness of such institutions is self-evident. In 1846 an Act was passed by parliament to enable borough councils and parish vestries to establish baths and wash-houses, to be

supported by the rates; and the Act of 1878, amended 1880, authorises the establishment of cheap swimming-baths. In such baths it is found almost essential that there should be separate baths for different classes of bathers. Equally essential are good ventilation, proper heating of the water, and means for restoring suspended animation and for rescuing those in danger of drowning. A very simple, handy, and effective apparatus for this last purpose is a long light bamboo rod. Club baths offer facilities only to such as are members of the club.

Bath, ORDER OF THE. The name of this English order of knighthood is derived from the ceremony of bathing, which used anciently to be practised at the inauguration of a knight, as an emblem of the purity henceforth required of him by the laws of chivalry. The order does not seem to be older than the reign of Henry IV., who, at his coronation in 1399, made 46 esquires Knights of the Bath. Knighthood of the Bath was afterwards from time to time conferred on occasion of great national ceremonials. Charles II. made 68 Knights of the Bath at his coronation, but from that time the dignity fell into oblivion till revived by George I. in 1725 as a military order, consisting of the sovereign, a grand-master who should be a prince of the blood, and 36 knights. At the conclusion of the great war, it was thought expedient, with a view to rewarding the merits of many distinguished officers, both military and naval, to extend the limits of the order, which was effected on the 2d January 1815. But the order was still purely military, and it was not till 1847 that it was placed on its present footing by the admission of civil knights, commanders, and companions. In June 1861 it was further enlarged. The following is its present organisation:

First Class.—Knights Grand Cross (G.C.B.); the number not to exceed, for the military section, 50, exclusive of the royal family and foreigners; and for the civil, 25. The knights of the military section must be of or above the rank of major-general in the army or rear-admiral in the navy.

Second Class.—Knights Commanders (K.C.B.); military, 102, and civil, 50, exclusive of foreigners. These, like the first, have the title *Sir*, and take precedence of Knights Bachelors. The military knights must be of or above the rank of colonel in the army or captain in the navy.

Third Class.—Companions (C.B.); military, 525, and civil, 200. They take precedence of Esquires, but are not entitled to the distinctive appellation of knighthood. No officer can be nominated to the military division of this class unless his name has been mentioned in the *London Gazette* for distinguished services in action; and the order has never been conferred on an officer below the rank of a major, or commander in the navy. The number of the second and third classes may be increased under special exigencies.

The officers of the order are the Dean (who is the Dean of Westminster), Bath King of Arms, the Registrar and Secretary, and the Gentleman Usher of the Scarlet Rod. On the revival of the order in 1725, Henry VII.'s chapel at Westminster was made the chapel of the order, where the stall-plates and banners of the knights were placed over their stalls. But since 1815 there has been no installation of a knight, and the stalls do not now afford sufficient accommodation for the increased numbers of the order.

The insignia belonging to the first class are the collar, badge, ribbon, star, mantle, surcoat, under habit, and cap. The collar is of gold, composed of nine imperial crowns and eight roses, thistles, and shamrocks, issuing from a sceptre and ena-

melled of their proper colours, all united together with seventeen knots enamelled white. The badge of a military G.C.B. is a gold Maltese cross enamelled white, each of its eight points terminating

Star, Collar, and Badge, G.C.B. (Military).

in gold balls, and in each of the four angles a lion of England; in the centre, on a ground of white enamel, are the rose, thistle, and shamrock, issuing from a gold sceptre between three gold imperial crowns, within a red circle charged with the motto of the order, *Tria juncta in uno*, and surrounded with two branches of laurel in proper colours, issuing from an escrol of blue enamel, containing, in gold letters, the legend *Ich dien*. The badge of a civil G.C.B. is an oval entirely of gold, the external fillet containing the motto of the order, and encircling the above device of the rose, thistle, shamrock, sceptre, and three crowns. The badge is suspended from the collar on occasions when the latter is worn; at other times it hangs from a broad red ribbon placed across the left shoulder. The star of a military G.C.B. is formed of rays of silver, thereon a gold Maltese cross charged with three imperial crowns, one and two, within a circle of red enamel charged with the motto of the order in gold letters, and surrounded by two branches of laurel issuing from an escrol like that of the badge. That of a civil G.C.B. has the same circle and central device, with rays of silver in the form of a glory issuing from the centre. The mantle is of crimson silk, lined with white silk, with the star embroidered on the left side, and a lace of white silk on the left shoulder. The surcoat is of the same materials as the mantle. The cap is of black velvet, with a plume of white ostrich feathers.

The insignia of the second class are the badge, ribbon, star, mantle, under habit, and cap. The badges, military and civil, are like those of the first class, but smaller, and the ribbon is narrower. The star of the military K.C.B. differs from that of the military G.C.B. in omitting the Maltese cross, and is in form a cross patée. The star of a civil K.C.B. differs from that just described in omitting the branches of laurel and the escrol and its legend. The mantle and cap are nearly similar to those of the G.C.B.

Companions of the Bath have for insignia only the badge, civil or military, as above described, but of still smaller size. It is fixed to a gold swivel with a bar of the width of the ribbon, and fastened to the coat with a gold buckle.

Knights Grand Cross of the Bath are entitled to supporters. Both G.C.B. and K.C.B. place a red

Badge and Star, K.C.B. (Civil).

circle containing the motto of the order outside their arms, with the badge suspended from it, military knights having outside the circle the two branches of laurel, escrol, and legend, as above. Companions attach the ribbon and badge to the lower part of their shield.

Bathgate, a town of Linlithgowshire, 20 miles W. by S. of Edinburgh by rail. Freestone, coal, carboniferous limestone, and bituminous shale have been extensively wrought in the vicinity—the last since 1852. There are also large paraffin and paper works, a distillery, &c. In 1824 the town was constituted a free burgh of barony, in 1865 a police-burgh. Its chief buildings are the corn exchange, the academy, and the new parish church—a Norman edifice of 1884, with a clock-tower 108 feet high. Sir James Simpson was a native. Pop. (1881) 4887.

Bathometer. See SOUNDING.

Bathori, ELISABETH, the niece of Stephan Bathori, king of Poland, and wife of the Hungarian Count Nádasdy, was born in the latter half of the 16th century. Her diabolical cruelty has condemned her memory to eternal infamy. It is said that she used to cause young girls to be put to death in the dungeons of her castle with the utmost cruelty, that she might renew her own youth from time to time by bathing in their warm blood. The details of the monstrous story are probably exaggerated, but it at least shows that she was conceived capable of it. When at length, in 1610, inquiry was made into the appalling rumours, it was discovered that this female fiend had caused to be murdered no fewer than 650 maidens. Her accomplices were burnt; but she was shut up for life in her fortress of Csej, where she died in 1614. See Baring-Gould's *Book of Werewolves* (1865).

Bathos (Gr., 'depth') is a term employed by critics to designate a ludicrous descent from the elevated to the commonplace in writing or speech, or a sinking below the ordinary level of thought in a ridiculous effort to aspire (see CLIMAX). It is of the essence of bathos that he who is guilty of it should be unconscious of his fall, and while grovelling on the earth, should imagine that he is still cleaving the heavens. A good example of bathos is the well-known couplet:

And thou, Dalhousie, thou great god of war,
Lieutenant-general to the Earl of Mar!

or the well-known encomium of the celebrated Boyle: 'Robert Boyle was a great man, a very great man; he was father of chemistry and brother to the Earl of Cork.'

Bath-stone, a building-stone extensively used in England on account of its beauty, is obtained from quarries in the Lower Oolite, in Wiltshire and Somersetshire. It is fine grained, of a rich cream

colour, and is composed of about 94½ per cent. of carbonate of lime, and 2½ per cent. of carbonate of magnesium, but is free from silica. It is easily wrought in the quarry, some beds cutting almost as readily as chalk, and hardens on exposure to the air, but is not very durable. Within twenty-five years after the repaving of Henry VII.'s chapel in Westminster Abbey, with this stone, it had begun to decompose.

Bathurst, a name applied to various localities in honour of Earl Bathurst, Colonial Secretary (1812-28).—(1) BATHURST in New South Wales, the first county settled beyond the Blue Mountains (q.v.), which were long believed to be impassable. It was not before 1813 that a practical route was formed. Bathurst was still further distinguished as the seat of gold-fields, discovered in 1851. The county is bounded on the NE. by the Macquarie, and on the SW. by the Lachlan; it is well watered, and has a moderate temperature. The whole district is admirably suited for pastoral pursuits. Besides the gold-fields, slate-quarries and copper-mines are also worked, while silver mining has become the leading industry. The chief town, Bathurst, on the Macquarie River, 144 miles W. of Sydney, is now the third in New South Wales, and is a handsome city with numerous elegant public buildings. Erected into a municipality in 1862, it is connected with Sydney by rail, and is well supplied with churches and schools. Bathurst contains a government railway workshop, and has breweries, tanneries, flour-mills; soap, candles, glue, and boots and shoes are also largely manufactured. It is the seat of an Anglican and of a Roman Catholic bishop. Pop. (1881) of city, 7221; of district, 17,391.—(2) BATHURST ISLAND, off North Australia, about 12° S. lat., and 130° E. long. It is included in the northern territory of South Australia, and is close to the much larger Melville Island, and is partly wooded, partly barren.—(3) BATHURST, the principal settlement of the British colony on the Gambia (q.v.). It is situated on St Mary's Isle, a sand-bank at the mouth of the river. The stores of the European merchants face the river, as well as the government house, barracks, and hospital. Pop. about 8000.—(4) An island in the Arctic Ocean, intersected by the 100th meridian, and situated immediately beyond the 75th parallel.—(5) BATHURST INLET, an arm of the Arctic Ocean, projecting due south for about 75 miles into the North American continent, just touching the Arctic circle and 110° west longitude.—(6) A division in the east of Cape Colony, formed from the district of Albany, contains Port Alfred, Bathurst, and other small towns.

Bathurst, EARL, a title conferred in 1762 on ALLEN BATHURST (1684-1775), a Tory statesman, and the friend of Pope, Swift, Congreve, Prior, and Sterne. He had been raised to the peerage forty years before as Baron Bathurst.—His son HENRY (1714-94), second earl, sat for Cirencester from 1735 to 1754, and from 1771 to 1778 was Lord Chancellor—'one of the weakest, though one of the worthiest,' that ever sat on the woolsack.—His son HENRY (1762-1834), third earl, was Secretary for the Colonies from 1812 to 1828. To the same family belonged Henry Bathurst (1744-1837), from 1805 Bishop of Norwich, the 'only Liberal bishop' of his day; and his son Benjamin (1784-1806), who disappeared mysteriously between Berlin and Hamburg, as he was travelling with despatches from Vienna.

Bathybius, the name given to a supposed low form of life found at the bottom of some parts of the deep sea, but usually regarded with much scepticism. In 1857, during the explorations connected with laying the Atlantic cable, attention was first directed to the presence at great depths of

a slimy mass which was first described by Professor Huxley in 1868, and called, in honour of Professor Haeckel, *Bathypus haeckelii*. The supposed organism consisted simply of formless masses of slime without any detectable structure, and containing numerous curious limy concretions. In the same year, Sir Wyville Thomson and Professor W. Carpenter had, in the *Porcupine* expedition, opportunity of examining bathypus in its fresh and apparently living state; and in 1870 Haeckel published a more detailed account of this apparently simplest form of life. His description, like that of Huxley, was wholly based, however, on preserved specimens. Apparently simpler than any of the lowest forms of life (*Monera*) which had been previously discovered, bathypus excited great interest. From the results of the *Porcupine* dredging it was expected that this living slime would be found abundantly diffused in the great depths; but this hope was cruelly disappointed. During the prolonged explorations of the *Challenger* (1872-76) the bathypus was not rediscovered. Nor was this all; for Mr John Murray was led to suspect that what had been regarded as living matter was only a gelatinous precipitate of sulphate of lime from sea-water mixed with alcohol. So strong was his suspicion, that he withdrew his previous opinion as to the existence of any such organism. Huxley regarded this step as justified, and also abandoned bathypus to its fate. This instance of the fallibility of modern scientists has not unnaturally been taken advantage of by opponents, and made the basis of large assumptions as to the general shakiness of scientific conclusions. Haeckel, however, refused to abandon his namesake, and his characteristic constancy of opinion has been to some extent justified by the fact that in a later North Polar Expedition (1876) Dr Bessels discovered a similar quasi-organism, which he named *Proto-Bathypus*. This was dredged in abundance in Smith's Sound from a depth of 92 fathoms, and its appearance and movements seemed to be those of a living organism. It is regarded by some, however, as merely the result of the protoplasmic debris of larger protozoa which sink down to the bottom as they die. The case for or against the existence of such a low form of life is therefore at present doubtful, and must await further exploration. Apart, however, from this special point, it is of more importance to note the fact that the researches of Haeckel, Cienkowski, Zopf, and others, have resulted in our acquaintance with a large number of exceedingly simple organisms, which Haeckel calls *Monera*, and which are only at most a step above bathypus. See LIFE, MONERA, PROTOZOA, PROTOPLASM, SPONTANEOUS GENERATION, &c.

Bathymetry, the art of measuring depths in the sea, especially for the purpose of investigating the vertical range of distribution of plants and animals. An extensive series of such bathymetric measurements was made by H.M.S. *Challenger* (1872-76), the deepest made being at 4575 fathoms.

Batignolles, a northern suburb of Paris.

Batiste, the usual French name for cambric, applied in commerce to a fine texture of linen or cotton. According to Littré, the word is due to the name of the original maker, Baptiste, whose statue still stands at Cambrai; according to others, to its use in wiping the heads of children after baptism.

Batjan. See BATCHIAN.

Batley, a manufacturing town in the West Riding of Yorkshire, 8 miles SW. of Leeds; since 1868 a municipal borough, associated for parliamentary purposes with Dewsbury, 1 mile distant. Batley has about 50 mills and factories, being a

chief seat of the shoddy and heavy woollen manufactures—army cloths, flushings, pilots, druggets, &c. It has a town-hall (1864-74); an old parish church, Perpendicular in style; some 30 other churches; a free grammar-school (1612; reconstituted 1874); a chamber of commerce; a mechanics' institute; waterworks (1871-78); and a market-house. The population has increased rapidly: (1851) 9308; (1871) 20,871; (1881) 27,514.

Batman (Fr. *bât*, 'a pack-saddle'), the soldier-groom of a mounted officer. Every officer in the British army, when doing duty with his regiment, is allowed to employ a soldier as body-servant, and if mounted, a second as groom. These men are struck off all ordinary guards and duties, and receive from the officer a small monthly addition to their pay. On the march and on active service they take their places in the ranks.—*Bât* horses are baggage animals—not chargers.

Batn-el-Hajar ('Womb of Rocks'), a stony district of Nubia, stretching along the Nile in the neighbourhood of the third cataract. The Nile, in the upper portion of the district, is often forced by the approaching rocks into a very narrow channel, and its navigation is frequently interrupted by small islands, rocks, and rapids. The granite hills in some parts attain a height of 2000 feet above the river.

Baton is the name of a short staff, presented by the sovereign to each field-marshal, as the symbol of authority. It is also the name of the long staff carried by the drum-major of an infantry regiment. Baton is also the name of the policeman's truncheon, and of the rod wielded by the conductor of an orchestra. (The French *baton* originally meant simply a stick.)

Baton Rouge, a city on the east bank of the Mississippi, 129 miles above New Orleans, from 1847 to 1862, and again since 1880, the capital of the state of Louisiana. It was one of the earliest French settlements, and as far back as 1838 was the seat of a college. Baton Rouge contains a national arsenal and barracks, a military hospital, an asylum for the deaf and dumb, state penitentiary, an elegant state-house, and several churches. The district is very fertile, producing large quantities of cotton, sugar, and maize. Baton Rouge was more than once the scene of important operations during the civil war. It was occupied by Federal troops after the capture of New Orleans, and defended by General Williams, who fell in fighting against the Confederate general Breckinridge, August 5, 1862. Pop. (1870) 6498; (1880) 7197; (1890) 10,478.

Baton-sinister, a well-known heraldic indication of illegitimacy. It is a diminutive of a Bend-sinister (see BEND), one-fourth of its width, and couped at the ends—i.e. not extending to the sides of the shield, so as to resemble a marshal's baton or truncheon laid diagonally over the family arms from sinister to dexter. From the 15th century onwards it has been largely assigned in England to the illegitimate issue of the royal family. Heraldry says that it may be of metal in the case of bastard descendants of royalty, but in other cases should be of colour, even though placed on colour. In the example represented, the arms of the Duke of Grafton (descended from an illegitimate son of Charles II.), the baton-sinister

Baton-sinister.

is composed of six pieces argent and sable. The terms 'Bar-sinister' or 'Bastard Bar' are often erroneously used for Baton-sinister; the former, for instance, is of frequent occurrence in Thackeray's *Esmond*.

Batoum', or **BATUM'**, a town of Russian Transcaucasia, on the eastern shore of the Black Sea, 201 miles W. of Tiflis, and 575 of Baku, by a railway completed in 1883. The Berlin Congress of 1878, in sanctioning the cession of Batoum by Turkey to Russia, stipulated that it should not be made into a naval station, but should remain an essentially commercial port. None the less the Russians have rendered it a second Sebastopol, and in 1886 withdrew its privileges as a free port. The harbour is one of the best on the east coast of the Black Sea. The place has been vastly improved since it changed hands, as to shops, hotels, schools, churches, and even its single mosque, but is still mean in appearance and insanitary in its conditions. The marshy country around it has been drained. Pop. (1892) 8671, mostly Russians. Batoum was founded as Petra by one of Justinian's generals early in the 6th century A.D., and figures as Vati in the middle ages. Ruins of churches and other buildings are found in the neighbourhood.

Batrachia. See AMPHIBIA.

Batrachomyomach'ia ('the War of the Frogs and the Mice'), a Greek mock-heroic poem, erroneously ascribed to Homer, with whose works it has been generally printed. Pigres of Caria, who lived in the times of the Persian wars, was named amongst the ancients as its author. It is a parody on the *Iliad*, in which the military preparations and contests of beasts, with single combats, intervention of the gods, and other Homeric circumstances, are described with much humour. A recent edition is Mitzschke's (Berl. 1874).

Batrachus. See FROG-FISH.

Battshian. See BATCHIAN.

Batta, in the British army in India, is an allowance in addition to the ordinary pay of officers. The pay is fixed; but the batta varies according to the part of the country in which the troops are placed, and also depends on the circumstance of their being in the field or in cantonments. If in the field, or more than 200 miles from the presidential government cities, the officers receive full batta; if in garrison, or in cantonment within that distance, half batta. The word is Indo-Portuguese, as old at least as 1548, and most likely originally derived from the Canarese *bhatta*, 'rice in the husk.'

Battalion, an infantry unit for both tactical and administrative purposes. The war-strength of a British battalion is 1096 of all ranks, or 1000 bayonets. This is found to be the largest number of men that can be controlled in action by one commander, and has been adopted as the proper strength of a battalion in all European armies. Its front in two-deep line, or in modern attack formation, is 340 yards. A British battalion is divided into eight companies, each commanded by a captain, with two lieutenants under him; the companies are also grouped, for tactical purposes only, into two half-battalions (formerly called wings), each commanded by a major. The whole is under a lieutenant-colonel, who has, as regimental staff, an adjutant (captain or lieutenant), and a quartermaster (captain or lieutenant), who is always promoted from the ranks, a surgeon, and paymaster. The sergeant-major and bandmaster are warrant officers, but do not hold commissions. The other non-commissioned officers are 8 colour-sergeants (1 per company), 32 sergeants, 1 quarter-

master-sergeant, 1 sergeant-instructor of musketry, 1 orderly-room-sergeant, 1 paymaster-sergeant, 1 sergeant-drummer, 1 sergeant-piper (in Highland battalions), 1 armourer-sergeant, 1 sergeant-pioneer, 1 sergeant-cook, and 40 corporals. There are also drummers and bandsmen. See BAND.

Every battalion takes into the field 3 small-arm ammunition carts, 1 water cart, and 8 general-service wagons for baggage, requiring 45 horses. When manœuvring, a group of two or more battalions forms a brigade of infantry. A battalion is made up to war-strength by calling up reserve men. For linked battalions, see the article ARMY (BRITISH).

Battas, or **BATAKS**, a remarkable race belonging to the Malay stem, inhabiting the part of Sumatra south of Atcheen. Originally spread over the whole northern half of the island, they are now shut in on all sides from the sea, but in the highlands of the interior they have hitherto maintained their individuality and independence. According to Junghuhn, their number is about 150,000. Although in form they show the usual Malay type, they are taller and stronger than the inhabitants of the coast. In colour they are light-brown, and have somewhat prominent features and long hair. They work at agriculture and cattle-rearing, and live together in villages, protected by thickets of bamboo stakes. The government is derived from the old Malay form, and is democratic in character. Each village has its rajah, but his influence is great only in times of war. The real government is through popular assemblies, which are often stormy scenes. Slavery is an established institution, the usual cause of the loss of liberty being debt. Polygamy is permitted, though it is rare to find more than two wives in one family. A very curious custom is the institution of cannibalism as a punishment for murderers, prisoners of war, adulterers, spies, and traitors. Though surrounded by Mohammedans for centuries, they have preserved their primitive religion. They revere the memory of their ancestors, and believe in an under-world of wicked spirits (*Begus*), who must be constantly appeased by offerings. Their supreme deity is Diebata, the maker of the world, who lives in the seventh heaven, but the government of the world is committed to the three gods, Batara Guru, Sri Padi, and Mangala Bulan. These are not Malay but Indian names, and have descended from a time when Indian culture and writing, as well as Indian religious conceptions, influenced the Malay Archipelago. The Battas have reached a comparatively high stage of culture, and the arts of reading and writing are widely spread among them. They possess an alphabet apparently derived from the old Indian monumental characters, and a written literature, chiefly books on witchcraft, incantations, riddles, and stories. Their books (*Pustaha*) consist of bark or bamboo staves inscribed from bottom to top, the lines arranged from left to right. According to Junghuhn the language is nearest akin to the old Javanese and Tagal, but Schreiber attempts to establish a closer affinity with Malay proper. It has six distinct modes of speech, such as the *hata andung*, or language of funeral ceremonies, and the *hata poda*, or soothsayer's language.

Battel, WAGER OF. See BATTLE.

Batten, or **LATHE**, is the swing utensil of a loom, by which the weft or woof is struck home, and in which the shuttle runs. It is usually called the *lay* in Scotland. See WEAVING.

Battens, sawn fir timber, of smaller dimensions than the kind called planks. They are usually from 12 to 14 feet long, 7 inches broad, and 2½ inches thick. Cut into two boards, each 1½ inch thick, they are used for flooring; cut into three

boards, they are put on roofs below slates; in narrower pieces, they are put upright on walls for fixing the laths for plastering. The best battens are brought from Norway, and sold wholesale by wood-merchants.

Batter, in Architecture, used as a verb to express the manner in which the walls of towers, which are smaller at the top than the bottom, slope inwards. The walls of wharfs, and those built to support embankments and the like, usually batter.

Battering-ram, an engine of war used in ancient and medieval times. It consisted of a beam of wood, with a mass of bronze or iron on one end, resembling the head of a ram (Lat. *aries*). In its simplest form, it was borne and impelled by the hands of the soldiers; afterwards, it was suspended in a frame, and made to swing. Another form moved on rollers. The alternating motion was communicated by ropes. To protect those working it, a wooden roof (*testudo*) was constructed over it, and the whole was mounted on wheels. The beam of the ram varied from 60 to 120 feet in length, the head sometimes weighed above a ton, and as many as 100 men were employed in impelling the machine. When the blows were long enough continued, hardly any wall could resist. When or where it was invented, is unknown. The Romans derived it from the Greeks.

Battersea, a SW. suburb of London, on the Surrey side of the Thames, here crossed by the Chelsea, Albert, and Battersea bridges. In the parish church (1777) is a monument to the celebrated Lord Bolingbroke, who was born and died in a house close by. In Battersea Fields the Duke of Wellington fought a duel with Lord Winchelsea (1829). Battersea Park, 185 acres in area, was laid out in 1852-58 at a cost of £318,000; and the Albert Palace was opened in 1885. Since 1885 Battersea and Clapham have returned two members to parliament. Area of Battersea parish and of parliamentary borough, 2940 and 3304 acres; pop. (1881) 125,192 and 143,642.

Battery, a group of guns, whether field or siege, under the command of one immediate superior. A field or horse battery has 6 guns in all modern armies except the Russian, in which it has 8. The term battery includes the guns, wagons, horses, men, and all the equipment; but is also used to designate the men only, being the tactical and administrative unit of the Royal Artillery (q.v.). In foreign armies, as formerly in our own, the men of the siege or garrison artillery are divided into battalions and companies; but in the British army the same units are now called brigades and batteries. Both field and garrison batteries constitute majors' commands.

A **Mountain Battery** has four 7-pounder guns, requiring 110 mules. Its establishment is the same as that of a 9-pounder field battery, except that the 64 drivers are replaced by 94 hired muleteers.

Artillery drivers are unarmed. Gunners and non-commissioned officers, if mounted, have cavalry swords; but the gunners of garrison batteries, and the men carried on the wagons of field batteries, have Martini-Henry carbines, with sword-bayonets.

In addition to the ammunition and the arms of the men, every field battery also carries a supply of empty cartridges, port-fires, fuses, quick match, slow match, tools and small articles, besides stores for the wheelers, shoeing-smiths, and collar-makers.

When guns are grouped for siege purposes, they are placed in specially prepared works called *Siege Batteries*, protected by a bank of earth in front, and arranged with platforms, magazines, &c., so

that the guns can be conveniently worked. Four heavy guns, mortars or howitzers, are usually allotted to each battery, and the platforms on which they rest are either sunk below the surface of the ground (*sunken batteries*), or on or raised above it (*elevated batteries*). Each has a similar form—viz. a bank of earth, about 30 feet thick and 7½ feet above the gun platforms, to intercept the enemy's projectiles, and three traverses of the same height, 15 feet thick, between the guns, and extending 30 feet to the rear, to localise the effect of any shell that may burst in a gun-portion. These batteries are screened from the enemy's view, either by folds of the ground, banks of earth thrown up 100 yards in front of them, or even by artificial screens of brushwood, hurdles, or canvas, and are placed from 1500 to 3000 yards from the fortress. The guns are dragged into them either by trench railway or teams of horses detailed for that duty. See FORTIFICATION.

The following table shows the war establishments of the different batteries in the British service:

Officers and Men.	Horse.	Field.			Garrison.
		16 pr.	9 pr.	13 pr.

Battery, FLOATING. See FLOATING BATTERY.

Batthyanyi, one of the oldest and most powerful of the noble families of Hungary, which traces its origin as far back as the invasion of Pan-

nonia by the Magyars, in 894 A.D., and has given to Hungary many distinguished warriors, statesmen, and churchmen. The surname is derived from lands obtained in the 14th century.—Count Casimir Batthyanyi, a member of the principal branch of the family, was born 4th June 1807. He was Minister of Foreign Affairs in Hungary during the insurrection in 1849, in which he also distinguished himself as a military governor. After the catastrophe of Vilagos, he fled, along with Kossuth, into the Turkish territory, where he remained till 1851. He then went to France, and died at Paris, 13th July 1854.—Count Louis Batthyanyi, belonging to another branch of the same family, and born at Presburg in 1809, having espoused the national cause, yet seeking to maintain the connection with Austria and his allegiance to the Austrian sovereign, was appointed President of the Ministry, when Hungary obtained a ministry of its own, in March 1848. His ability was not equal to the goodness of his intentions, and the circumstances in which he was called to act were very difficult and embarrassing. He did not hold the office long, and afterwards took part in public affairs, chiefly as a member of the diet, and with great moderation. Yet, after the Austrians entered Pesth, he was arrested in January 1849, and on 6th October was executed by sentence of martial law. His condemnation was unexpected, and awakened the more sympathy, because all men regarded it as unjust. His estates, which were valued at £400,000, were confiscated, but were restored to his family in 1867; and in 1870 his body was removed, and interred anew, with great pomp and solemnity.—A Prince Batthyanyi (1803–53) occupied for forty-five years a prominent position on the turf, winning the Derby in 1876.

Battle, a town in Sussex, 6 miles NW. of Hastings. Encircled on three sides by wooded hills, it consists of one street, extending along a valley from NW. to SE. Till recent years Battle was noted for its manufacture of gunpowder, known as Battle powder. An uninhabited heathland then, Senlac by name, it received its present name from the Battle of Hastings (q.v.), fought here on 14th October 1066, when the Normans, led by William the Conqueror, overthrew the old English monarchy under King Harold. William, to commemorate his victory, founded in 1067, on the spot where Harold fell, a splendid Benedictine abbey, which was endowed with all the land within a league of it. The abbey had the privileges of a sanctuary, and the conqueror's sword and a roll of his barons were deposited in it. The so-called original roll is supposed to have perished in the burning of Cowdray House, near Midhurst, in 1793; and the ten copies of it extant have all been grossly tampered with. The existing buildings, Decorated and Perpendicular in style, occupy three sides of a quadrangle—two sides in ruins, the third converted at the Dissolution into a private dwelling-house. The abbey was bought in 1857 by Lord Harry Vane, afterward Duke of Cleveland. Pop. (1881) 3319. See J. B. Burke's *Roll of Battle Abbey Annotated* (1848), and Mackenzie Walcott's *History of Battle Abbey* (2d ed. 1867).

Battle (Fr. *bataille*, akin to *battre*, 'to beat'), a hostile encounter on land or sea, which will fall to be discussed under TACTICS and WAR. In 1851—the year that was to inaugurate a universal peace—Sir Edward Creasy published *The Fifteen Decisive Battles of the World*, a title from which the emphatic 'The' might have well been omitted. His list is as follows: Marathon (490 B.C.), Syracuse (413 B.C.), Arbela (331 B.C.), Metaurus (207 B.C.), defeat of Varus (9 A.D.), Chalons (451), Tours (732), Hastings (1066), Orleans (1429), defeat of

Spanish Armada (1588), Blenheim (1704), Pultowa (1709), Saratoga (1777), Valmy (1792), and Waterloo (1815). Actium (31 B.C.), Lepanto (1571), and Trafalgar (1805) might fairly have been included in the list, to which should now be added Königgrätz or Sadowa (1866), and Sedan (1870).

Battle, WAGER OF. The Wager of Battle, or as it is sometimes called, Trial by Combat, was an ancient usage in English law which permitted the accused and accuser, in defect of sufficient direct evidence, to challenge each other to mortal combat, for issue of the dispute. It obtained in civil and criminal cases, and also in military matters, to which, indeed, it was more appropriate. It consisted of a personal combat between the parties in presence of the court itself, and was grounded on the idea of an appeal to Providence, the expectation being that Heaven would give the victory to the innocent or injured party.

In charges of treason, the wager of battle was occasionally resorted to. 'It seemeth,' says Coke, 'that by the ancient common law one accuser or witness was not sufficient to convict any person of high treason; for in that case, where is but one accuser, it shall be tried before the constable or marshal by combat, as by many records appeareth.' The court over which the constable or marshal presided was called the Court of Chivalry. When the Earl-marshal sat alone, it was a military court, or court of honour; when the Lord High Constable and the court sat conjointly, it was also a criminal court. The form and manner of waging battle in cases of treason were very elaborate, and attended by imposing ceremonies. (A full account of these will be found in Blackstone's *Commentaries*, book iv.) In *Richard II.* (I. iii.), in the quarrel between Norfolk and Bolingbroke, Shakespeare has preserved a perpetual record of this chivalrous solemnity.

In civil cases, the battle was waged by champions, and not by the parties themselves; but in criminal cases, the parties fought in person, unless the appellant were a woman, a priest, an infant, or a man of the age of sixty, or lame, or blind, all of whom might refuse the wager of battle, and compel a trial by jury. Commoners could not challenge peers of the realm to wage battle, on account of their personal dignity, nor, by special charter, could the citizens of London engage in trial by combat, fighting being considered foreign to their education and employment. Whether by champions or in person, the mode of proceeding was the same. The appellee, or defendant, as he might be called, threw down his glove, and declared that he would prove his right, or defend himself with his body. The appellant, or prosecutor, in accepting the challenge, took up the glove, and replied that he was ready to make good his appeal, body for body; and thereupon the parties, holding each other's hands, joined issue before the court in a very formal and solemn manner. The combatants were obliged to swear that neither of them would resort to sorcery or witchcraft. The battle might last till the stars appeared in the evening, and the party who by that time had either killed or got the better of his opponent, was considered the successful suitor of justice. In a charge of murder, if the accused was slain, it was taken as proof of his guilt, and his blood was attainted; if he was so far vanquished as not to be able or willing to fight any longer, he was adjudged guilty, and sentenced to be hanged immediately.

So late as the year 1818, this barbarous procedure was solemnly decided by the Court of King's Bench to be a valid and legal mode of trial, which the king's subjects were free to adopt. Of course, the principle was, that all laws, no matter how

unsuitable to the times, could be enforced, unless expressly repealed by act of parliament. The case is that of *Ashford v. Thornton*, and is reported in the first volume of *Barnwall and Alderson's Reports*, p. 405. As we have stated, the court decided in favour of the validity of the ordeal, one of the judges remarking that sufficient had not been stated to induce their lordships to refuse the battle, and another more plainly and unequivocally observed that the defendant was 'entitled to this his *lawful* mode of trial.' But Lord Ellenborough put the matter more clearly by stating that 'the general law of the land is in favour of the wager of battle, and it is our duty to pronounce the law as it is, and not as we may wish it to be; whatever prejudices, therefore, may justly exist against this mode of trial, still, as it is the law of the land, the court must pronounce judgment for it.' In this case, the man at the bar was charged with murder; and he threw down the glove in token that he challenged his accuser. The latter individual, however, declined, under legal advice, to take up the glove, and so the charge was departed from. In consequence of this case, the Act 59 Geo. III. chap. 46 was passed, by which the ordeal was wholly abolished.

In Scotland, the matter would have been differently disposed of; for the judges there, following the doctrine of the Roman law, would have held the proceeding to have been in desuetude and obsolete, and there the matter would have ended.

Montesquieu, in his *Spirit of Laws*, book xxviii., very ingeniously and plausibly deduces the modern practice of duelling and the so-called laws of honour from the above form of judicial combat. See ORDEAL.

Battle-axe was a weapon much used by the early northern nations, Celtic and Scandinavian, requiring great strength in its use. Some were held with one hand, some with two; the former kind could be wielded equally by horse and foot, but the latter was for foot-soldiers only. The battle-axe had a longer handle, and a broader, stronger, and sharper blade than the common axe. During the middle ages, and somewhat earlier, it was much used in sorties, and to prevent the escalading of a besieged fortress. The *pole-axe* differed but little from the battle-axe. The *black bill* and *brown bill* resembled a halbert, having the cutting part hooked like a woodman's bill, with a spike projecting from the back, and another from the head. *Glaive*, usually a sword, was sometimes applied to a kind of pole-axe or bill used by the Welsh. See HALBERT, LOCHABER AXE.

Battle Creek, a thriving town of Michigan, on the Kalamazoo River, and at the junction of several railways, 45 miles SW. of Lansing. It has flour-mills, iron-foundries, machine-shops, and several manufactories. Pop. (1880) 7063; (1890) 13,197.

Battleford, in Saskatchewan, North-west Territories of Canada, at the junction of the Battle River with the Saskatchewan, and a little to the north of the route of the Canadian Pacific Railway. The North-west Territories were organised as a part of the Dominion in 1875, and Battleford was the seat of government from October 1876 to March 1883, when the capital was transferred to Regina (q.v.). The country near is rolling prairie, thickly grassed, without tree or scrub.

Battlement (Fr. *bâtiment*, 'building'), a notched or indented parapet formed by a series of rising parts called *cops* or *merlons*, separated by embrasures or openings called *crenelles*. Battlements were intended to enable the soldier to shelter himself behind the merlon, whilst he shot

through the embrasure. Originally military, they became freely used for architectural effect in other

Simple form of Battlement.

buildings. In churches, the battlements are frequently pierced with circles or trefoils.

Battue (from Fr. *battre*, 'to beat'), a word less used by real sportsmen than by writers on sport. The *battue* is a method of killing game on a great scale, by causing animals to be driven forward to a point where a number of guns are posted. The driving is effected by beating the bushes; hence the term *battue*. The phrase, 'a grand battue,' occurs in the *Gentleman's Magazine* for 1816; but, according to Cobden, the *battue* was unknown in 1790. Certainly, as it is practised to-day, it is quite modern; though a plan of killing deer by driving them forward in herds in an ever-narrowing circle to a place where they are to be shot is an old usage in the Highlands, where it is called the *tinchel* (Gael. *timchioll*, 'circuit'). Some people regard the *battue* as at best a mean and butcherly amusement, but Mr Henry Stevenson, author of the *Birds of Norfolk*, in defence of the heavy shooting common to Norfolk and Suffolk, says there is certainly not much bodily fatigue, but the sportsman must always be on the alert; there is every opportunity for good and bad shooting, and he is no ordinary shot who can account for one in every three of his empty cartridges. It is practised chiefly in extensive preserves of pheasants and hares during the autumn and winter months, when country gentlemen invite acquaintances to their houses for the sake of field-sports. The *battue* takes place early in the day; the number of men is usually eight or ten, each provided with at least two guns, which are loaded by an assistant as soon as they are discharged. When the guns are stationed at safe distances from each other, and ready to commence work, the beaters begin theirs by driving the game before them. Sometimes, however, pheasants will run a long way before taking to the wing, and to make them rise on approaching the guns, a low net is occasionally stretched across their path. It should be stated, however, that in the *battue*, hares, rabbits, &c. are shot as readily as pheasants; and at length the ground is covered with slain, like a field of battle. Big bags date from 1860, the first to startle the shooting world in this respect being the Maharajah Dhuleep Singh, then of Elveden Hall, Suffolk. A thousand pheasants in a single day, or even 2000, is nothing unusual; the annual total for the United Kingdom has been estimated at 335,000. One of the earliest large bags on record was made at Bradgate Park, the seat of Lord Stamford, Leicestershire, in 1864, when 14 guns in four days killed 8900 head of game. At Croxteth, in 1883, a week's shooting resulted in 7691 head of game. Such big days cheapen game, as in November 1885 cock pheasants could be bought at 2s. apiece in London; in ordinary circumstances they might have been a guinea a brace. The profits derived from this species of stock amounts on some estates to no inconsiderable sum annually. For an account of *battue*-shooting, we refer to *Shooting*, by Lord Walsingham and Sir Ralph Payne-Gallwey (2 vols. 1886).

Baucis. See PHILEMON.

Baudelaire, CHARLES, was born at Paris on the 21st April 1821. In his youth he travelled to India, and is said to have likewise visited the Mauritius and Madagascar. On his return to Paris he became a notable figure in the second group of Romantic poets who carried on the movement begun by the Romanticists of 1830. His *Fleurs du Mal*, a volume of poems issued in 1857, was the subject of a prosecution on the score of immorality, and had to undergo expurgation. He afterwards published *Les Paradis artificiels, Opium et Haschisch*, a work partly original, partly composed of selections, admirably translated, from the writings of Poe and De Quincey. His occasional essays, which were finally collected in a volume entitled *L'Art romantique*, are remarkable for the finish of the style and the subtlety of the criticism. Apart from his verse, however, Baudelaire's finest work is contained in his fifty *Petits Poèmes en Prose*. All of these are exquisitely written, and in many of them the beauty of the thought is equal to the beauty of the language. Baudelaire died in Paris 31st August 1867. He was neither a prolific nor a popular writer, and he too often misapplied his incisive intellect to repulsive subjects. He united a remarkably keen analytic faculty with a powerful, sombre imagination. Brooding melancholy, curiously tinged with irony, inspires the solemn music and dreamlike imagery of his best verses. The writer whom, in many respects, he resembles most strongly is Edgar Allan Poe. See Gautier's essay prefixed to the collected edition of Baudelaire's works (5 vols. Paris, 1872), and E. Crepet's *Œuvres posthumes et Correspondances intimes de C. Baudelaire* (Paris, 1887).

Baudry, PAUL, a French painter, was born 7th November 1828, at La Roche-sur-Yon, and studied in Paris and Rome. Among his best known works are 'Punishment of a Vestal Virgin' (1857) and the 'Assassination of Marat' (1867). He was for ten years employed in decorating the foyer of the Grand Opéra in Paris. Elected a member of the Académie des Beaux-Arts in 1870, he died 17th January 1886. See *Magazine of Art* for September 1886.

Bauer, BRUNO, one of the most audacious of recent biblical critics, was born at Eisenberg, in the duchy of Saxe-Altenburg, 9th September 1809. After his studies at Berlin, he became a *privat-docent* in the university there, and in 1839 at Bonn; but three years later he was forbidden to deliver any more theological lectures. He then removed to Berlin, and busied himself there with incessant writing of a more or less violent and polemical description on theological and political subjects, until his death at Rixdorf, near Berlin, 13th April 1882. At first an adherent of the young Hegelian school, Bauer in his earlier works explained the Christian religion as substantial truth obscured by the accretions of a confused and erroneous system of interpretation. In his books on John and the Synoptic Gospels, published in 1840-42, he maintained that the gospels were in no sense historical, but merely artistic products of the human self-consciousness. These books brought him into embittered controversies, which impelled him to retorts that were often both violent and vulgar. His pamphlet against the emancipation of the Jews, in 1843, marked the beginning of a reaction against liberalism, and from this time he abandoned theology for some years, and employed himself as a publicist and littérateur. He wrote

numerous historical works on the 18th century, in which he tries to show that the failure of the popular and national struggles in the 19th century was a result of the essential weakness of the 'enlightenment' of the 18th. Later he returned to his earlier studies, and alternated books of destructive criticism on the gospels, the Acts of the Apostles, and the Pauline epistles, with defences of Prussian conservatism. His latest work, published in the year of his death, was *Diatribe romantischer und Bismarcks sozialistischer Imperialismus*.

Bauer, CAROLINE, a German actress, born at Heidelberg in 1807, made her début in 1822, and had achieved a brilliant success, in comedy and tragedy alike, when in 1829 she married Prince Leopold, afterwards king of the Belgians. Their morganatic union was as brief as it was unhappy; in 1831 she returned to the stage, which she quitted only in 1844, on her marriage to a Polish count. She died at Zürich, 18th October 1878. Her Posthumous Memoirs (Eng. trans. 1884), with their denunciations of Prince Leopold and Baron Stockmar, offer a striking contrast to the two bright volumes of theatrical reminiscences that had preceded them in 1871 and 1875.

Bauhinia, a genus of Leguminosæ, sub-order Cæsalpinieæ. The leaves are generally divided into two lobes, which led Plumier to name this genus in memory of the united labours of the brothers John and Caspar Bauhin, two botanists of the early part of the 17th century. The species are natives of the warmer regions of both hemispheres, and some of them are remarkable for the size and beauty of their flowers. Most of them are twining plants, or *lianas*, stretching from tree to tree in the tropical forests, such as *B. vahlii*, the Maloo Climber of India, which may attain a length of 300 feet, at once smothering the highest tree-tops and strangling the stems below; but some are small trees, as *B. porrecta*, the Mountain Ebony of Jamaica, so called from the colour of its wood. The inner bark of several East Indian species is employed for making ropes; that of the Maloo Climber being employed for making suspension bridges on account of its extreme toughness. *B. retusa* and *B. emarginata*, also East Indian, exude a brownish coloured mild gum; whilst the astringent bark of *B. variegata* is used in Malabar for tanning and dyeing leather, and also in medicine; it also yields an ebony. The leaves of various species are used in Brazil as demulcent medicines, having mucilaginous properties.—Livingstone mentions a species of *bauhinia* in South Africa, called the Mopané Tree. It is remarkable for the little shade which its leaves afford. They fold together, and stand nearly erect during the heat of the day. On them the larvæ of a species of *Psylla* cause a saccharine secretion, in circular patches, beneath which the pupa of the insect is found. The natives scrape it off, and eat it as a dainty.

Baumgarten, ALEXANDER GOTTLIEB, a clear and acute thinker of the school of Wolf, was born at Berlin on the 17th of July 1714, studied at Halle, and in 1740 became professor of Philosophy at Frankfurt-on-the-Oder, where he died on the 26th of May 1762. He is the founder of *Æsthetics* (q.v.) as a systematic science of the beautiful and an integral part of philosophy. In 1750-58 he issued two volumes of his *Æsthetica*, but his death hindered the completion of the work. His writings in other departments of philosophy are marked by clearness and precision. He carried the dogmatic, rationalistic system of Wolf to its utmost development; his *Metaphysica* (Halle, 1739; 7th ed. 1779) is one of the most useful books for the study of the Wolfian philosophy. He also wrote *Philo-*

sophia Generalis (published 1770), *Ethica* (1740), *Jus Naturæ* (1765). See Joh. Schmidt's *Leibnitz und Baumgarten* (Halle, 1874).

Baumgarten-Crusius, LUDWIG FRIEDRICH OTTO, a German theologian, born at Merseburg, 1788. He studied theology at Leipzig, became in 1810 university preacher there, and in 1817 professor of Theology at Jena, where he died, May 31, 1843. As a theologian, he showed a semi-rationalistic tendency, from which, however, he was saved by a yet more powerful influence—a spiritual affinity with Schleiermacher. His best work is in the region of the history of dogma. His chief works are *Lehrbuch der Christlichen Sittenlehre* (1827), *Lehrbuch der Christlichen Dogmengeschichte* (2 vols. 1831–32), *Kompendium der Christlichen Dogmengeschichte* (2 vols. 1840–46), the last—completed from his notes by Hase—perhaps his best book.

Baur, FERDINAND CHRISTIAN, was one of the most eminent and influential of modern German theologians. It has not unjustly been said of him that he was for the criticism of the New Testament what Wolf and Niebuhr were for classical literature and history. Baur was born at Schmiden, near Stuttgart, on the 21st June 1792, became professor in the theological seminary at Blaubeuren in 1817, and was called to the university of Tübingen as professor of Theology in 1826. In his work here he spent a most laborious life, being known as the founder of the 'Tübingen School,' and at Tübingen he died 2d December 1860.

His first publication, *Symbolik und Mythologie* (1825), expounded the nature-religion of antiquity; but the main work of his life lay in the fields of church history, the history of Christian dogma, and biblical criticism. Originally a disciple of Schleiermacher, he early attached himself to the school of Hegel, and the Hegelian conception of history he in the main continued to hold from the time he published his books on Manichæism (1831) and Gnosticism (1835) till the end of his life. Of much greater importance than these were his elaborate works on *The Christian Doctrine of the Atonement* (1838) and the *Trinity and Incarnation* (1843). The *Handbook of the History of Christian Dogma* was followed by three volumes of *Lectures on the same subject*. His famous *Contrast between Catholicism and Protestantism* (1836) was written in reply to the *Symbolik* of the Catholic theologian, Möhler.

Baur's article on the 'Christ-party in the Corinthian Church,' contributed to the *Tübinger Zeitschrift* for 1831, may be said to have first indicated that conception of the early Christian Church with which his name is identified, and which in a long series of works he has compelled all subsequent writers on this period either to accept in whole or in part, or explicitly to refute. The current view of the early church was that in it peace, concord, and unity prevailed. But from a careful study of the New Testament and patristic literature, Baur came to a different conclusion. The most ancient Christianity, it seemed to him, stood very near to Judaism, the Christianity of the congregation in Jerusalem and the apostles there. Paul was the first to free the new faith from this narrowness, but the majority of the Jewish Christians and the apostles were unable to adopt Paul's wider view of the scope and mission of Christianity, and opposed it at times with passionate hostility. The Judaistic or Ebionite party long maintained the supremacy in the church, their creed differing from Judaism mainly in the belief that Jesus was the Messiah, and it was not till long after Paul's death, and mainly during the Gnostic controversies about or after the middle of the 2d century, that the contending parties were

welded together into the Catholic Church, by help of the dogmatic system of the fourth gospel, and the episcopal constitution of the church. The various stages of the process of fusion are, in Baur's belief, marked by extant documents, both amongst the books of the New Testament and in extra-canonical literature. Most of the New Testament books Baur held to have been written in the 2d century. Of Paul's epistles he accepted as genuine only those to the Romans, Corinthians (I. and II.), and Galatians; and only these genuine epistles of Paul, and the Apocalypse representing the opposite or Judaistic extreme, seemed to Baur to have been written before the year 70 A.D. The Acts of the Apostles minimised the hostilities that rent the early church, and the highest outcome of the conciliating tendency was the Gospel of John, which was of course not by the apostle, but by a writer of the 2d century. These views are developed with vast learning, ingenuity, and brilliancy of criticism in *Paul, the Apostle of Jesus Christ* (2d ed. 1867; Eng. trans. 1873–75); *Critical Investigations on the Canonical Gospels*; the *Gospel of Mark*; and *Christianity and the Christian Church of the first Three Centuries* (3d ed. 1863; Eng. trans. 1879). The later periods of church history Baur treated in four separate works—on the church from the 4th to the end of the 6th century; the church of the middle ages; the church of modern times; and the church of the 19th century. The most distinguished of those who adopted Baur's view of the early church of the leaders of the Tübingen School were Zeller, Schwegler, Köstlin, and Hilgenfeld, their principal organ being the *Theologische Jahrbücher* (published from 1842 to 1857). But Baur's disciples were very numerous, and his influence was marked on many who could not be said to belong to the school. Many of the contentions of Baur and his earlier followers have been modified by the later representatives of Baur's view; but of the school as a whole, it may be said that its leaders were the first to bring to bear on the doctrine, constitution, and literature of the early church the strict scientific methods adopted by dispassionate workers in other departments of historical research. It should be noted that Baur's main position was to some extent anticipated by Semler, and also by the English deists, Thomas Morgan and John Toland. On the school, see Baur's own work, *Die Tübinger Schule* (1859); and R. Mackay's *Tübingen School* (1863). On Baur himself, see Zeller's *Vorträge und Abhandlungen* (2d ed. 1875).

Bantain, LOUIS EUGÈNE-MARIE, a French philosopher and theologian, born at Paris, February 17, 1796. A pupil of Cousin, he became in 1816 professor of Philosophy in the College of Strasbourg. He took orders in 1828, but was much harassed by charges of heterodoxy discovered in his writings, and at one time was even suspended from his sacred function for some years. In 1848 he was appointed vicar-general of the diocese of Paris, and in 1853 a professor of the Theological Faculty. He died at Paris 18th October 1867. Besides being a very popular preacher, he wrote several philosophical books, among them *Psychologie Expérimentale* (1839), *Philosophie Morale* (1842), *La Religion et la Liberté* (1848), *La Morale de l'Évangile* (1855), and *Philosophie des Lois* (1860).

Bautzen (Wendish *Budissin*), an important manufacturing town in Saxony, situated on a rising ground overlooking the river Spree, 35 miles W. of Görlitz by rail. It is the chief town of an administrative district of the same name, which has a population (1885) of 356,383, including 50,000 *Wends*, remnants of the old Slavic population of

Eastern Germany. The chief buildings are a former cathedral (1497), and the castle of Ortenburg, dating from 958, and a frequent residence of the kings of Bohemia. The leading industries are manufactures of woollens, fustian, linen, hosiery, leather, and gunpowder. Pop. (1871) 13,165; (1885) 19,095. Bautzen was first made a town under Otho I. It suffered greatly in the war with the Hussites, and still more during the Thirty Years' War. Here Napoleon, after an obstinate resistance, won a barren victory over an army of allied Russians and Prussians, May 20-21, 1813.

Bavaria (Ger. *Bayern*), one of the states of the German empire; according to its size, the second in importance. Bavaria is divided into two unequal parts, which are separated by the Baden and Hesse-Darmstadt dominions, and of which the eastern comprises fully eleven-twelfths of the whole. Its frontiers touch also on Alsace-Lorraine, Prussia, Bohemia, Austria, and the Tyrol. Bavaria is divided into eight districts, as follows:

Districts.	Area in sq. miles.	Pop. in 1885.
Upper Bavaria.....	6455	1,004,716
Lower Bavaria.....	4153	680,616
Palatinate.....	2298	608,216
Upper Palatinate.....	3945	537,068
Upper Franconia.....	3704	578,028
Middle Franconia.....	2922	671,336
Lower Franconia.....	3245	619,865
Swabia and Neuburg.....	3787	649,460
Total.....	29,375	5,416,180

The area is a little less than that of Scotland. In 1890 the population was 5,589,932; Munich, the capital, had 348,317 inhabitants, and Nuremberg 142,403.

Surface, Hydrography, Railways, &c.—Bavaria is walled in on the SE., NE., and NW. by mountains ranging from 3000 feet to close on 10,000 feet in height. The highest elevation is reached on the south, the Zugspitz of the Noric Alps being 9665 feet high. The interior is intersected in several directions by various less elevated ranges, alternating with extensive plains and fertile valleys. The country is rich in wood, nearly one-third of its surface being covered with forests, mostly of pine and fir.

The river Rhine flows along the whole eastern boundary of the Palatinate, which is also watered by the Speyer, the Lauter, and the Queich. The Danube enters Bavaria proper at Ulm, and pursues its course through the centre of the country, until it passes out at Passau into the Austrian dominions. Including its windings, the length of the Danube in Bavaria is about 270 miles, which can be navigated throughout. The north part of the state is in the basin of the Maine. The lakes and rivers abound in fish. The *Ludwigs-Kanal* unites the Rhine and Danube, and through them the German Ocean with the Black Sea. Bavaria has altogether about 3200 miles of railway in operation, about 9000 miles of public roads, and over 5300 of telegraphs.

Climate, Soil, Products, &c.—The temperature of Bavaria varies considerably, but the climate may be described generally as mild and salubrious. The soil is very fertile, and the wealth of the country consists almost wholly of its agricultural produce. The plain south of Munich has been described as the granary of Germany, while the districts of Upper and Middle Franconia are styled the hop-garden of Bavaria. The vine is cultivated extensively in Franconia, and the wine is held in great esteem. Rhenish Bavaria also produces good wine. The quantity annually produced in Bavaria is estimated at upwards of 16,000,000 gallons. Cattle-rearing forms the exclusive occupation of the inhabitants on the slopes and at the foot of the Alps. The

forests of Bavaria annually furnish large quantities of timber. The chief minerals are salt—which is a government monopoly—coal, and iron, which is worked almost everywhere throughout the territory.

Manufactures, &c.—The manufacture of beer is carried to great perfection in Bavaria, and to an extent unparalleled in Europe. There are upwards of 5400 breweries in Bavaria, making about 110 million gallons of beer annually, which are mainly consumed in the country. Nearly two-thirds of the revenue of the state is said to be derived from this source alone. Next to beer, coarse linens and woollens are the most important products. Glass is pretty extensively manufactured, as also are iron goods, firearms, toys, paper, articles of straw and wood, porcelain, nails, needles, jewellery, chemicals, beetroot sugar, and tobacco. The mathematical, optical, and musical instruments of Munich are held in high repute. The position of Bavaria gives it a large share of the transit-trade between North Germany and Austria, Switzerland, and Italy.

Population.—The growth of the population of Bavaria has been much checked by the regulations which relate to marriages. No marriage can take place until the public authorities have given permission; in especial, until the guardians of the poor are satisfied that the persons wishing to marry have adequate means to support a wife and family. (Bavaria and Alsace-Lorraine are specially excepted from the law of 1868, valid elsewhere in Germany, which removed these restrictions.) These restrictive laws have naturally tended to increase inordinately the number of illegitimate children. Bavaria has a bad pre-eminence in this respect on the Continent. In the capital, the illegitimate births have at times almost equalled the legitimate. In 1859 the illegitimate births were 23·6 per cent. of the whole; in 1884, 13·87 per cent. (the percentage being least in the Palatinate). In 1817 the population was 3,564,757; in 1833, 4,187,390; and in 1855 it had only increased to 4,541,556. During recent years, however, the increase has been more rapid. The Bavarians, notwithstanding their beer-bibbing propensity, are essentially a sober and industrious people. In Franconia, the people are mainly descended from the Frankish stock, in Swabia from the Alleanmanian; while the old Bavarian stock is represented in the districts of Upper and Lower Bavaria, and in the Upper Palatinate.

Religion.—In 1880 the Roman Catholics numbered 3,748,032; Protestants, 1,477,312; Jews, 53,526; and other minor sects, 5908. The state allows perfect toleration, guaranteeing the same civil rights to Catholic and Protestant alike. A concordat with Rome divides the state into 2 archbishoprics and 6 bishoprics. The revenues of the Catholic Church are derived from lands and endowments, the Protestant Church is supported by the state.

Bavaria has a good system of education, under the supreme direction of a minister of public instruction. Besides elementary schools, there are about 30 *gymnasias*, and numerous technical schools of various kinds. The three Bavarian universities are at Munich, Würzburg, and Erlangen, the last being Protestant. There are several extensive libraries in Bavaria, that of Munich being one of the largest in Germany. Art has been zealously cultivated in Bavaria, and since the days of King Louis I. has been peculiarly fostered by the state. There are numerous institutions for the furtherance of painting, sculpture, and music.

Government, Revenue, &c.—Bavaria is a constitutional monarchy, the throne hereditary in the male line. Its constitution dates no further back than

1818, when it was declared a part of confederated Germany. When Bavaria in 1870 became one of the states of the German empire, she still retained certain independent privileges, including the control of her home affairs, of her postal system, and of her army in time of peace. The king is the executive, but his ministers are responsible for all his acts. The legislature consists of a chamber of senators and one of deputies. The senators are hereditary; the king, however, having the power, within certain limits, to nominate life-members. The Chamber of Deputies consists of representatives in the proportion of 1 deputy to every 31,500 of the population.

The revenue of Bavaria for 1886-87 amounted to 241,491,646 marks (almost £12,000,000), and the expenditure for the year was estimated at the same figure. The public debt in 1886 was 1,344,658,766 marks (£62,982,309), about two-thirds of it having been contracted for railways.

The army system was in 1871 remodelled on Prussian lines. The army in 1870 was formed into two corps of the imperial army, each consisting of two divisions, under the command of the king of Bavaria in times of peace, but controlled by the emperor of Germany in war. On the peace-footing, it consists of 52,863 men, without including the *landwehr*. In time of war this force is rather more than trebled.

History.—The Boii, a race of Celtic origin, appear to have conquered the country about 600 B.C., and they retained it until shortly before the Christian era, when they were subjugated by the Romans. After the decay of the Roman power, the Ostrogoths and Franks successively held possession of it, and it was a part of Charlemagne's empire. In 1180 it was transferred by imperial grant to Otho, Count of Wittelsbach, whose descendant now occupies the throne. The Rhenish Palatinate was conferred on this family by the Emperor Frederick III. in 1216. Now followed quarrels between relatives, and divisions of territory, until the dukedom of Bavaria was severed from the Rhenish and Upper Palatinates (see PALATINATE); of the latter, however, it repossessed itself in 1621—the peace of Westphalia, in 1648, confirming the title of its princes to that possession, as well as its right to the electoral dignity, to which it had been raised in 1624. In the War of the Spanish Succession, Bavaria supported France, and suffered considerably in consequence; but in 1777, on the extinction of the younger Wittelsbach line, it received the accession of the Rhenish Palatinate. In 1805 Bavaria was erected into a kingdom by Napoleon I. The king assisted Napoleon in his wars, and in consideration of his aid received large additions of territory. In 1813, however, the Bavarian king contrived to change sides opportunely, and thus managed to have confirmed to him, by the treaties of 1814-15, an extent of territory nearly as valuable as the possessions which the treaties of Presburg and Vienna had given him, and which he had now to restore to Austria. In 1818 a new constitution was granted.

In 1825 Louis I. ascended the throne. He was a well-meaning, liberal, and intellectual monarch; but he lavished the wealth of the kingdom to an extravagant degree on the embellishment of the capital, and on works of art, while neglecting works of practical value. The restriction of the freedom of the press, following the French revolution of 1830, excited so much opposition that it was soon after rescinded; but fresh dissatisfaction was created by the imposition of new taxes. The Jesuits now obtained an immense influence with the king, which they used to the detriment of popular rights. The wrath of the people was further aroused against their monarch by his connection with the

notorious Lola Montez (q.v.), who for a time wielded great influence in the state. In March 1848, following the example set by the French revolutionists, the people of Munich seized the arsenal, and demanded reforms and the expulsion of Lola Montez. The king had to consent; but in the same month he abdicated. His son, Maximilian II., ascended the throne. He died in 1864, and was succeeded by his son, Louis II. In the war between Austria and Prussia in 1866, Bavaria took the Austrian side, and after the short struggle had to pay Prussia 30 million florins (£3,000,000), and to cede some small strips of territory. It also made a defensive and offensive alliance with Prussia; and in the struggle which followed between the party which aimed at bringing Bavaria into closer and friendlier relations with Prussia and the Ultramontane or 'Patriotic' party, the former had on the whole the best of it. Munich was the main centre of the Old Catholic (q.v.) movement. On the outbreak of the great Franco-German war in 1870, Bavaria put its army under the command of the Prussian Crown Prince; and the Bavarian troops took a distinguished part in the battles of Weissenburg, Wörth, Sedan, before Paris, and on the Loire. In November 1870 the government agreed, on the granting of certain concessions, to become part of the German empire; and a month later it was the king of Bavaria who, at Versailles, proposed that the imperial crown should be conferred on the Prussian king. Since then the struggle between liberals and Ultramontanes has proceeded with varying success. King Louis carried his grandfather's love of art and music to excess; he finally went mad, and committed suicide by drowning, June 13, 1886. He should be remembered less for his artistic extravagances than for his generous patronage of the great composer Wagner. He was succeeded by his brother, Otho (also unhappily insane), under the regency of his uncle, Prince Luitpold.

Baxter, RICHARD, one of the most eminent of the Nonconformist divines, was born November 12, 1615, at Rowton, Shropshire. His father, Richard Baxter, of Eaton-Constantine, Shrewsbury, was a man of some means, but had squandered his property in gambling, so for the first ten years of his life Baxter lived with his grandfather. His education was irregular and imperfect, but he acquired immense stores of varied knowledge by private study. When eighteen years of age, he was persuaded to make trial of a court life, as the most likely way to rise in the world, and was introduced to the Master of the Revels at Whitehall; but the experiment was eminently unsuccessful, and at the end of a month he returned home, 'glad to be gone,' he says. From his earliest days he was under religious impressions, which deepened as he grew older, and led to his entering the ministry, though in very delicate health, when he was about twenty-three years of age. He was ordained by the Bishop of Worcester, and entered on the mastership of Dudley grammar-school, preaching occasionally. After a year he went as assistant to a clergyman in Bridgnorth, where he laboured for nearly two years. Originally, like his family and friends, an unhesitating conformist, he about this time found himself led by study of the controversial points to adopt some of the nonconformist views. In 1640 he was invited to officiate for the vicar of Kidderminster, where he remained for other two years. When the civil war broke out in 1642, he found his political views at variance with the public feeling of Worcestershire, and, some disorder arising, he retired to Coventry, where he ministered for two years to the garrison and inhabitants. His sympathies were almost wholly with the Puritans,

and after the victory of Naseby he acted as chaplain to one of the regiments, and was present at the sieges of Bridgewater, Bristol, Exeter, and Worcester. Whilst with the army, he employed all his eloquence to moderate the extreme views, political and religious, of the soldiers, and with considerable success. His health continuing very uncertain, he retired from the army to the house of his friend, Sir Thomas Rouse, of Rouse-Lench, Worcestershire; and here, 'in continual expectation of death, with one foot in the grave,' he wrote the first part of the best of all his works, *The Saints' Everlasting Rest*, published in 1650. On the invitation of his former parishioners, he returned to Kidderminster, and, in spite of continued bad health, laboured there for fourteen years with eminent success. 'When I came,' he says, 'there was about one family in a street that worshipped God, and when I came away there were some streets where there was not one poor family that did not do so.' At the Restoration, Baxter was appointed one of the king's chaplains, and took a leading part in the Savoy Conference. Presbyterian though he was, he did not object to a modified form of Episcopacy; yet he declined the proffered bishopric of Hereford. Shortly afterwards, in 1662, the Act of Uniformity having driven him out of the English church, he was compelled to leave Kidderminster, and was subjected to much hardship and persecution. Retiring to Acton, in Middlesex, in 1663, he spent the greater part of nine years chiefly in the composition of some of the most important of his works. The Act of Indulgence in 1672 permitted him to return to London, where he divided his time between preaching and writing. But in 1685, after the accession of James II., he was brought, for alleged sedition in his Paraphrase of the New Testament, before Judge Jeffreys, who treated him in the most brutal manner, calling him a dog, and swearing it would be no more than justice to whip such a villain through the city. Condemned to pay 500 marks, and to be imprisoned till the fine was paid, he lay in King's Bench Prison for nearly eighteen months, and was released only on the mediation of Lord Powis. The later years of his life were spent in tranquillity. He died on the 8th December 1691, in the seventy-fifth year of his age.

Baxter was a large-hearted man, and though a keen controversialist, had greater tolerance for the persons of those who were opposed to him than was common in those days. He was one of the ablest and most eloquent preachers of his time, and a most voluminous writer. His style is direct and manly; 'there is a vigorous pulse in his writings that keeps the reader awake and attentive,' and in his practical works he is intensely in earnest. Of these, *The Saints' Everlasting Rest* (1650), *Now or Never* (1663), *Call to the Unconverted* (1657), and *The Reformed Pastor* (1656) are the best known. His theological works, such as *Methodus Theologicæ*, *Catholic Theology*, and controversial works, are learned and profound, but are for the learned only. His theological catholicity and tolerance led some to regard him as an Arminian, while by others he was held to be a Calvinist. It was said of his works by Dr Isaac Barrow, with pardonable exaggeration, that 'his practical writings were never mended, and his controversial seldom confuted.' The few poems he has left are of considerable merit. The chief authority for his life is the remarkable and interesting autobiographical work published in 1696 as *Reliquiæ Baxterianæ*. A complete edition of his works in 23 vols., with a life by Orme, was published in 1830. His practical works occupy four large octavo volumes. Recent shorter lives are those by Dean Boyle (1883) and Davies (1886).

Bay is properly applied to an indentation of the sea into the land, with an opening wider than the depth. A gulf is understood to be deeper than a bay, and has often a narrow opening. These terms are often loosely applied; Baffin Bay, e.g., is really a gulf. When the body of water is large, and the entrance narrow, it becomes a shut sea, as the Baltic, the Red Sea, &c. Hudson Bay, the Persian Gulf, and the Gulf of Mexico, might with propriety be termed seas.

Bay, a name given to a number of trees and shrubs more or less resembling the Laurel or Victor's Laurel (*Laurus nobilis*), which is also called Sweet Bay (see LAUREL); the name *Bay* (Fr. *baie*, from Lat. *bacce*, 'berries'), which was once exclusively applied to the fruit, having been extended to the whole plant. The larger-leaved hardy evergreen common in shrubberies, the Common Laurel or Cherry Laurel (*Prunus Laurocerasus*), is sometimes called Bay Laurel. The true bay-leaves are frequently used for flavouring puddings,

Sweet Bay (*Laurus nobilis*).

&c.; but those of the laurel are sometimes substituted. The fumes of prussic acid given off by the latter when bruised are used by entomologists in killing butterflies and moths. Bay-rum, used by perfumers, is an aromatic liquid obtained by distilling rum in which bay-leaves have been steeped.—The RED BAY of the Southern States of America is *Laurus Caroliniensis* (see LAUREL).—The WHITE BAY of America is *Magnolia glauca* (see MAGNOLIA), and the LOBLOLLY BAY of the same country is *Gordonia Lasianthus*. See GORDONIA.

Bay-leaves with other evergreens decked houses at Christmas, were used at weddings, and were worn against thunder. The withering of bay-trees was reckoned a prognostic of evil. This is alluded to in Shakespeare's *Richard II.* (II. iv.), who is here quoting from Holinshed. The following passage occurs in Parkinson's *Garden of Flowers* (1629): 'The bay-leaves are of as necessary use as any other in the garden or orchard, for they serve both for pleasure and profit, both for ornament and for use, both for honest civil uses and for physic, yea, both for the sick and for the sound, both for the living and the dead; . . . so that from the cradle to the grave we have still use of it, we have still need of it.'

Baya (*Plocus maculatus*, *P. baya*, or *Loxia philippina*, Linn.), the common Indian and Ceylon

Weaver-bird, so called in reference to its beautifully woven hanging nest. In spite of the title *philippina*, there is not any authentic example of a Philippine species. See WEAVER-BIRD.

Bayaderes. See DANCING; NAUTCH GIRLS.

Bayamo, or SAN SALVADOR, a town in the interior of the eastern part of the island of Cuba, situated in a fertile and healthy district on the northern slope of the Sierra Maestra. It is connected by a railway with Manzanilla. Pop. about 7500.

Bayana, or BIANA, a town of India, in the Rajput state of Bhurtpur, 50 miles SW. of Agra. It was once a place of much greater importance than it now is, and was one of the most famous forts in India. The town contains many temples, and the whole ridge of the hill is covered with the remains of large buildings. Pop. (1881) 8758.

Bayard, PIERRE DU TERRAIL, CHEVALIER DE, 'the knight without fear and without reproach,' was born in 1476, at the Chateau Bayard, near Grenoble. He was perhaps the only hero of the middle ages who deserved the unmingled praise and admiration bestowed upon him—simple, modest, a sterling friend and tender lover, pious, humane, and magnanimous. After acting as page to the Duke of Savoy, he entered the service of Charles VIII., whom he accompanied to Italy in 1495. He won his spurs at the battle of Fornovo, where he captured a standard from the enemy. Early in the reign of Louis XII., in a battle near Milan, Bayard followed the defeated and retreating forces with such impetuosity that he entered the city with them, and was made a prisoner, but the Duke Ludovico Sforza released him without ransom. At Barletta, in 1502, Bayard and ten other French knights fought a tournament with an equal number of Spaniards, in order to decide their respective claims to superiority; and although seven Frenchmen were overthrown in the first charge, the result, chiefly through Bayard's bravery, after a six hours' combat, was declared equal. Next we find him fighting bravely in Spain, and against the Genoese and Venetians. When Pope Julius II. declared war with France, Bayard hastened to support the Duke of Ferrara; but failed in his scheme for making the pope a prisoner. Subsequently, he won fresh laurels in Spain. In the war with Henry VIII. of England—who with the Emperor Maximilian had threatened Picardy, and besieged Therouenne, in 1513—when the French, on one occasion, were about to lay down their arms, Bayard made a sudden attack on an English officer, and, pointing his sword at his breast, said: 'Yield or die.' The Englishman gave his sword to Bayard, who in exchange gave his own, saying: 'I am Bayard, your prisoner; and you are mine.' The emperor and the king of England exchanged their prisoners without any demand of ransom for Bayard. In 1515, when Francis I. ascended the throne, Bayard was sent into Dauphiné to make a way for the army over the Alps and through Piedmont. In this expedition he made Prosper Colonna a prisoner. Next, at Marignano, he gained a victory for the king, who, in consequence, submitted to receive the honour of knighthood from Bayard. When Charles V. broke into Champagne, at the head of a large army, Bayard defended Mézières against all assaults, and on his entry into Paris he was hailed as the saviour of his country, was made knight of the order of St Michael, and appointed commander in his own name of 100 men-at-arms, an honour till then confined to princes of the blood-royal. He was mortally wounded by a shot from an arquebus, while defending the passage of the Sesia, April 30, 1524. He died with his face to the foe, reciting the

Miserere; and to Bourbon, who came up and expressed his pity—'My lord,' he said, 'I thank you, but pity is not for me, who die a true man, serving my king; pity is for you, who bear arms against your prince, your country, and your oath.' So highly was he esteemed for all noble qualities, that his death was lamented not only by the French king and nation, but also by his enemies. His love of virtue, especially of that kindest of virtues, *justice*, was so passionate, that he was wont to declare that all empires, kingdoms, and provinces where justice did not rule, were mere forests filled with brigands. His body was taken by the enemy, but was restored to France, and interred in the church of the Minorites' monastery, near Grenoble. See the Life of him by Terrebasse (5th ed. Paris, 1871), and that (1527) by his secretary, Champier ('Le Loyal Serviteur'), of which there are English translations by Sara Coleridge (1825), Kindersley (1848), and Lurchey (1883).

Bayazid, or BAYEZED, a town of Turkish Armenia, in the province of Erzerum, beautifully situated on one of the spurs of Ala Dag, about 15 miles to the SW. of the foot of Mount Ararat. Prior to 1829 its population was upwards of 15,000, and it had a brisk trade; but afterwards the dread of Russian encroachments drove away most of its Armenian inhabitants, and the population is now but 5000, mostly Kurds. Bayazid has repeatedly been the scene of conflict. Here the Russians defeated a Turkish army in 1854. In 1877 it was seized by the Russians, but was restored by the Berlin Congress of 1878.

Bayazid' I. See BAJAZET.

Bayberry. See CANDLERBERRY.

Bay City, the fifth town of Michigan, U.S., is on the right bank of the Saginaw River, which is here spanned by three bridges, 4 miles from Saginaw Bay, and 108 miles NNW. of Detroit. It is an important railway centre, and is mostly substantially built of brick and stone, with 99 miles of straight streets, 10 miles of tramways, and two systems of electric and one of gas lighting. A large trade in timber and salt is carried on, and there is some shipbuilding. Pop. (1860) 1583; (1880) 20,693; (1890) 27,839. On the opposite bank of the river are the consolidated villages of Salzbürg, Wenona, and Banks, known as West Bay City, with a pop. of 13,000; and the village of Essex (2000) adjoins the north end of the city. An act of the state legislature of 1887 provided for the consolidation of these with Bay City in 1891.

Bayer, JOHANN, a German constructor of charts of the stars, was born in 1572, at Rhain, in Bavaria, and died an advocate at Augsburg in 1625. His zeal for the Protestant Church was so conspicuous that he was commonly called *Os Protestantium* ('the Mouth of the Protestants'). His contributions to astronomy are contained in his *Uranometria* (1603), in which he gave 51 maps of the heavens, constructed from the observations of his predecessors, and followed by explanations in his *Explicatio* (1654).

Bayern. See BAVARIA.

Bayeux, an ancient city of Normandy, in the French department Calvados, on the Aure, 15 miles NW. of Caen. Many of the houses are built of wood, and the streets have a forlorn and decayed appearance. The Gothic cathedral—the oldest, it is said, in Normandy—was rebuilt after a fire by William the Conqueror in 1077; but the present edifice dates mainly from 1106 to the 13th century. The west front, with its two 12th-century steeples, and the three sculptured porches, are notable features. Porcelain and lace are manufactured. Pop. (1881) 8006.

Bayeux Tapestry, the name given to a panorama of sewed work, representing the invasion and conquest of England by William the Conqueror, preserved in the public library of Bayeux. This is not a Tapestry (q.v.) in the usual sense of the word, but closely resembles sampler work. It is sewed on a band of linen about 230 feet long by 20 inches wide, and is divided into 72 scenes, which are generally separated from each other by a tree or other object. Most of the scenes are described by Latin inscriptions sewed along the upper margin of the tapestry. The work contains figures of 623 persons, 762 horses, dogs, and other animals, 37 buildings, and 41 ships or boats. The figures are worked in worsteds of eight different colours, dark and light blue, red, yellow, dark and light green, black, and buff. The drawing is rude, but vigorous and spirited, and no attempt is made to show local colour; horses, dogs, &c. are blue, green, red, or yellow, as may have suited the convenience of the design. To distinguish objects at different distances from the spectator, different coloured worsteds are employed, with sometimes curious effect: thus, a blue horse may have its off legs red, or a yellow one green, and so on. The method of sewing has been to cover the object with threads laid side by side, and to cross-stitch it at intervals: the faces, hands, and, where bare, the legs are simply outlined in coloured worsted. The persons mentioned by name in the inscriptions are: King Edward the Confessor, Harold, Guy of Ponthieu, Duke William, Conan, Archbishop Stigand, Bishop Odo, Eustace of Boulogne, Robert of Mortain, Leofwine, Gyrth, Turolf, Wadard, Vital, and Ælfgyva.

This pictorial history—for so it may be called, and indeed, in several particulars, it is more minute than any written history we have—opens with Harold, prior to his departure for Normandy, taking leave of Edward the Confessor. Harold is next observed, accompanied by his attendants, riding to Bosham with his hawk and hounds; and he is afterwards seen, successively, embarking from the Sussex coast;

anchoring in France and being made prisoner by Guy, Earl of Ponthieu; redeemed by William, Duke of Normandy, and meeting with him at his court; assisting him against Conan, Earl of Bretagne; swearing on the sacred relics never to interfere with William's succession to the English throne, &c.; and finally re-embarking for England. The tapestry then represents Harold narrating the events of his journey to Edward the Confessor, whose death and funeral obsequies we next see. Harold then receives the crown from the English people, and ascends the throne; and next we have the news brought to William, who takes counsel with his half-brother, Odo, Bishop of Bayeux, as to the invasion of England. Then follow representations of the active war-preparations of the Normans; their embarkation; disembarkation; march to Hastings, and formation of a camp there; the battle, the death of Harold, and the flight of the English, with which the tapestry finishes.

As an example of the Latin inscriptions describing the pictures, we reproduce one of the longest of them in reduced fac-simile:

HIC WILLELM:DVX ALLOQVITVR:
SVIS:MILTIBVS:VT:PREPARAREN
SE:VIRILITER ET SAPIENTER:AD
PRELIVM:CONTRA:ANGLO RVN
EXERCITV:

It may be translated: 'Here Duke William exhorts his soldiers to prepare themselves manfully and discreetly for battle against the army of the English.' Our illustration gives the concluding portion of this scene, and represents the onslaught of the Norman knights on the English at the battle of Hastings.

Part of Bayeux Tapestry—Battle of Hastings.

Much ingenious argument has been expended on the question of the authorship of the tapestry. It has apparently been proved to demonstration that it must have been the work of William's queen, Matilda; yet others, with equal force, insist on the authorship of the Empress Matilda, daughter of Henry I. A third party, with perhaps still stronger reasons, consider it to have been executed as a decoration for the cathedral of Bayeux,

under the orders of Odo, William's half-brother, who was, in 1048, appointed Bishop of Bayeux, a see which he held for fifty years. He took an active part in the invasion of England, appears as a prominent figure in the tapestry, and was rewarded by William with the earldom of Kent. He lavished much of his wealth on Bayeux, and rebuilt the cathedral in 1077. The fact that the tapestry exactly fitted round the nave of the

cathedral, and that, with the exception of a brief visit to Paris in 1803-4, for the inspection of Napoleon I., it has never been out of Bayeux, seems to give strong probability to the Bishop Odo theory.

Whoever may have been the author of it, there is no doubt that strong evidence exists in the tapestry itself of its having been designed at a date, if not exactly contemporary with the events depicted, at anyrate immediately afterwards.

The earliest existing mention of it is made in an inventory of the ornaments of the cathedral in 1476, where it seems to have been used at certain seasons to decorate the nave. There it remained unknown, except to the people of Bayeux, until 1724, when a drawing of a portion of it, which came into the possession of M. Lancelot, a member of the Académie des Inscriptions, finally led to its discovery a few years later. Although it has encountered many dangers from fire, revolution, invasion, and other causes, it has passed unscathed through them all; and it exists now as complete, and with its colours as fresh, as when executed.

It passed out of the keeping of the cathedral authorities towards the end of the 18th century, and was for many years in the hôtel de ville. Here it was barbarously used, being kept on a couple of rollers and exhibited to the curious by winding from the one to the other. A knowledge of its vast value, however, gradually dawned on its custodiers; and in 1842 it was deposited in an apartment built for the purpose, and placed under the care of the public librarian. This gentleman, M. Lambert, not only superintended the relining of the tapestry, but carefully and successfully restored certain portions which had suffered from age and the rollers. In 1871, during the Franco-Prussian war, the Prussians were so near the town that the tapestry was taken from the glass case in which it is displayed, and hidden till all danger was past.

The great importance of the tapestry as a contemporary record of the costumes and manners and customs of a period of such consequence in the history of England was at once recognised on its discovery, and at various times careful drawings have been made of the complete work, and about fifty works and treatises have been published concerning it. The best of these drawings was undoubtedly that made by Mr C. Stothard for the Society of Antiquaries of London. Commenced in 1816, it occupied two years' labour, and was published as vol. vi. of the *Vetusta Monumenta* by the Society in 1819. In 1872 the English Committee of Council on Education, having obtained the permission of the authorities at Bayeux, commissioned Mr Dossetter to prepare a full-sized photograph of the whole tapestry. A reduction of this photograph, edited and described by M. F. R. Fowke, and published by the Arundel Society in 1875, is the best and most complete accessible representation of this wonderful production. Our illustration has been photographed from one of the plates in this work. See Collingwood Bruce's *Bayeux Tapestry Elucidated* (Lond. 1885); *Notice Historique et Descriptive sur la Tapisserie de la Reine Mathilde* (Bayeux, 1873); *La Tapisserie de Bayeux*, by Jules Comte (Paris, 1878), and also Fowke's work, which gives a very complete bibliography of the subject.

Bay Islands, a small group in the Bay of Honduras, 150 miles S.E. of Balize. The cluster was proclaimed a British colony in 1852, but in 1859 they were ceded to the republic of Honduras. The chief of the six islands are Roatan (30 by 9 miles; 900 feet high), and Guanaja, whence in 1502 Columbus first sighted the mainland of America. Total pop. 5000.

Bayle, PIERRE, one of the most independent thinkers of the 17th century, was born in 1647 at Carlat, near Foix, in Languedoc. The son of a Calvinist pastor, he yet studied philosophy under the Jesuits at Toulouse. The arguments of his tutors, and still more his friendly intercourse and quiet disputation with a Catholic clergyman who lived in the neighbourhood, led him to doubt the orthodoxy of Protestantism, and shortly prevailed so far that he openly renounced his father's creed, and adopted Catholicism. But in seventeen months the conversation of his relatives brought him back to the Protestant profession. To escape ecclesiastical censure, he withdrew to Geneva, and thence to Coppet, on the Lake of Geneva, where he studied the philosophy of Descartes. After a few years he returned to France, and in 1675 was elected to fill the chair of Philosophy in the university of Sedan. In this office he remained until 1681, when the university was suppressed. His next appointment was that of professor of Philosophy at Rotterdam. The appearance of a comet in 1680 having given occasion to a widely spread alarm, Bayle in 1682 published his *Pensées Diverses sur la Comète*, a work full of learning, and treating, in discursive style, many topics of metaphysics, ethics, theology, history, and politics. This was followed by *Critique Générale de l'Histoire du Calvinisme de Maimbourg*. In 1684 he commenced a periodical, *Nouvelles de la République des Lettres*, one of the first successful attempts at a popular journal of literary criticism. The revocation of the Edict of Nantes led Bayle to write his *Commentaire Philosophique sur ces Paroles de l'Evangile: 'Contrains les d'entrer,'* which professed itself to be a translation from the English, and contained a strong defence of the principle of toleration. In consequence of the accusations brought forward by the theologian Jurieu, who regarded Bayle as an agent of France, and the enemy of Protestantism, Bayle, though he skilfully defended himself, was in 1693 deprived of his license to teach. He now assiduously devoted his leisure to the *Dictionnaire Historique et Critique* (1st ed. 2 vols. Rotterdam, 1696; latest ed. 16 vols. Paris, 1820). This was the first work published under his own name. Again Jurieu came forward as Bayle's adversary, and induced the consistory of Rotterdam to censure the Dictionary, chiefly on account of the supposed irreligious tendency of the article on 'David,' and the commendation bestowed on the moral character of certain atheists. Bayle promised to expunge all the objectionable matter; but afterwards, when he found that the public entertained a different and more favourable opinion of the passages than the Rotterdam Consistory, he judged it best to allow them to remain as they were, or made only slight alterations. New opponents were called into the arena by his *Réponse aux Questions d'un Provincial*, and the continuation of his *Pensées sur la Comète*. Jacquelot and Leclerc now attacked his religious opinions, while others persecuted him as the enemy of Protestantism and of his adopted country, Holland. These literary and theological controversies had a bad effect on his failing health, and a disease, for which he refused to employ medical aid, proved fatal. He died December 28, 1706.

Accustomed to view every question scrupulously on all sides, Bayle was accused of doubting on religious matters generally; at least, it is not to be denied that his scepticism disbelieved the wisdom of the religious dogmatism that ruled both Catholics and Protestants in his day. His hostility to bigotry rather originated in his indifference to the doctrines about which theologians quarrelled, than in any clear conviction of the

iniquity of religious persecution. His scepticism was not based on a philosophical theory, but was rather that of an accomplished littérateur. With great eloquence and persistency he vindicated the doctrine that moral characteristics may flourish independently of particular religious opinions. His learning was perhaps more varied and curious than precise; his style is clear and natural, fluent but diffuse. Many articles in the Dictionary seem to have been chosen merely as vehicles to introduce numerous digressions in notes, not a few of which are prolix and uninteresting; but the greater number of the articles are characterised by good sense, logic, critical acumen, and learning. The work was proscribed both in France and Holland, was consequently very widely diffused in both countries, and exercised an immense influence over the literature and philosophy of the Continent. It was the dawn of the scepticism of the 18th century, and may be historically regarded as the protest of the enlightened human intellect against the irrational dogmatism of the churches. In his personal character, Bayle was amiable, obliging, disinterested, and modest, but at the same time morally courageous and independent. His *Œuvres Diverses* were published in four volumes at the Hague (1725-31). See Life of Bayle, in French, by Desmaizeaux (Amsterdam, 1730), and in German by Feuerbach (1838).

Bayly, THOMAS HAYNES, an English songwriter and author, was born at Bath, October 13, 1797. After deserting successively both law and the church, Bayly, during a short sojourn amid the brilliant society of Dublin, first discovered his own powers as a ballad-writer and achieved his earliest successes. In 1824 he settled in London; and his *I'd be a Butterfly* was quickly followed by *The Soldier's Tear, We met—'twas in a Crowd, She wore a Wreath of Roses, Oh, no, we never mention her*, and many others, familiar wherever the English language is spoken. Bayly also wrote a novel, *The Aylmers*, several volumes of verse, some tales, and numerous dramatic pieces, the best of which was *Perfection*, a clever little comedy, produced by Madame Vestris, and once very popular. In his last years he suffered much from confirmed jaundice and dropsy, which brought about his death, April 22, 1839.

Bayne, PETER, born at Fodderty, Ross-shire, 19th October 1830, studied at Marischal College, Aberdeen, and became editor of newspapers successively in Glasgow, Edinburgh, and London. He is author of *Christian Life at the Present Time*, *The Life of Hugh Miller* (1871), *Lessons from my Masters*, *Two Great Englishwomen*, and a *Life of Luther* (1887).

Baynes, THOMAS SPENCER, born at Wellington, Somerset, 24th March 1823, studied at Bristol College and Edinburgh University. At Edinburgh he became assistant to Sir William Hamilton, publishing a translation of the *Port Royal Logic* (1851), and an *Essay on the New Analytic of Logical Forms* (an exposition of Hamilton's *Quantification of the Predicate*). In 1857-64 he was assistant-editor of the *Daily News*, and in 1864 became professor of Logic, Rhetoric, and Metaphysics in the university of St Andrews, where he remained till his death, 30th May 1887. He wrote much for reviews and magazines, and was editor of the ninth edition of the *Encyclopædia Britannica* (vols. i.-xxii. 1875-87).

Bay of Islands, a safe and extensive harbour on the east coast of the northernmost portion of the North Island of New Zealand. It is about 11 miles across, and is so named from the numerous islands (numbering nearly a hundred) with which it is studded. Vessels of any draught may enter.

Russell, the chief shipping port in the north of New Zealand, is on its south side.

Bayonet, supposed to be named from Bayonne, of which Puséygur, its alleged inventor (circa 1650), was a native, is a dagger or small spear fixed at the end of a musket or similar weapon. According to some authorities, the bayonet is just the Malay Kris (q.v.), introduced by Dutch soldiers from the East Indies; anyhow, it is certain that bayonets were manufactured at Bayonne in 1663. These, called *bayonets-à-manche*, had handles which fitted into the muzzle of the guns; but the *bayonet-à-douille*, or socket-bayonet, fitting round the barrel, so that the musket could be fired with the bayonet fixed, was invented by General Mackay in 1689, and introduced by Vauban into the French army in 1703. Bayonets are of two patterns. That with which the rank and file of the British infantry are armed is triangular in section, fitting round the rifle barrel by means of a socket, is 22 inches long, weighs

15½ oz., and is only adapted for thrusting; while the sword-bayonet is a cut-and-thrust weapon of the same weight, 24 inches long, sharpened on its front edge, and sometimes s.w.-backed; its hilt fits round the barrel, and its handle on to a button at the side of it. It is carried by rifle regiments, gunners, engineers, departmental troops, all infantry sergeants, and seamen, being better adapted to the shorter rifle with which they are armed. The triangular socket-bayonet is made at the government rifle factory at Enfield as follows: Two pieces of metal are first selected, one of the very best cast-steel, 7 inches long by ¾ inch square; the other of the best wrought-iron, 4 inches long by about 1 inch thick, and welded together. The steel forms

A, Bayonet;
B, Sword-bayonet.

the blade, the iron the socket-handle. A forging-machine gives a rough outline of the required shape. Then a swaging-machine, with dies and counter-dies, comes down upon the metal with great force. The metal is then annealed; turned in a cutting-machine to remove a wire-edge thrown up in the act of stamping; cut to a proper length; the socket-end made square; the blade drilled and bored, shaped and furrowed, bent at the neck, hardened, tempered, and finished by several minor operations. The sword-bayonets are supplied by contract. According to *The Times* of 11th February 1886, 'one-third of the British army is armed with weapons which will fail our soldiers in the hour of need'; and this remark was to a great extent verified during the operations in the Soudan, where many bayonets of both patterns were twisted and bent in charging—especially some naval sword-bayonets which had been made out of old cutlass blades. To guard against a repetition of this, all the bayonets in use in the United Kingdom were re-tested early in 1887. The triangular bayonets were sprung on all three faces round a curved block 2½ inches high in the centre, struck twice on each flat, gauged and twisted

from point to socket through a quarter of a circle. Out of 166,000 thus tested, upwards of 70 per cent. passed the tests, the failures being amongst those longest in use. The 35,000 army sword-bayonets were similarly tested, and 90 per cent. passed. Troops at home are now furnished with bayonets which have been re-tested, and supplies of the same have been sent to those abroad. All new weapons now have to pass the above tests, and a contract (1887) for sword-bayonets required that the blade should stand a weight of 160 lb. on the point without the slightest deviation, and a blow on the back of 170 lb. from a proving-machine. The dagger-like bayonet for the magazine-rifle (see RIFLE) is quite unlike the others.

Bayonne, one of the most strongly fortified towns of France, in the department of Basses-Pyrénées, situated at the confluence of the Adour and Nive, 4 miles from the mouth of their united waters in the Bay of Biscay, and 63 miles WNW. of Pau by rail. The two rivers divide the town into three parts—Great Bayonne, Little Bayonne, and St Esprit. Pop. (1872) 27,173; (1881) 20,957. Many of its streets are narrow and dark, but the town still wears an air of wealth and comfort, spite of its declining prosperity from the competition of the railway and the gradual filling up of the mouth of the Adour. The river formerly emptied by a mouth 12 miles farther north than its present one, which it opened for itself in the 16th century. The manners of the inhabitants as well as the architecture remind us of Spain, only 22 miles distant, but among the poorer natives the Basque type and the Basque tongue are predominant. Of the seven churches the finest is the cathedral, in the oldest part of the town, begun in the 13th century, with its three naves, its stately portal, and its elaborate roof. The citadel, on a height in St Esprit, was one of Vauban's masterpieces. Having opened its gates only during the armistice in 1814, it still bears its proud motto, '*Nunquam polluta*.' The chief manufactures are brandy and liquorice, besides chocolate, leather, tobacco, and glass (especially bottles); and in these products, together with wine, corn, cork, wax, oil, wool, and the celebrated Bayonne hams, there is a large trade with Spain and Northern Europe. Bayonne belonged to the Duchy of Aquitaine, then to Gascony, and was in the hands of the English from 1152 to 1451. During the wars with Spain it was often besieged, but never taken. Here the great Napoleon cozened Charles IV. out of the crown of Spain, after he had ineffectually endeavoured to get Ferdinand VII., to whom Charles had previously resigned it, to give it up. In 1814 it was besieged in vain by the British and Spanish allies, and was the scene of a series of desperate bloody struggles. In five days' fighting on the banks of the Nive, south-east of Bayonne (December 1813), the French lost 6000 men, the allies upwards of 5000, and in the bloody sortie from Bayonne of April 1814, as many as 800 English soldiers fell.

Bayonne, a city of New Jersey, U.S., about 6 miles SW. of New York by rail. It is made up of four former villages, lying along the narrow peninsula to the south of Jersey City, between New York and Newark bays, and has a large coal-dock, and chemical and other works. Pop. (1880) 9372; (1890) 19,033.

Bayreuth. See BAIREUTH.

Bay-window, or (corruptly) Bow-window, a window peculiar to late Gothic and Renaissance architecture, so called because it forms a *bay* or projecting space outwards from a room. The external walls of bay-windows are, for the most

part, either rectangular or polygonal, the semi-circular form, from which the term *bow* was probably derived, having been unknown prior to the introduction of the debased Gothic. Though

Bay-window; Cowdray House, Sussex (from Parker).

mentioned by Chaucer, bay-windows are not found in any of the styles before the Perpendicular, during the prevalence of which they were frequently introduced, particularly in halls. Bay-windows generally reach to the floor, and are frequently supplied with a seat, which is called the *bay-stall*. There are many very beautiful examples of bay-windows in the college-halls of Oxford and Cambridge. When used in upper stories, such windows are supported on corbels, or large projecting mouldings. See ORIEL.

Baza, an old town of Spain, 50 miles ENE. of Granada. It lies in a fertile plain, has remains of Moorish fortifications, a sulphur-spring, and (1878) 12,992 inhabitants engaged in the production of wine, fruit, and hemp. The *Bastia* of the Romans, and *Bastania* of the middle ages, Baza under the Moors was a flourishing town, with a population of 50,000.

Bazaar, or BAZAR (Pers. *bāzār*), an oriental market-place, either open or covered, where various articles, including slaves, are exposed for sale, and where eastern merchants meet for transaction of business, as on 'Change or at the Bourse in England and France. The bazaar in Ispahan is one of the finest; that in Tabriz perhaps the largest. The great bazaars of Constantinople and Cairo are better known to Europeans. Among western peoples, establishments for the sale of fancy goods are now often styled bazaars. The name is also commonly applied to a sale of miscellaneous articles, contributed gratuitously, for the purpose of raising money for a charitable or other special purpose.

Bazaine, FRANÇOIS ACHILLE, a marshal of France, born at Versailles, 13th February 1811. Entering the army in 1831, he served with distinction in Algeria, in Spain, in the Crimea, and in the Italian campaign of 1859. He took part in the French expedition to Mexico in 1862, and from 1863 till the end of the war held supreme command of the French forces. Already, in 1836 in Africa, he had gained the cross of the Legion of Honour; in 1856 he had been promoted to be Commander of the Legion; in 1863 he received the Grand Cross; and in 1869 he was made commander-in-chief of the Imperial Guard. At the outbreak of the great war with Germany, Bazaine was placed at the head of the 3d army corps near Metz. After the battles of Wörth and Forbach he took command of the main French armies, and on August 14, 1870, began a retreat from Metz. Defeated at

Mars-la-Tour and Gravelotte, he retired within the fortifications of Metz, which was immediately invested by Prince Frederick Charles. Attempts to escape failing, Bazaine capitulated October 27; when 3 marshals, over 6000 officers, and 173,000 men laid down their arms and became prisoners of war. In 1873 Bazaine was tried by a court-martial, and sentenced to degradation and death for having failed to do his duty. The sentence was commuted to 20 years' imprisonment. But in 1874 Bazaine contrived to escape from the fortress on the Ile Ste Marguerite, near Cannes, where he was confined, and ultimately he made his way to Madrid. He published in 1883 a justification of himself in *Episodes de la Guerre de 1870 et le Blocus de Metz*, which was immediately prohibited in France. He died 23d September 1888.

Bazard, SAINT-AMAND, a French Socialist, was born at Paris in 1791. After the Restoration he helped to found the revolutionary society of the 'Amis de la Vérité,' and in 1820 an association of French Carbonari. He was the leading conspirator in the 'plot of Belfort.' In 1825 Bazard, impressed with the necessity of a total reconstruction of society, attached himself to the school of Saint-Simon, and became one of the editors of a Saint-Simonian journal termed *Le Producteur*. In 1828 he delivered at Paris a series of lectures, the substance of which was published in the *Exposition de la Doctrine de Saint-Simon* (2 vols. 1828-30), of which the first part was by Bazard, the second being chiefly the composition of Enfantin. He and Enfantin became the acknowledged leaders of the school. After the July revolution (1830) a larger scope was afforded to the Saint-Simonians. The masses were attracted by the doctrine that 'all social institutions ought to have for their end the moral, intellectual, and physical amelioration of the poor.' In a short time Bazard and his friends had 'created a new society, living in the midst of the old,' with peculiar laws, manners, and doctrines. But Bazard's connection with it was of short duration. He differed from Enfantin on the doctrine of the emancipation of women, and in 1831 seceded in disgust. His efforts to found a school of his own proved unsuccessful, and during a heated discussion with his former friend Enfantin, he was struck with apoplexy, from the effects of which he never recovered. He died 29th July 1832.

Bazardjik, a town of Bulgaria, 26 miles N. of Varna, has an important fair in April. Pop. (1881) 9545. Founded 300 years ago, it was stormed by the Russians on 2d June 1774, and 3d June 1810.—**TATAR-BAZARDJIK**, a town of Eastern Roumelia, on the Upper Maritza, 23 miles W. of Philippopolis by rail, with warm baths, and 13,000 inhabitants, having greatly increased since the Russo-Turkish war of 1877-78.

Bazelles, a village in the French department of Ardennes, near the right bank of the Meuse, 4 miles SSE. of Sedan. A pretty, well-to-do place, it was burnt to the ground by the Bavarians on the day of the battle of Sedan (1st September 1870), in revenge either for its obstinate defence by the marines, or for the villagers having fired on the invaders, and maltreated some of their wounded. It was rebuilt, in great measure with English contributions, and now has some 2000 inhabitants.

Bazigars, a tribe of natives scattered over India, known also as Panchpiri, Kunjra, or Nata, most of whom lead a nomadic life. They do not intermix with the Hindus. It has been remarked that they have some features of resemblance to the Gipsies of Europe and Asia. They are of seven castes; the Bazigars proper are Mohammedans in religion and habit; the Panchpiri have no set system of religion, but with native flexi-

bility adopt that of the village or place where they may be sojourning. The men collect medicinal herbs, exhibit wild beasts, or sell mats of their own manufacture, are adroit jugglers, and excel in feats of activity; some of the women sell trinkets, and excel in lascivious dances; others practise physic and cupping. They are short-lived, owing to their lives of systematic debauchery.

Bazoche, or BASOCHE, the guild of the clerks of the parliament of Paris, under a mock king, to whom Philip the Fair granted the privilege of performing religious plays in 1303. The officers of this harmless monarchy affected on all occasions the language of royalty. Its jurisdiction included the consideration and decision of all controversies that arose among the clerks, and it administered justice twice a week. At the carnival the members acted a species of satirical Morality (q.v.), in which they made extensive use of the liberty granted to them, in ridiculing vices and the favourites of fortune. Of course, they could not fail to provoke enmity and occasion serious scandal, and in 1540 they were interdicted as incorrigible. They are interesting, however, as the forerunners of the comedy of Molière.

Bdellium, a gum-resin resembling Myrrh (q.v.) in appearance and qualities, but weaker, and at the same time more acrid. High medicinal virtues were ascribed to it by the ancients, but it is now little used internally, although occasionally employed as an ingredient of plasters. It is supposed to be the produce of *Amyris Commiphora* in India, and of *Balsamodendron Africanum* in Senegal—trees or shrubs belonging to the natural order Amyridaceæ (q.v.), so remarkable for the number of similar substances which it produces.—Egyptian bdellium, however, is obtained from the Doom palm, *Hyphæne thebaica*. A similar substance is yielded also by *Ceradia furcata*, of the natural order Compositæ; whilst the Sicilian bdellium, formerly used in medicine, is produced by *Daucus gummifer*, a species of the same genus to which the carrot belongs.—The bdellium mentioned in Gen. ii. 12 and Num. xi. 7 may be this or a similar gum-resin; some have, with more probability, understood it to be a precious stone—a carbuncle, crystal, beryl, or pearl.

Beaches, RAISED. Geology teaches that the frame of the land is liable to risings and depressions, even in the present age. Several districts in different parts of the world have been raised, in consequence of earthquakes, within the memory of the present generation; and there is evidence to show that the coast of Siberia east of the Lena, Spitzbergen, Nova Zembla, and the Scandinavian Peninsula (with the exception of Scania, in the extreme south), have been recently elevated. These facts prepare us to learn that, around the British Islands, and in other parts of the earth, there are tracts of ground at various elevations above the present sea-level which have evidently been sea-beaches at a former time. The evidences consist of, first, the levelness of the ground in the general direction of the present shores over considerable spaces; second, the alternating beds of sand and gravel, such as we see composing the present beach; and, third, the presence of marine littoral shells. There are also what may be called terraces of erosion—indentations made in a rocky coast by the lip of the sea in ancient times—usually consisting of a flat platform presenting patches of gravel, and of a backing wall or sea-cliff, the latter sometimes penetrated with deep caves. In Scotland there are several well-marked raised beaches, at 100, 75-80, 45-50, 25-30 feet above the present sea-level. These beaches are best seen about the maritime regions of Central Scotland. Most of the

seaport towns are built upon the 25-30 feet beaches. Similar beaches are found in Ireland, and likewise in England, where, however, they do not occur at a greater elevation than 20 to 30 feet above the sea. Terraces of marine erosion (*Strandlinier*) occur in Northern Norway at various levels, up to a height of 600 feet or thereabout. In high Arctic regions raised beaches are also common phenomena. Some of the most remarkable examples, however, occur in South America, where Darwin noticed them at various levels, from 65 feet up to 1000, and even 1300 feet (near Valparaiso), above the existing sea-level. See Dr Robert Chambers, *Ancient Sea Margins* (1848), and the standard works on geology.

Beachy Head, the loftiest headland on the south coast of England, projecting into the English Channel, $3\frac{1}{2}$ miles SSW. of Eastbourne, Sussex. It consists of perpendicular chalk-cliffs, 575 feet high, forming the east end of the South Downs. Several caverns have been cut out in the rock, for shipwrecked seamen to take refuge in; but shipwrecks have been far fewer since 1831, when the Belle Tout Lighthouse was built $2\frac{1}{2}$ miles to the west. This lighthouse is 285 feet above the sea, and is seen above 20 miles off. The view from Beachy Head, in clear weather, extends to Hastings, the Isle of Wight, and France. The cliffs are the resort of myriads of sea-fowl. Off this point, the French fleet, under Tourville, beat the combined English and Dutch fleets, under Torrington, 30th June 1690.

Beacon denotes any signal set upon a height, but especially the alarm-fires at one time used to spread the intelligence of foreign invasion or other great event. These fire-signals were in use in the earliest times, and notices of them are found in the literary remains of ancient Persia, Palestine, and Greece. They were made by kindling a pile of wood on the tops of lofty mountains, and keeping the flame bright by night, or having the fire so covered as to emit a dense smoke by day. There were various preconcerted modes of exhibiting the light or smoke, so as to indicate the nature of the intelligence. Thus, an act of the parliament of Scotland in 1455 directs that one bale on fire shall be warning of the approach of the English in any manner; two bales blazing beside each other, that they are *coming indeed*; and four bales, that they are coming in great force. *Bale* is akin to the Sansk. *bhālas*, 'lustre'; *beacon* is a word of doubtful etymology, not found beyond the Teutonic languages.

An early instance of beacon-signals is found in the book of the prophet Jeremiah, in his call, in chap. vi. 1, to the people of Benjamin to kindle a fire-sign on one of their mountains: 'Set up a sign of fire in Beth-haaccerem; for evil appeareth out of the north, and great destruction.' Another ancient instance of the use of a line of beacons occurs in the *Agamemnon* of Æschylus. The Greek commander is represented as communicating the intelligence of the fall of Troy to his queen, Clytemnestra, at Mycenæ, in the Peloponnesus. The line consists of eight mountains, and the news is supposed to be conveyed in one night from Troy.

In England the beacons were kept up by a rate levied on the counties, and had watches regularly stationed at them, and horsemen to spread the intelligence during the day, when the beacons could not be seen. They were carefully organised when the Spanish Armada was looked for. In 1856 an old beacon-work on Malvern Hill, which had done its part in former days in spreading the intelligence of the appearance of the Armada, of the Dutch fleet, and of the Young Chevalier, was lighted up in anticipation of the close of the Crimean war, and afforded an interesting amusement to scientific persons in estimating the distance at which the blaze

could be seen from distant hills. Again, on the night of 21st June 1887, a multitude of jubilee beacons, throughout the length of the kingdom, received their signal from Malvern Hill, the time taken for its transmission thence to the Lake country being seven minutes.

Beacon, in maritime affairs, is an erection of stone, timber, wrought-iron, cast-iron, or concrete, placed upon a rock or bank dry at low water, but covered at high water, and lying near the track of shipping, either on the open coast or in navigable rivers or estuaries. All beacons on the open sea-board, or on lochs used as harbours of refuge, are erected in England by the Corporation of the Trinity House, London; in Scotland by the Commissioners of the Northern Lighthouses; and in Ireland by the Ballast Board of Dublin. In navigable rivers they are erected by the improvement trustees. Dues for beacons are not levied upon shipping by the national authorities. On the open coast, beacons are made of a considerable size, to give a chance of their being made out in the dark, and also of great strength, to resist the shocks of the heavy breaking seas which fall upon them.

In Scotland the principal examples of stone beacons are those on the South Carr Rock in the Firth of Forth, the North Carr Rock off Fifeness (which is partly of cast-iron), the Beamer Rock at Queensferry, and the Gantocks in the Firth of Clyde; the two former of these, being exposed to a very heavy sea, are built solid of hard stone joggled together, and are 42 feet in height and 14 feet in diameter at the base. Iron beacons are open pyramidal structures, surmounted by a cage or barrel-shaped top (fig. 1). They cost from £50 to £1200 or £1400, the heavier cost applying to the larger class in exposed situations, and when the rock is low in the water. Belonging to this latter class may be named Cairnbulg Brigs, Covesea Skerries, Stroma Skerries, Cantick Head, Lother Rock, &c. One of the main columns of these large beacons is provided with steps, so that any one cast upon the rock or reef may ascend to the cage on the top, which is capable of holding eight or ten persons.

Two principal types are followed by the English authorities. Fig. 2 represents the class of beacon

Fig. 1.—Elevation of a First-class Cast-iron Beacon; total height above high-water, 36 feet.

Fig. 2.—Total height above high-water, 26 feet.

used by them for rock foundations. It consists of strong cast-iron plates, closely fitted and securely bolted together, the interior being filled with Portland cement rubble; and surmounting it is

Fig. 3.—Section of Wrought-iron Cylinder Beacon; height above high-water, 30 feet.

an iron mast, carrying a ball, triangle, diamond, or cone, as its locality may require. As much as £11,000 has been spent in one instance on the erection of such a beacon. Fig. 3 represents the beacon on the Girdler Bank, in the Thames, and is a type of the class of beacons used for sand-banks. It consists of a wrought-iron tube, 2 feet 7 inches in diameter, sunk into the sand, with a second length of tube added, to carry the beacon above the high-water level. In the latter is secured the mast which carries the distinguishing mark of the position. Other forms also are used. The Monkstone, in Bristol Channel, has an erection of masonry in the form of a tower, with a stair of ascent from the rock to the top, which is protected by an iron railing; and on Old Law, Holy Island, the beacon takes the shape of a lofty obelisk of stone, which forms an important sea-mark. On the Irish coast, simple perch beacons, initialed or otherwise distinguished, are common, as on the Carrick Rocks, near Wexford, and on Foreland Point, at the entrance to Belfast Lough.

Beacon Lighting.—It has been proposed to light up beacons by electricity from the shore, but it has not as yet been successfully accomplished. Experiments conducted with this object by the Northern Lighthouse Commissioners showed that a spark could be produced that was visible in clear weather for a distance of about a mile; but the result did not justify the adoption of the system. There are instances, however, of beacons lighted by gas with perfect success. The Clyde Lighthouse Trustees have erected an iron tower on a bank off Port Glasgow Harbour, to which a gas-pipe has been led under water, and carried up to the lantern on the top. The gas is turned down during the day and raised at night by a stop-cock on shore. Another instance is the beacon erected by the Clyde Lighthouse Trustees on the Gantocks Rock, near Dunoon. The beacon is of stone, surmounted by an iron tank which holds about one month's supply of compressed gas, on Pintsch's principle; above this tank is placed the lantern containing the dioptric apparatus. The light burns day and night. The gas is supplied to the tank from the tender belonging to the Trust; this is fitted with tanks which are charged at their gas-work at Port Glasgow with gas raised to a pressure of ten atmospheres. The gas is passed from the vessel to the beacon by means of a strong india-rubber tube. The tank on the beacon is charged to six atmospheres. Four beacons lighted on Pintsch's principle have been erected in the Clyde, one in the Thames, three in the Suez Canal, one at Pillau, Germany, one in Holland, and one on Romer Shoal, New York. Where a beacon is placed near a lighthouse, as at Stornoway, it may be lighted by a beam of light projected from the lighthouse, which is reflected seaward by an apparatus placed upon the beacon. See BUOY, LIGHTHOUSE.

Beaconsfield, a quiet little market-town of Buckinghamshire, 10 miles N. of Windsor. It is noteworthy as the home and the burial-place of

the poet Waller and of Edmund Burke, and as having given his earl's title to Benjamin Disraeli. Pop. of parish (1881) 1636.

Beaconsfield, BENJAMIN DISRAELI, EARL OF, statesman and novelist, was born 21st December 1804, in London, most likely at 6 King's Road, Bedford Row. He was the eldest son of Isaac D'Israeli (q.v.) and Maria Basevi, and was the descendant of a Jewish family which, driven from Spain by the Inquisition towards the close of the 15th century, had taken refuge in Venice, and thence had migrated to England in 1748. He was duly circumcised at the Spanish Synagogue in Bevis Marks, but in 1817, a boy of twelve, was baptised at St Andrew's, Holborn, with Sharon Turner for godfather, and entered thus on all the privileges from which the Jewish race was still debarred. He was educated partly at a private school kept at Walthamstow by a Unitarian minister; in 1821 was articled to a solicitor; in 1824 entered Lincoln's Inn, and kept nine terms; but in 1831 had his name removed from the books. In 1826 he published the first part of *Vivian Grey*, not an over-bold forecast of his own achievements, so sparkling, arrogant, and egoistic, so full of piquant burlesque of the men and events of the day, that it straightway became the talk of the town, and gained him admission to the Blessington coterie. The second part, now little read, succeeded in 1827; the Gulliverian *Captain Popenilla* in 1828; and the high-flown *Young Duke* in 1829. In 1830-31 he took a twelvemonth's holiday in the Mediterranean, visiting Spain, Venice, Jerusalem (the homes of his ancestors), and describing his doings in the fourteen graphic *Home Letters* (1835), where we see him young, brilliant, foppish, affectingly affected, just as we know him in Maclise's portrait.

He returned to England to find the country in the throes of the Reform Bill; and in 1832 stood twice for Wycombe as an advanced Radical, backed by O'Connell and Joseph Hume. He failed both times, and failed again in 1835, when as a Tory he contested Taunton, quarrelling with O'Connell, and sending a challenge to O'Connell's son. Not until 1837, the first year of Victoria's reign, did he enter parliament, as member for Maidstone. Meanwhile he had published *Contarini Fleming* (1832), a 'psychological romance,' a 'story of the development and formation of the poetic character'; *The Wondrous Tale of Alroy* (1833), a stilted romance of the 12th century; *The Revolutionary Epick* (1834), a blank-verse rigmarole, the idea of which was conceived on the plains of Troy, and which justified tyrannicide in a passage expunged from the 1864 edition; *Vindication of the English Constitution* (1835); *Henrietta Temple* (1836), a 'love-story,' a lawless one; and *Venetia* (1837), where Byron and Shelley figure thinly disguised. His maiden speech, on Irish election petitions, was clever enough, yet was greeted with shouts of laughter, till, losing patience, he cried, almost shouted: 'I have begun several things many times, and have often succeeded at last; ay, and though I sit down now, the time will come when you will hear me.' In less than nine years that time did come. A reckless free-lance at first, persistent in little save hatred of the Whigs, he had risen since 1842 to be head of the 'Young England' party, when suddenly, from the hour of his savage onslaught on Sir Robert Peel in the Corn-Law debate of 22d January 1846, he became the real leader of the Tory Protectionist squires, though their nominal chief for two years was Lord George Bentinck (q.v.). To this period belong *Coningsby* (1844), *Sybil* (1845), and *Tancred, or the New Crusade* (1847)—a trilogy intended to set forth the origin and condition of political parties, the consequent condition of the people, and the duties

of the church as a remedial agency. The 'Young England' creed in fact, *plus* the 'Asian mystery.' As Chancellor of the Exchequer and leader of the Lower House in the brief Derby administration of 1852, he coolly discarded Protection, and came off on the whole with flying colours; still, his budget was rejected, mainly through Mr Gladstone's attack on it; and Mr Gladstone succeeded him, in the Aberdeen coalition ministry. In 1858 he returned, with Lord Derby, to power, and next year introduced a petty measure of parliamentary reform—his 'fancy franchises' bill—whose rejection was followed by resignation. For seven long years the Liberals remained in office; and Disraeli, in opposition, displayed talents as a debater, and a spirit and persistency under defeat that won for him the admiration of his adversaries. With his return to the post of Chancellor of the Exchequer, in the third Derby administration (1866), came the strangest episode in all parliamentary history. He introduced and carried a Reform Bill (1867), far more democratic, more sweeping in its character, than one just rejected by the Conservatives and malcontent Liberals. True, a tentative measure was first put forward, every whit as unsatisfying as its predecessor. It would not do; none saw that sooner than Disraeli himself; so throwing overboard dissentient colleagues, among them Lord Cranborne (future Marquis of Salisbury), he produced a bill giving household suffrage in the boroughs, and widely extending the county franchise. It was 'a leap in the dark,' Lord Derby's own phrase; the leap at any rate was boldly taken. In February 1868 he succeeded Lord Derby as premier; but, in the face of a hostile majority, he resigned in the following December. On this occasion, Mrs Disraeli, in acknowledgment of her husband's services, was raised to the peerage as Viscountess Beaconsfield, an honour she survived only till 15th December 1872. The rich widow, fifty years old, of his first colleague, Mr Wyndham Lewis, she had married Disraeli in 1839. In 1870 appeared *Lothair*, a novel of which a reviewer in *Blackwood's* (Lord Salisbury, said rumour) observed that, 'on the whole, we had rather Mr Gladstone had written it.'

In 1874 Disraeli entered on his second premiership, the first two years of which were marked by the abolition of church patronage in Scotland, by an act to put down Ritualistic practices, and by one excellent measure, to protect British seamen against 'floating coffins,' which was forced on the government by Mr Plimsoll. But a spirited foreign policy was more to Disraeli's taste than humdrum domestic reforms. In 1875 he made Britain half-owner of the Suez Canal; and in 1876 he conferred on the Queen the new title of Empress of India, himself the same year being called to the Upper House as Earl of Beaconsfield. He had sat for Shrewsbury from 1841 to 1847, and thenceforward for Buckinghamshire. A free career was opened to his enterprise by the outbreak of insurrection in the Balkan Peninsula. Himself, he pooh-poohed the 'Bulgarian atrocities,' and was all for upholding Turkey as a bulwark against Russian aggression. When Constantinople seemed threatened, a British fleet was despatched to the Dardanelles, six millions were voted for military and naval purposes, and an Indian contingent was summoned to Malta. It was very magnificent; after all, though, it was not war, for the Berlin Congress (1878), which Lord Beaconsfield himself attended with Lord Salisbury, and which raised him to the zenith of his fame, gave back to Russia all she had lost by the Crimean war, and left Turkey the shadow of her former self. England's share was 'Peace with honour'—and with Cyprus, surrendered to us in an earlier secret engage-

ment. The Afghan and Zulu wars combined with commercial depression and with troubles in Ireland to sicken the country of an 'Imperial' policy; and the general election of 1880 returning a large Liberal majority, the government resigned before the meeting of parliament. The ex-premier employed his leisure in publishing *Endymion*, like so many of his novels the story of a fortunate politician. On 19th April 1881 he died at his London residence in Curzon Street; and the terms of his will precluding a public funeral in Westminster Abbey, he was buried at Hughenden, near Wycombe.

'It was one of the first principles of Mr Vivian Grey that everything was possible;' none ever exemplified that principle better than Lord Beaconsfield. Member of an alien and persecuted race, a race without settled resting-place or civil rights, he rose to be champion of a proud landed aristocracy, the trusted friend of Britain's queen, an arbiter of Europe's destinies. We stand too near him now, rightly to determine his claim to greatness; but this one may safely say—for praise or blame, according to men's judgments—that, in almost everything he was the very opposite of his great adversary, Mr Gladstone. He was a master of epigram, a splendid debater, rather than an orator; he possessed that first-rate requisite of statecraft, lack of zeal; he was not one to be idolised or detested. Throughout he was faithful to his two leading beliefs—in the Jewish race, and in intellect (incarnate both in himself); throughout he was loyal, ay, as a Swiss guard, to his adopted country. It may be hard to decide whether he was a genuine Tory, whether he was not chiefly a hater of the Whigs. At least, he was a true leader, for he led the Tories always whither he would himself, and often whither themselves they would never have gone. In his famous Edinburgh phrase (1867), he 'educated' his party. The masses owe to him their first enfranchisement, and Britain by him was for a while rehabilitated as one of the Great Powers. His novels are as puzzling as himself. They are brilliantly clever, most witty and entertaining; but one vainly looks in them for humour, pathos, any of the deeper qualities. They will always, however, be read, for the key they furnish to their author's character, and for their caricatures of his contemporaries—of Brougham as 'Foaming Fudge' in *Vivian Grey*, and Canning as 'Charlatan Gas'; of Lord Lyttelton as the hero of *Coningsby*, Croker as 'Rigby,' Mr Gladstone as 'Oswald Millbank,' of Palmerston, in *Endymion*, as 'Lord Roehampton,' and so forth.

See GLADSTONE, YOUNG ENGLAND, HUGHENDEN, PRIMROSE LEAGUE, and works cited under those articles. See, too, *Lord Beaconsfield's Correspondence with his Sister, 1832-52* (1886); his *Selected Speeches*, edited by Keble (2 vols. 1882); an article on his novels, by Lealie Stephen, in the *Fortnightly* (1874); G. C. Thompson's *Public Opinion and Lord Beaconsfield* (1886); Sir W. Fraser's *Disraeli and his Day* (1891); and the Lives of him by John Mill (1863), O'Connor (hostile, 1879), Brandes (Danish, 1878; Eng. trans. by Mrs Sturge, 1880); Cuheval Clarigny (French, 1880), Ewald (1882), Hitchman (3d ed. 1885), Keble (1888), and Froude (1890).

Bead, in Architecture, a small round moulding, sometimes called an *astragal*. It is of frequent occurrence in architecture, in picture-frames, and in other objects carved in wood.

Beadle is an inferior parish-officer chosen and appointed by the vestry. His business is to attend the vestry, to give notice of its meetings to the parishioners, to execute its orders, and generally to do and execute all the orders and business of the vestry and of the parish, as their messenger or servant. The same name is applied to the

messenger or crier of a court, to the inferior church-officer and attendant of a clergyman in Scotland, and, as *bedell*, to the bearer of the mace in public processions in a university.

Beads, a variety of personal ornament, made of glass, pottery, metal, bone, ivory, wood, jet, amber, coral, &c., and perforated so that they can be strung on threads and made into necklaces, bracelets, rosaries, &c., or worked on cloth as a kind of embroidery. Their use is of great antiquity, for they are found in the most ancient of the Egyptian tombs as decorations of the dead; and beads supposed to have been used in barter by the Phœnicians in trading with various nations in Africa are still found in considerable numbers, and are highly valued by the natives under the name of 'Aggry' beads. The origin of the name is unknown; but the coloured or variegated glass beads denoted by it are unquestionably of ancient manufacture; they are sometimes sold for more than their weight in gold. Ever since the 14th century, the manufacture of glass beads has been chiefly engrossed by the Venetians, and the glass manufacturers of Murano retain in large measure their ancient monopoly. Birmingham is the chief seat of the manufacture in England. The manufacture is curious: the melted glass, coloured or uncoloured, is taken from the pot by two workmen, who slightly expand the *gathering* of glass on the end of their blowing tubes. Each man then opens the hollow bulb of glass attached to his tube, and the two bulbs, while still soft and highly heated, are joined into one. This done, they walk rapidly away from each other in opposite directions, in a long shed like a small rope-walk, and draw the glass, which retains its tubular character given by the blowing, &c., into rods of great length, and often extremely small diameter. On cooling, which takes place very quickly, these long rods are broken up into short lengths of about a foot, and a small number of these shorter rods are placed on a sharp cutting edge, after being annealed, and are chopped into lengths. The roughly cut beads are next placed in an iron drum containing a mixture of plaster and charcoal dust. The drum is placed in or over a furnace, and a rotatory movement given to it. By this operation the short bits of tubes or perforated canes, which are softened by the heat, become rounded. The plaster and charcoal prevent the beads sticking together while soft. The beauty and infinite variety of Venetian glass beads are quite wonderful. They are sent to almost all parts of the world, but especially to African ports for the purposes of barter in the interior.

In Old English, *bede* signified 'a prayer,' and hence came to mean the small perforated balls of gold, silver, glass, ivory, or hard-wood, used for keeping account of the number of prayers repeated. This curious transfer of the name from what is counted—the prayers—to that which is used to count them, finds its exact parallel in Spanish, where *cuenta*, 'a bead,' is from *contar*, 'to count.' The old phrase 'to bid one's beads' means simply 'to say one's prayers;' and the modern phrase 'to tell one's beads,' literally 'to number one's prayers,' now means simply 'to say one's prayers.' A certain number of such beads strung on a thread makes a Rosary (q.v.). A *bedesman* or *bedeswoman* is one who prays for another. Persons of station and wealth in old times 'had regularly appointed bedesmen, who were paid to weary Heaven with their supplications.' Bedesmen frequently lived together in hospitals, and joined in prayers for their founders and benefactors, and hence *bedehouse* is synonymous with an almshouse. The King's Bedesmen in Scotland were licensed mendicants (see BLUE-GOWNS). A common form

of signature at one time was: 'Your bounden bedesman,' or 'Your humble bedeswoman,' instead of the modern 'Your obedient servant.'

Beagle (probably from Fr. *béguéule*, 'wide-throat'), the smallest variety of hound, formerly much used in England for hare-hunting. It has now been almost wholly superseded by the Harrier (q.v.), to which its name is sometimes given. The true beagle is smaller than the harrier, ranging from 10 to 15 inches in height at the shoulder (below which height it is difficult to obtain well-developed specimens), stout and compact in make, with long pendulous ears, smooth-haired, sometimes dark brown, with a streak or spot of white about the neck, but generally marked in the same way as foxhounds or harriers. The beagle is prized for its keen scent and perseverance; and although much distanced by the hare at first, it is almost sure to kill it. It was customary in England, in former times, when beagles were used, to follow the chase on foot, a hunting-pole being employed to assist in leaping. The cry of the beagle during the chase has been regarded as particularly musical. The smaller breeds, though extremely delicate animals to rear, were preferred, at first, perhaps, for the prolongation of the chase; and the diminutive size of a pack or 'cry' of beagles became a boast. See DOG.

Beak. See BILL.

Beale, LIONEL SMITH, a distinguished physician and physiologist, born in London in 1828, studied medicine at King's College, where he afterwards became professor. Besides the usual professional distinction, he is F.R.S., and a member of scientific societies in Sweden, New York, Italy, and Belgium. He has made numberless contributions to the *Lancet* and other special journals, and has written books of great value on microscopy, kidney diseases, urinary deposits, the distribution of nerves to voluntary muscle, the structure and growth of the tissues. More important still are his *Protoplasm, or Life, Force, and Matter* (1870); *Life Theories, their Influence upon Religious Thought* (1871); *Life and Vital Action in Health and Disease* (1875); *Principles and Practice of Medicine in Slight Ailments* (1880).

Beam (A.S. *bedm*, 'a tree'), any piece of wood, long like a tree. In the arts, the word has many special technical applications. It is the name, for instance, for part of a weaving-loom, of a balance, and of a stationary steam-engine. Beam in engineering is a strong stay of wood or of iron, for supporting lateral pressure. In ship-building it is applied to any of the transverse pieces of framing extending across the hull. In ship measurement it means breadth at the wales (see TONNAGE). The position of the beams, stretching across a ship at right angles to the keel, has given origin to many technical phrases used on shipboard. 'On the starboard beam' is applied to any distant point out at sea, at right angles to the keel, and on the starboard or right hand—as viewed from the stern—side of the ship. 'On the port beam' similarly applies to the left hand. 'On the weather beam' is that side of the ship which receives or is towards the wind. 'Before the beam' is the bearing of any object when seen more in advance than on the beam. 'Aft the beam' is the reverse of the expression just noted. 'On her beam-ends' is applied to the position of a ship when so much inclined to one side that the beams become nearly vertical.

Beaming is the art of winding the web on the weaver's beam in a manner suitable for weaving with regard to firmness and evenness. It is to some extent a special employment, followed by workmen trained as beamers. See WEAVING.

Beam-tree, WHITE (*Pyrus aria*, see **PYRUS**), a tree of 20-40 feet in height, a native of almost all parts of Europe and of corresponding climates in Asia, not uncommon in the mountainous districts of Britain, and frequently planted. It has been variously referred by botanists to several allied genera—*Sorbus*, *Crataegus*, and *Mespilus*. It has a straight erect trunk, and a round or oval head; the leaves are ovate, cut and serrated (in some varieties deeply lobed), white and downy beneath; the flowers in large terminal corymbs; the fruit scarlet, of the size of small peas. The fruit is acid and astringent, but becomes agreeable when in a state of incipient decay; it is sometimes called Sorb or Service-berry, and resembles the true Service (q.v.) in quality, although much smaller. Beer is made of it by fermentation, and by distillation it yields a powerful spirit. The wood is very hard, and of a fine close grain, yellowish white, but easily stained, and capable of taking a high polish. It is much used in turnery in making handles to knives and forks, wooden spoons, parts of various musical instruments, and cogs for the wheels of machinery.

Bean is a term used to designate the seeds of various plants, but in England is generally applied to those of different species belonging to the natural order Leguminosæ, as, for instance, the Common Bean (*Faba vulgaris*), the French, Kidney, or Haricot Bean (*Phaseolus vulgaris*), the Mollucca Bean (*Guilandina bonducella*), the Locust Bean (*Ceratonia siliqua*), the Tonka Bean (*Dipterix odorata*), and others. The term is also applied to the seeds of other plants widely different from each other and from the Leguminosæ. Of these the Pitchurim Bean, the seed lobes of *Nectandra puchury*, a relative of the Cinnamon and a native of tropical South America; St Ignatius' Bean, the seed of *Ignatia amara*, closely allied to *Strychnos* (q.v.), the source of strychnia, and itself strongly impregnated with the deadly qualities of that drug; the Egyptian or Sacred Bean, the seed of *Nelumbium speciosum*, an aquatic plant held in veneration by eastern peoples; and the remarkable Calabar Bean (q.v.), *Physostigma venenosum*, are a few of the many instances of plants whose seeds are popularly designated beans.

The common bean is a valuable source of food to man and animals in most of the temperate climates of the globe. It is of eastern origin, and was cultivated by the Egyptians, the Greeks, and the Romans, who introduced it into Britain. The varieties are numerous, several of them being adapted to field cultivation. It is only used as human food in this country in the green or unripe state, but the ripe beans are valuable as food for pigs, horses, and cattle. The Greeks and Romans looked upon it as in some respects a sacred plant; in the Roman festival of Lemuralia (see **LEMURES**) the father of the family threw black beans over his head, repeating certain traditional words. Pythagoras forbade his disciples to eat beans. Beans were used by the ancient Greeks and others in voting by ballot, and a survival of this custom has lingered in the election of kings and queens at Twelfth Night and other feasts.

Beans of the ordinary kind belong to one species, *Faba vulgaris*, natural order Leguminosæ. The common field varieties are the Tick Bean, the Scotch Horse Bean, the White Cluster, the Chat-teris, and the Winter Bean. The garden sorts (other than French beans) are larger, such as Longpods and Windsor, and are generally known as 'broad beans'—the proverbial 'beans and bacon,' used as food, especially by the poorer classes in England. Beans grow best on the heavier classes of soils, and are usually planted after wheat or some other grain crop. The most com-

mon method of preparing the land is to plough in farm-yard manure early in autumn. The common concentrated manures, other than potash, give as a rule poor results. The seed, 2 bushels to 2½ bushels per acre, may then be drilled, or sowing may be delayed till February, when the land is found to be mellowed by the winter frosts; 3 bushels to 3½ bushels of seed is then required of some spring-sown variety; 3 inches is a good depth for winter planting, and 2 inches in spring; 18 inches is a convenient distance between the rows, allowing space for thorough horse-hoeing and hand-hoeing, which is necessary, as the bean is a dirty crop. Beans may be broadcast and covered easily by harrowing, but the system, although simple, is objectionable, because the land cannot be properly cleaned when the crop is growing, and rather more seed is necessary. Sowing may be done every second furrow while the land is being ploughed, by means of Reeve's patent sower attached to the plough. This system is well suited to planting beans in autumn on land being broken up from grass. Autumn-sown beans grow the heaviest crop, if they escape severe winter frosts or frequent sudden change of temperature, which is apt to kill them; they are also ready to harvest in England with the wheat-crop, and can be cut without injury in bad weather during harvest, which is a great convenience, as well as a saving of expense. Spring-sown beans are rather later in coming to maturity, which means in England dead-ripe. In Scotland, beans are cut at an earlier stage, as the straw is at times used for horse fodder, being usually chopped and mixed with hay or oat straw. Ripened beans are ground into bean-meal, used as food for horses and cattle, and sometimes made into coarse bread. Beans take longer to dry after being put into sheaf than cereal crops, but are not so easily injured by bad weather; they are stacked in the same way as wheat, openings being left through the stacks for ventilation, to prevent moulding and injury to the seed. Beans are liable to be attacked by mildew when grown under unfavourable circumstances. At times a fungus appears in the form of discoloured patches on the leaves and pods. If these diseases are largely developed, the crop is best ploughed down as a green-manure after being laid by rolling. The most serious insect enemy is the *Bean aphid* or Black Dolphin, which begins at the top of the plant, and multiplying into myriads, covers and destroys it. If taken in time, the crop may be saved by cutting off the tops; if not, it has to be eaten off green by sheep, or if not required for food, it may be ploughed in. The humble-bee pierces through at the base of the flower to reach the honey, but this is not now thought to be injurious.

The French Bean (*Phaseolus vulgaris*) and the Scarlet Runner (*P. coccineus*) are grown in most English gardens, and the pods eaten as vegetables. They should be grown on rich land in a fine tilth state; fresh manure is injurious to them. The runners, being hardy, are sown towards the end of April in rows 2½ to 3 feet apart; French Beans, being delicate, are not sown till June, when frost is gone. The runners, if the tops are nipped off the vines in June, continue to yield until autumn frosts set in; French beans go off much earlier.

The beans grown in the United States are for the most part either haricots or closely allied kinds.

Bean-caper, a name applied to *Zygophyllum fabago*, whose flower-buds are used in the East as a substitute for capers.

Bean Feast is a name for an annual dinner given by employers to their workpeople—possibly so called because beans or a bean-goose figured prominently in the repast.

Bean Goose. See GOOSE.

Bean King's Festival. See TWELFTH DAY.

Bear (*Ursus*), a genus of large mammals in the order Carnivora. They differ from the related cat and dog types in being much less markedly carnivorous in habit and structure.

General Characters.—The stout body with thick legs and very short tail is covered with long shaggy fur; the entire under surfaces of the naked palms and soles rest on the ground in what is termed plantigrade fashion; the long claws are comparatively blunt, and are not retractile; the more or less elongated head, with short rounded hairy ears, runs out into a blunt somewhat hog-like snout; the bony external ear-bulb (tympanic bulla), so conspicuous on the skulls of most carnivores, is here rudimentary; the teeth have the same number and arrangement as those of the dog, but in association with the omnivorous and largely vegetarian diet the canines remain less developed, the special cutting teeth (sectorials) less sharp, and the molars have flattened and tuberculated grinding surfaces. Compared with the higher carnivores, bears are slow and less aggressive, relying more upon strength than cunning, and more or less contented with vegetable food. Though clumsy and heavy animals, they are thoroughly active, and some of them swim and climb with much agility. Most of them sleep through the winter, when their food is usually scarce, and it is at this season that the young cubs are born.

History.—In the earlier ages of civilisation bears bulked much more largely both in the imaginative and the practical life of men. In Greece the bear was king of the woods and sacred to Diana, though none the less a favourite object of the chase. He is a prominent figure in the mythologies and herotales of Northern Europe; and the same mixed reverence for a formidable antagonist is exhibited still by the North American Indians, who excuse themselves for eating it by an elaborate preface of compliment and respect. Bears used to be common beasts of chase in Europe, as many personal and local names abundantly testify. Large numbers were imported to Rome from various quarters, especially towards the decline of the empire, and supplied abundant material for the cruel conflicts of the amphitheatres. It is indeed on record that as many as a thousand bears were on one occasion exhibited. Bear-baiting prevailed to a much later date, and even in the time of Queen Elizabeth and her successor it was a recognised fashionable amusement to go to the bear-gardens, and see the victims worried to death by dogs. The name *Bruin* playfully given to bears is derived from the old poem *Reynard the Fox* (q.v.), where the bear has the name of 'Brown'; 'bruin' being the Dutch spelling of 'brown.'

Distribution.—The genus, though not a large one, is widely distributed in cold and temperate regions, and in the secluded uplands of some warmer countries. About ten species frequent various parts of Europe, Asia, and North America, while the African Bear (*Ursus crotcheri*) of the Atlas Mountains, and the South American Spectacled Bear (*U. ornatus*) of the Andes, are the only two representatives known to occur on these two continents. Their geographical range has been gradually becoming more and more restricted.

From the Pliocene strata of Europe and the deposits of the Siwalik Hills, two extinct species of bear have been dug up (*U. arvernensis* and *U. chrysus*). The Post-pliocene European caves are rich in remains of the Great Cave-bear (*U. spelæus*), along with those of the still abundant Grizzly. None of the above extinct forms differ markedly from existing species, but related genera

like *Arctotherium* and *Hyænarctos* lead back to such a primitive form as *Amphicyon*, which is supposed to be at 'the converging point of the dog and bear family lines.'

Different Forms.—The common Brown Bear (*Ursus arctos*), a variable species, inhabiting Europe and Asia, and regarded by some as identical with the black bear of North America. It used to be

Common Brown Bear (*Ursus arctos*).

found in Britain, but seems to have been exterminated in Scotland about the end of the 11th century. It measures about 6 feet in length, and stands 3 feet or so high at the shoulders. The long fur is predominantly dark brown, but very variable in colour. They eat all sorts of things—roots, berries, vegetables, ants, honey, fish, &c., and when these fail, other quadrupeds both small and large. The males and females only meet at pairing time, and the males are said to be more inclined to eat the cubs than in any way to care for them. The mother bear, on the other hand, is devotedly fond of her offspring, is ready to defend them at all costs, and when in their company is a most dangerous animal. In spite of the shuffling awkward gait, the brown bears are agile animals, climbing and swimming with ease, and able to attain a considerable speed in running. Their senses of smell and hearing are very acute. When hunger prompts them to attack large quadrupeds, their usual method is to hug their prey to death within their powerful arms. At the beginning of winter, when food is becoming scarce, but before the bear has had time to get out of condition, it seeks some sheltered nook in a cave or hollow tree, and after making itself snug and comfortable, falls into a winter sleep. During winter the female gives birth to from one to three cubs, which are cherished in the lair until spring. They remain blind for about a month, and are suckled for other two. When the bears reappear after their long rest they are thin and weak, and not unnaturally voracious. They attain a considerable longevity of 40 to 50 years. When kept in captivity they seem apt to sink into a phlegmatic mood, to which they appear to have a natural predisposition; they may, however, be taught to dance clumsily on their broad soles, and are said to have a good ear for music. Numerous stories are told, moreover, of their affectionate disposition when properly treated, though they are generally soured and crossbred by confinement. The skins are greatly valued, the flesh of the cubs is very palatable, bears' paws form a

special delicacy, and the fat or bear's grease is a well-known unguent. In Kamchatka, different parts of the bear, which is very common, are used in a great variety of ways—e.g. the intestines for window-panes.

The American Black Bear (*Ursus americanus*) is regarded by some as merely a variety of the former, from which it differs only in a few trivial characters, such as blacker fur, more slender snout, more convex forehead, and the like. It inhabits North America, is even more thoroughly vegetarian than the Eurasian form, and much less dangerous than the Grizzly. If food be abundant in the late autumn, and the bears in consequence in good condition, they fall into a winter sleep in an often snow-covered hiding-place. They are revered or almost worshipped, but at the same time hunted and eaten by the Indians. The skins are largely utilised for caps, rugs, &c., and value from £1 to £3. Closely related to the above forms are the Syrian Bear of Lebanon and the Palestine mountains, and the Indian White Bear of the Himalayas. The former species (*U. syriacus*) is repeatedly mentioned in the Bible, and was much used in the Roman exhibitions. The Himalayan Bear (*U. isabellinus*) is probably only a variety.

Quite distinct from the above is the Grizzly Bear (*U. horribilis*, *cinereus*, or *ferox*) of North America (from Mexico to 61° N.), a very large, strong, and fierce animal, chiefly at home on the Rocky Mountains. Though the characteristics of this powerful species are well marked, it was not till the explorations of Lewis and Clarke in 1802-6 that it was known to be a distinct type. The dark brown fur has a good deal of gray about the head, the ears are short and conical, the forehead broad and flat, the tail extremely short, the claws long, curved, and whitish. The adult Grizzly cannot climb trees. It is larger and stouter than the brown bear, more markedly carnivorous, and a very much more formidable beast of chase. It is said to be able to drag a buffalo carcass along, and is by far the most ferocious of bears. Attacked by man, it will pursue the assailant till the last. It is extraordinarily tenacious of life. A case is authenticated of a Grizzly receiving ten balls in its body, four of which passed through its lungs and two through its heart; it nevertheless swam half a mile, and did not succumb for twenty minutes. The skin is less valuable than that of the brown and black bears. The Indian or Tibetan Black Bear (*U. tibetanus*) and the Japanese species (*U. japonicus*) do not differ markedly from any of the preceding.

Somewhat different from the bears above described are a few forms for which separate genera are often erected. The Malayan Sun Bear (*Helarctos* or *Ursus malayanus*), inhabiting the Malay Archipelago, has a short, broad head, long extensile tongue, short, smooth, black fur, and remarkably long claws. Its maximum length is about 4½ feet. It does great damage to the coconut plantations. The Sloth Bear (*Melursus* or *Ursus labiatus*), which is still more divergent, inhabits the mountainous regions of Southern Asia and Ceylon. The first upper front tooth is absent or shed very early, and the other teeth are very small. Sloth bears are clumsy, uncouth animals, 5 to 6 feet long, with shaggy black fur, and with prolonged snout and lips which are utilised in sucking white ants out of their nests. They are for the most part contented with insects, honey, and vegetables, but often do considerable damage to the plantations. They admit of being readily tamed, and are often led about by Indian jugglers. The Spectacled Bear of the Peruvian and Chilean Andes (*Tremarctos* or *Ursus ornatus*) is a small form about 3½ feet long, with black fur, and

curious light-coloured rings round the eyes. A closely related species inhabits the island of Formosa.

The Polar or White Bear of the Arctic regions (over the whole Polar zone) (*Thalassarcos* or *Ursus maritimus*) has a comparatively narrow head, a pointed snout, small rounded ears, and a long neck.

Polar Bear (*Ursus maritimus*).

The grinding teeth are smaller and narrower than usual, and the soles of the feet more hairy. They feed principally on fish and seals, rarely attacking terrestrial quadrupeds, and not despising vegetable food in summer. They are the largest bears, often measuring 9 feet in length, and are proportionately strong. They move heavily, but not slowly over the ice, and are able to swim with much swiftness and endurance. They are more aquatic than any of the other species. Tales of polar explorations seem to show that the white bear is more aggressive towards man than any of the other species, and it is certainly the most carnivorous type. As food is abundant in winter, the males at least do not seem to hibernate. The she-bears, however, find sheltered nooks in the autumn, and bear one to three cubs in midwinter. The dwellers in the far north are fond of hunting the polar bear, and use the flesh for food, the fat for burning and curative purposes, the sinews as twine, and the skin for clothing. The genus *Ailuropus* is of some importance as a connecting link between the bears proper and other carnivores like the Panda (q.v.). See CARNIVORA.

Bear, BERE, or BEER. See BARLEY.

Bear, GREAT and LITTLE. See URSA MAJOR and MINOR.

Bear-baiting. In different countries, bears were formerly made objects of cruel sport, by being baited with dogs. In England it was a favourite amusement as early as the reign of Henry II., whilst at a later period a 'royal bear-ward' was an officer regularly attached to the royal household. The sport is frequently alluded to by Shakespeare and Ben Jonson, and it was not only encouraged by Queen Elizabeth, but it was placed under the particular patronage of her majesty. An order of the Privy-council, in July 1591, prohibited the performance of plays on Thursdays, because on Thursdays bear-baiting and the like pastimes had been usually practised; and an injunction to the same effect was sent to the Lord Mayor, wherein it is stated 'that in divers places the players do use to recite their plays to the great hurt and destruction of bear-baiting, and the like pastimes, which are maintained for her majesty's pleasure.' The queen's bears were kept at the Paris Gardens.

Bankside, Southwark, close to the river, named after Robert de Paris, a nobleman of the time of Richard II. Every town of importance at that time kept its bear, bear-ward, and pack of dogs. It is hardly necessary to add that bear-baiting, like bull and badger baiting, has long been unknown in England, having been prohibited by parliament in 1835.

Bearberry. The RED BEARBERRY (*Arctostaphylos uva ursi*) is a small trailing evergreen shrub, common in the Highlands of Scotland and in the Hebrides, and ranging over the northern parts of Europe, Siberia, and North America. It grows in dry, heathy, and rocky places. The flowers are in small crowded terminal racemes, of a beautiful rose colour. The berries are austere and mealy; they are said to be largely eaten by bears in northern regions. Grouse also feed on them. The dried leaves are used as an astringent and tonic medicine, especially in chronic affections of the bladder; but those of the Cowberry (*Vaccinium vitis idæa*) are substituted for them.—The BLACK BEARBERRY (*A. alpina*), of similar distribution, is a small trailing shrub, with black berries about the size of a sloe, which are relished by some.

Beard. The hair of the beard, moustache, and whiskers, is usually, though not always, of the same colour as the hair of the head, but somewhat shorter, stronger, and more wiry; it is invariably the colour of the hair on the eyebrows. The beard is the distinctive sign of manhood. In women, an incipient beard sometimes appears in the later years of life. Instances also occur of women with a beard almost equal to that of the male sex, the most celebrated 'bearded lady' being Margaret of Parma, regent of the Netherlands (1559). The beard is generally luxuriant in persons of the Slavonic and Celtic races. The aborigines of America, who are naturally almost beardless, make themselves entirely so by plucking out the hairs of the beard. In early times the beard was considered by almost all nations a sign of strength and an ornament of manhood, was carefully cherished, and even regarded as sacred. Among the Turks, Arabs, Persians, and many other nations, the removal of the beard was, and is yet to a very great extent, regarded as a severe punishment, and an extreme degradation. The Moslems, who are accustomed to swear by the beard of the prophet and by their own, carry combs constantly about with them for the purpose of dressing the beard. It is common to do so immediately after prayers, the devotee remaining on his knees during the operation. The hairs that fall out are then carefully picked up and preserved for entombment with their owner when he dies; frequently he himself deposits them beforehand in his destined tomb. The ancient Jews did not dye their beards, but the practice was common among the Arabs and Persians. The Arabs dyed the beard red, not only because dye of that colour (being merely a paste of *henna* leaves) was easily obtainable, but because it was an approximation to golden yellow, the colour recommended by their prophet Mohammed, who hated black, the colour the Persians preferred. The red beards of some of the suite of the sultan of Zanzibar caused no little surprise on the occasion of his visit to England in 1875. The Persian kings are said to have interwoven their beards with gold thread. It is customary among the Turks to anoint the beard with perfume, and to smoke it with incense. The Jews also anointed their beards. The Moslems commonly clipped their whiskers, the Jews did not. The Egyptians shaved their beards except in time of mourning, when they let them grow. They sometimes, however, wore false beards of plaited hair, varying in form and length with the rank of

the wearer. In Greece the beard was universally worn till the time of Alexander the Great, who ordered shaving, that the beards of his soldiers might not be laid hold of by their enemies in battle. Shaving was introduced among the Romans about 300 B.C. Pliny says Scipio Africanus was the first Roman who shaved every day. Subsequently, the first day of shaving was regarded by the Romans as the entrance upon manhood, and celebrated with great festivities. Under Hadrian, the beard was again allowed to grow, and this fashion prevailed till the time of Constantine the Great, when it was discontinued. Amongst the ancient West Goths and Burgundians, the removal of the beard was a sign of servitude, or loss of honour; nobles wore long beards. In the time of Charlemagne, the upper classes wore at most a moustache, while the common people cherished a full beard. The wearing of the beard, shorter or longer, was usual amongst the gentry from the 10th till the 12th century; subsequently throughout the middle ages the higher ranks shaved closely. Peter the Great compelled shaving in Russia by imposing a heavy tax upon the beard, and further, by having the beards of all whom he found wearing them plucked out by the roots, or shaved with a blunt razor. The beard was commonly worn in France till the time of Louis XIII., when, because the monarch was young and beardless, the fashion changed at the court and throughout the kingdom. A similar change took place in Spain on the accession of Philip V. The English wore beards for a considerable time after their invasion of Britain; and the beard appears to have been general among the people at the time of the Norman Conquest. But the Normans not only shaved themselves, but compelled the conquered to do so likewise; and many of the English chose rather to leave the country. It would appear, however, from sculptures on the tombs of kings and nobles, that not very long after the Conquest some of the Normans adopted the custom they had prohibited among the vanquished. Edward III. is represented on his tomb in Westminster Abbey with a very long beard. In the time of Elizabeth, beards were of the most varied and fantastic cut; and Taylor the 'Water-poet' satirises the extravagance of beards prevailing in that and the succeeding reign.

Under Charles I. were worn the moustache and peaked beard, familiar through Vandyke's portraits; in Charles II.'s reign moustaches only were worn; and the practice of shaving the whole face soon became general all over Europe. Among the clergy, too, there has been great diversity in the matter of beard-wearing at different times and in different countries. One is apt to associate the beards of the reformers with their Protestant tenets; but, as a matter of fact, all the popes were bearded from 1523 to 1691. Nowadays the clergy of the Eastern Church go bearded; of the Western, closely shaven. In the Anglican Church many of the inferior clergy have long worn beards; but Bishop Ryle of Liverpool (1880) was the first bearded prelate for many a day. The Worcester-shire militia claims to have been the first English regiment to adopt the moustache, in 1798, and to have borrowed the idea from the Austrian service. The growth of the full beard dates in France from the capture of Algiers (1830), in England from the Crimean war (1855). In France during the second empire, moustache and 'imperial' after the manner of Napoleon III. were usual. For a good while a beard was regarded by some of the continental governments as a badge significant of democratic sentiments, and as such was interfered with by police regulations. Certain nations, such as Poles and Hungarians, usually grow only moustaches. Side-whiskers were long an especially English

characteristic. Of late the tendency is to leave the individual to choose what particular portion of his face he will shave or leave unshaven. Physicians recommend that the beard should be allowed to grow on the chin and throat in cases of liability to inflammation of the larynx or of the bronchiae; and moustaches and whiskers are reckoned useful for prevention of toothaches and nervous diseases of the face. The beard is itself liable to the same diseases as the hair of the head, and to a peculiar disease (*mentagra*) occasioned or kept up by shaving, and consisting in a bark-like exudation from the inflamed sebaceous glands of the hair. See BARBER, HAIR.

Beard. GEORGE MILLER, an American physician, born May 8, 1839, in Connecticut, studied at Andover and Yale, and served during the war as an assistant-surgeon in the navy. In 1866 he settled in New York as a specialist in nervous diseases, on which he lectured for some years at the university. Besides suggestive books on eating and drinking, stimulants and narcotics, hay fever, sea-sickness, and sexual neurasthenia, Beard produced a valuable work on *American Nervousness* (1881), basing his results on the climate and mode of life in America. He died in New York, January 23, 1883.

Beard Moss. See USNEA, BROMELIACEÆ.

Bearer Company, an organisation for removing wounded soldiers from the field of battle to the dressing station or temporary hospital which is part of the equipment of the Bearer Company, and where first-aid can be given to them. The Bearer Company was first introduced into the British army in 1873, and comprises the following: 8 medical and 1 transport officers, 3 other officers for discipline and supply duties, 36 non-commissioned officers and men, who are trained sick-bearers of the Medical Staff Corps, 95 attendant untrained bearers from the Militia Reserve (q.v.), 11 Bâtmen (q.v.), and 47 drivers of the Army Service Corps. The uniform is blue with red piping, spiked helmet, and brown leather belts. Tents for the personnel and for the dressing stations are carried in 2 general service (transport) wagons, and a Bearer Company also has 33 Ambulances (q.v.), two surgery wagons, 2 equipment, 1 supply, and 3 water carts, requiring 109 horses. A modified organisation has been laid down for mountain warfare, consisting of 112 mules, of which 36 carry equipment, and 76 carry patients in cacolets or litters. One muleteer is allowed for every animal if they are untrained, and if trained, one to each pair of mules. Half a Bearer Company is attached to each Army Corps (q.v.) on active service, forming the link between the battalion stretcher-bearers and the field-hospitals.

Bearing, of a ship at sea, is the direction in which she sails, in reference to the points of the compass. On shipboard, seamen often conveniently refer the bearing of another ship or of an object on shore, not to the points of the compass, but to the line followed at the moment by their own ship's keel. Thus the bearing of the distant object may be *ahead*, *astern*, on the *starboard bow*, on the *port quarter*, &c.

Bear Lake. GREAT, in the north-west of Canada, in 65°-67° N. lat., and 117°-123° W. long., is the most northerly of that series of fresh-water seas—Huron, Superior, Winnipeg, Athabasca, Great Slave, Great Bear—which mark a continuous depression in the middle of the continent. Lying 246 feet above sea-level, Great Bear Lake is irregular in shape, with a surface estimated at 7012 sq. m., or not much smaller than Wales. It sends forth a river of its own name to the

Mackenzie. As the Arctic circle passes over it, the climate is severe.

Bear-leader. In former times, bears were led about with a chain, muzzled, and made to dance or stand on their hind-legs for popular entertainment; small dancing-dogs being usually added, for the sake of attractiveness. From this old practice, which is not yet quite extinct, has been taken the phrase 'bear-leader,' used jocularly to signify a discreet person who takes charge of a youth of rank on his travels to see the world.

Bearn, formerly one of the thirty-two provinces into which France was divided, and now forming the greatest portion of the department of Basses-Pyrénées. The inhabitants are chiefly Gascons with a strong infusion of Basque blood, and they speak the purest Gascon dialect. Bearn was a portion of Aquitania under the Romans, and after the downfall of that empire, under its ruling dukes it was a country of considerable importance. From the intermarriage of the ruling family, the Counts of Foix, with that of Navarre, sprang the French monarch Henry IV., who, because he was born and brought up in Bearn, was derisively called Le Béarnois. When he ascended the throne of France, Bearn, of course, virtually became a part of that country; but was only formally incorporated with it in 1620 by Louis XIII. See RIVAREZ, *Chansons et Airs populaires de Bearn* (1844); Bourdeau, *Ancienne Gascogne et Bearn* (2 vols. 1861-62); Cénac-Moncaut, *Histoire des Peuples Pyrénéens* (3d ed. 4 vols. 1874); and Lespy, *Grammaire Béarnaise* (2d ed. 1880).

Bear River, a stream of Utah, U.S., which rises in the Rocky Mountains to the E. of Salt Lake, flows NW. into Idaho, then bends round and again returns into Utah, falling into Great Salt Lake. The Bear and Steamboat springs on its banks, in Idaho, are impregnated with magnesia and other minerals. Coal is found at the crossing of the Central Pacific Railroad.

Bear's Grease. Under this name there are sold pomades, represented to be of great efficacy in nourishing and promoting the growth of hair. These so-called preparations of bear's grease are for the most part composed of purified beef-tallow, hog's-lard, or fat of veal, and spermaceti, along with almond oil, and some scenting ingredients. See HAIR.

Beas, an Indian stream, one of the 'Five Rivers' of the Punjab, rises in the Snowy Mountains of Kulu, at an altitude of 13,320 feet above sea-level. It flows through the Kangra Valley, and generally SW., to the plains of the Punjab, where it joins the Sutlej some 30 miles above Ferozpur, after a course of 290 miles.

Beast, NUMBER OF THE. See APOCALYPTIC NUMBER.

Beast-fables, stories in which animals play human parts, a widely-spread primitive form of literature, often surviving in more or less developed forms in the more advanced civilisations. No better example of its simplest form could be found than those stories of the negroes within the Southern States of America, which, through Harris's *Uncle Remus*, are now so well known to the reading public in England as well as America. The primitive natives of many parts of Africa still tell stories similar to these, and indeed they have acquired no very exalted notions of the inherent superiority of the human race, and admit without difficulty that the wisdom of the lower animals may be equal to their own. 'It is not a little curious,' says Sayce, 'to find that the chief home of the beast-fable should be Africa, and especially those backward tribes of Southern Africa whose

languages contain in their clicks the bridge that marks the passage of inarticulate cries into articulate speech. It seems as if the same conservatism which has preserved the animal sounds out of which language was developed, has preserved also a sympathy with the animal world, a memory of the close ties which unite us with it.' A striking instance of the naturalness of this form to the negro mind is seen in the fact that when the Váí tribe of Mandeng negroes in Liberia had developed a system of writing (1830-40), their first essays in composition were rude fables about beasts. Even in the advanced civilisation of ancient Egypt, the beast-fable held an important place; indeed, it is not improbable that here it may have made its first appearance, and that its popularity may have been in large measure due to the deep respect of the ancient Egyptian for the unerring instinct of animals, which went side by side with the animal-worship that was so marked a characteristic of his religion. We find the 'Lion and the Mouse' in a papyrus dating from 1200-1166 B.C.—the days of Rameses III. (Rhampsinitus) or Hak On—not as a rude and early attempt, but in a finished form postulating a much more ancient origin. Sir Richard Burton points out that from Kemi, the Black-land, it was but a step to Phœnicia, Judæa, Phrygia, and Asia Minor, whence a ferry led over to Greece. Here the apologue found its populariser in Aisôpos, whose name, involved in myth, possibly connects with Aithiops. The fabulist's era may be taken as contemporary with Solon (570 B.C.), about a century after Psammetichus (Psamethik I.) threw Egypt open to the restless Greek. From Africa, too, the fable would spread eastwards, and find a new home in the second great focus of civilisation in the Tigris-Euphrates Valley; while in later days the conquests of Alexander and his successors Hellenised the eastern world, and carried with their victorious arms every form of literature that had been fostered by the western peoples. Whether or no we can accept this historical chain as explaining the transmission of the beast-fable, at least it must be admitted that it is highly reasonable as a theory, and finds here and there strange verification. Even the Lokman of Arabian and Persian fable has a more than superficial likeness to the Æsop of history in his ugliness and his servile condition.

To us the allegory in such fictions seems fundamental, but it was not so to the primitive mind. To the savage the beast-fable is not nonsense, for he ascribes to the lower animals the power of speech and a nature resembling his own, and believes readily in transmigration and metamorphosis. Savage mythology is full of metamorphoses, and these happen still as contemporary events in Samoa and Sarawak. The belief in the affinity between man and animals in which primitive man has so nearly anticipated the would-be conclusions of certain advanced evolutionists belongs even now to half mankind, and most students of comparative religion maintain that in the other half the worship of animals represented an earlier stage in the religious evolution. The Australians, Kamchadales, Polynesians, North-American Indians, Basques, and Transylvanian Gipsies at the present day tell beast-fables into which as yet no moral lesson has entered. They have not yet reached the stage which Grimm, with the contempt of the true folklorist, describes as 'fables thinned down to mere moral and allegory,' and 'a fourth watering of the old grapes of an insipid moral infusion.' Among the Zulus and Hottentots we find the same stories, informed with the true Æsopic humour. Indeed it is, as has been seen, among the Bushmen, that pure beast-fables still exist in their simplest and fullest form, and it

is among them also that the art of drawing animals with considerable skill has been cultivated from time immemorial, as is evidenced by the rock-paintings of Southern Africa. In the Bushmen's beast-fables, the hare, as among the American negroes, the rabbit, plays much the same clever part as the fox in our European examples, and 'fables that illustrate the superior cunning of the hare can be traced,' says Sayce, 'from the Bari of Central Africa through Malagasy, Swahili, Kafir, and Hottentot, back to the Bushmen, where he is associated with what Dr Bleek calls "a most unpronounceable click," not otherwise found in the language.' But indeed we find the beast-fable in all parts of the world. Thus in Mr Gill's *Myths and Songs from the South Pacific*, a shark speaks and acts like a man, and Mr Ridley tells us the Australians ascribe human speech and action to the pelican and the musk-duck. The question need not now be raised whether these fables are really an indigenous native literature—it is sufficiently striking and significant to find here stories almost identical with those found among widely different people in widely distant regions. In our civilised world the animal-story lingered long after the moral beast-fable had become predominant. The crows of Æsop had croaked their wisdom through the medium of Babrius and Phædrus for a thousand years before the genuine beast-epic reached its highest development in *Reynard the Fox* (q.v.), belonging to the 12th century, but containing materials of a far earlier date. It is not a didactic poem, nor essentially even a satirical poem. Its charm lies in the admirable manner in which the characters of the various animals are sustained. Its influence in the middle ages may be partly understood from the fact that our common names *Reynard*, *Bruin*, and *Chanticleer* were originally the names of the characters in the great beast-fable.

Beast-fables, resembling more particularly the African, have been found in the cuneiform inscriptions of Babylonia. Four excellent examples have been preserved among the fragmentary records of Assur-bani-pal's library: the first narrating the actions of an eagle and a serpent; the second, of a fox and jackal; the third gives a discussion between a horse and an ox; while in the fourth a calf speaks. Jotham's story in the Book of Judges makes the trees talk to one another. So in the Izdubar legends of Babylonia, the trees answer Hea-bani.

Stories of the same nature are equally common farther east in Asia. Perhaps no book has been more widely popular than the fables of Bidpai (q.v.), translated first into Pehlevi or ancient Persian from an old Indian original, in part represented now by the *Panchatantra* (q.v.). The Indian fables differ from the Æsopic in this: in the former, animals act as men in form of animals; in the latter, animals are allowed to act as animals. Benfey ascribes this peculiarity of Indian conception to the belief in Metempsychosis (q.v.), and the exclusively didactic nature of Indian tales. All tales, therefore, in which animals play the part of human beings are Indian. As to the ultimate origin of beast-fables, Benfey's conclusion is that most fables about animals are western or Æsopic; that, on the contrary, the tales are Indian. In all our folk-tales the relations between the heroes and animals are usually kind or helpful. Nothing is more common than for the hero to do some kindness to a suffering animal, who afterwards shows his gratitude by some signal service to his benefactor at the moment of his own perplexity. Beasts and birds often carry grave secrets to favoured individuals, and so save them from unhappiness and

danger. If this feeling for animals is not of Buddhist origin, it is at least, as Cosquin points out, a prevailing Indian idea, and is certainly derived from the belief in metempsychosis, which effaces the distinction between man and the animal, and which in every living thing sees a brother. Benfey throws out the hint that metempsychosis may have come from Egypt. It does not occur in any of the Indo-European races save the Indians themselves, and undoubtedly intimate relations once existed between the Indus and the Nile. The Phœnicians were active intermediaries of commerce, and just as it is very probable they carried writing to India, they may have carried and re-carried many other elements of civilisation. Sir Richard Burton will have none of Benfey's refinement of distinction between the *Æsopic* and the Hindu apologue, and adds: 'The essence of the beast-fable is a reminiscence of *Homo primigenius*, with erected ears and hairy hide, and its expression is to make the brother brute behave, think, and talk like him with the superadded experience of ages. To early man the "lower animals," which are born, live, and die like himself, must have seemed quite human enough and on an equal level to become his substitutes. The savage, when he begins to reflect, would regard the carnivore and the serpent with awe, wonder, and dread; and would soon suspect the same mysterious potency in the brute as in himself: so the Malays still look upon the *Uran-utan*, or *Wood-man*, as the possessor of superhuman wisdom. The hunter and the herdsman, who had few other companions, would presently explain the peculiar relations of animals to themselves by material metamorphosis, the bodily transformation of man to brute, giving increased powers of working him weal or woe. A more advanced stage would find the step easy to metempsychosis, the beast containing the *Ego* (*alias* soul) of the human: such instinctive belief explains much in Hindu literature, but it was not wanted at first by the apologue.' There are many apologies in the *Arabian Nights*, but these are much longer and more involved in circumstance than the straightforward fables of *Æsop*, with their single event and simple moral. But these, despite their monumental antiquity, Burton regards as the offspring of a comparatively civilised age, when a jealous despotism or a powerful oligarchy threw difficulties and dangers in the way of speaking plain truths. He adds: 'A hint may be given, and a friend or foe can be lauded or abused as Belins the sheep, or Isengrin the wolf, when the author is debarred the higher enjoyment of praising them or dispraising them by name. And, as the purposes of fables are twofold, the speaking of brute-beasts would give a piquancy and a pleasantry to moral design as well as to social and political satire.' The danger of attempting openly to administer plain reproof to absolute Asiatic potentates may well have led to the invention of fables in which the lessons intended to be imparted were veiled under ingenious fictions of animals. Mr Clouston quotes the following story from an oriental historian of a tyrannical monarch having been reclaimed by such means. 'A wise and prudent vazir once related the following fable to his royal master: There was an owl in El-Basra and an owl in El-Mosul. And the owl of El-Basra said to the other one day: "Give me thy daughter in marriage to my son." Quoth the owl of El-Mosul, "I consent, on condition that thou give me as her dowry a hundred ruined villages." "That," replied the owl of El-Basra, "I cannot do at present; but if Allah spare the sultan another year, I will do what thou requirest." The sultan, deeply impressed by this simple fable, at once caused all the ruined towns and villages to be rebuilt, and henceforward studied to promote the

well-being of his subjects, and to render his rule easy and acceptable to them' (Clouston's *Popular Tales and Fictions*, 1887, vol. i., pp. 275-6).

See Benfey's masterly introduction to his translation of the *Panchatantra* (2 vols. Leip. 1859); Tylor's *Primitive Culture* (1871); chap. ix. of Sayce's *Introduction to the Science of Language* (2d. ed. 2 vols. 1883); the late I. G. N. Keith-Falconer's *Fables of Bidpai*, with its learned and suggestive introduction (1885); the introduction to Emmanuel Cosquin's *Contes populaires de Lorraine* (2 vols. 1886); and sect. iii. of the 'Terminal Essay' in vol. x. (1886) of Sir Richard Burton's *Thousand Nights and a Night*.

Beat, in Music, the English name of a grace or ornament, but of various signification, applied by different writers to the acciacatura, the mordent, and the reversed shake. From this uncertainty the word is now in disuse.—Beat also means a signal given by the hand or foot of the conductor to insure simultaneous performance—the hand or foot being raised on the unaccented, and lowered on the accented part of the bar.

BEATS are a wavy throbbing effect produced by the sounding together of two musical notes not in perfect unison or consonance, and are of practical importance in the art of tuning.

Beatification, an inferior degree of canonisation introduced in the 12th century, is a solemn act in the Catholic Church, by which the pope, after scrutinising the virtues and miracles of a deceased person, pronounces him to be among the blessed. After this his cultus is authorised, not universally as in canonisation, but in some district or order of the church. Beatification is generally a step towards Canonisation (q.v.).

Beating and Wounding. See ASSAULT.

Beating the Bounds. See BOUNDS.

Beaton, or BETHUNE, DAVID, Cardinal and Primate of Scotland, was a younger son of John Beaton of Balfour, in Fife. Born in 1494, he was educated at the universities of St Andrews and Glasgow, and afterwards studied theology and law at Paris. His tact and general abilities recommended him to the Duke of Albany, regent during the minority of James V., who in 1519 appointed him resident for Scotland at the French court. In 1525 he took his seat in the Scots parliament as abbot of Arbroath; his uncle, James Beaton, on being translated three years before from the archbishopric of Glasgow to St Andrews, having resigned to him that abbey, with half the rents. In 1528 Beaton was appointed Lord Privy Seal, and he is said to have been the adviser of James V. in instituting the College of Justice or Court of Session in Scotland, the idea of which was suggested by the constitution of the parliament of Paris. Beaton subsequently was twice sent ambassador to France, to negotiate James's two marriages. During his residence at the French court, he was admitted to all the privileges of a French citizen, and in 1537 was appointed by Francis I. Bishop of Mirepoix in Foix. After his return, he became coadjutor to his uncle in the see of St Andrews, and in 1538 was by Pope Paul III. elevated to the dignity of a cardinal. On his uncle's death in 1539, he succeeded him as Archbishop of St Andrews and Primate of Scotland, and soon commenced a persecution of the Reformers, already numerous and increasing. That he might be invested with supreme authority in all matters ecclesiastical, he obtained from the pope the appointment of *legatus a latere* in Scotland, and induced the king to institute a Court of Inquisition, to inquire after heretics in all parts of the kingdom. To maintain the French influence, and prevent all danger to the Catholic Church in

Scotland from a friendly connection with England, he contrived to frustrate a proposed meeting of King James with his uncle, Henry VIII., and even prevailed on the former to declare war against England. On James's death, after the disastrous overthrow of the Scots at Solway Moss (1542), Beaton produced a forged will, appointing himself and three others regents of the kingdom during the minority of the infant Queen Mary. The nobility, however, rejected the fictitious document, and elected the Earl of Arran regent, who then professed the reformed faith. Beaton next month was arrested and imprisoned, accused, among other charges, of a design to introduce French troops into Scotland, in order to stop the negotiations then in progress with Henry of England for a marriage between the young Prince of Wales and Queen Mary. He was soon after liberated, and reconciled to the regent, whom he induced to abandon the English interest, and publicly to abjure the reformed religion. On the young queen's coronation in 1543, Beaton was again admitted of the council, and appointed chancellor. During a provincial council of the clergy held at Edinburgh, at which he presided, he caused the celebrated preacher, George Wishart (q.v.), to be apprehended at Ormiston, and conveyed to the castle of St Andrews, where he was burnt at the stake, Beaton and other prelates witnessing his sufferings from a window. A conspiracy having been formed against him, at the head of which were Norman Leslie, Master of Rothes, and Kirkcaldy of Grange, Beaton was assassinated in his own castle of St Andrews, 29th May 1546. Though endowed with great talents, Beaton possessed little learning, and the ascription of certain works to him rests on no valid authority. Haughty, cruel, and intolerant, he was also licentious in the extreme. He had six natural children, three sons and three daughters—the latter married into families of distinction. One of his sons turned Protestant. The popular feeling about his death is happily expressed in the well-known contemporary lines of Sir David Lyndesay :

As for the cardinal, I grant
He was a man we weel could want,
And we'll forget him sune;
And yet I think the sooth to say,
Although the loon is weel away,
The deed was foully done.

Beaton, JAMES, an uncle of the cardinal's, took his M.A. at St Andrews in 1493, and rose rapidly to be Archbishop of Glasgow (1509), and of St Andrews (1522). One of the regents during James V.'s minority, he upheld the Hamilton against the Douglas faction. To the Edinburgh street-fight between them, famous in history as 'Cleanse the Causeway' (30th April 1520), he came wearing mail beneath his episcopal habit; but when Gawain Douglas, the poet-bishop of Dunkeld, besought him to stay the impending conflict, he swore on his conscience that he knew nothing thereof. His armour rattling as he struck his breast, called forth the rebuke, 'My lord, your conscience clatters.' The Hamiltons lost the day, and Beaton himself owed his life to Bishop Gawain. In 1526 he had, says Pitcottie, 'to keep sheep in Balgrumo,' whilst the Douglasses plundered his castle; but he was soon reinstated in his see, and figured as a zealous supporter of France, and an opponent of the Reformation, Patrick Hamilton and three other Protestants being burnt during Beaton's primacy. He died at St Andrews in 1539.—Another **JAMES BEATON**, nephew to the cardinal, was born in 1517, and in 1552 was consecrated to the archbishopric of Glasgow. He stood high in favour with the queen-regent, Mary of Lorraine, and it was to him that she handed the Lords' remonstrance (1557) with the remark,

'Please you, my lord, to read a pasquil.' On her death in 1560, he withdrew to Paris, and there he dwelt as Scotch ambassador, honoured by all men for his blameless life, till his death on 30th April 1603.

Beattie, JAMES, poet and essayist, was born at Laurencekirk, Kincardineshire, in 1735; studied at Marischal College, Aberdeen (1749-53); was for five years schoolmaster to Fordoun parish; in 1758 was appointed a master of Aberdeen grammar-school, and in 1760 professor of Moral Philosophy in his old college. He had published three or four volumes of verse, when in 1770 appeared his *Essay on Truth*, an onslaught upon Hume, which met with most extravagant success. The author himself naturally shared the popularity of his essay. He was introduced to George III.; dignitaries of the English Church solicited him to take orders, with promise of high preferment; but neglect has long since overtaken his treatise, which indeed is essentially commonplace. In 1771 appeared the first part of *The Minstrel*, and in 1774 the second. It overflows with a sweet poetic emotion, and is rich in picturesque descriptions, while the versification has a quiet fullness of melody. The author's gentle yet fervent spirit beats in every line. The poem describes 'the progress of a poetical genius born in a rude age, from the first dawning of fancy and reason, till that period at which he may be supposed capable of appearing in the world as a minstrel.' Beattie intended to have added a third part, but circumstances hindered him. In 1776 he published a series of essays on *Poetry, Music, &c.*, in 1783 *Dissertations Moral and Critical*, in 1786 *The Evidences of the Christian Religion briefly and plainly stated*, and in 1790-93 *The Elements of Moral Science*; all of which works are written in a clear and elegant style, and with a high appreciation of the good and beautiful. He died August 18, 1803. See his Life by Sir William Forbes (1806), and the Rev. W. R. Fraser's *History of Laurencekirk* (1880).

Beaucaire, a town in the French department of Gard, on the right bank of the Rhone, opposite Tarascon, with which it is connected by a suspension bridge, 14 miles SSW. of Avignon. Vessels enter its harbour by a canal communicating with the Mediterranean. A great fair, established in the 13th century, is held from the 15th till the 20th July. It was once one of the principal occasions of trade between France, Italy, and the East, and was attended by 300,000 strangers. The fair is still the scene of a brisk trade in silks, wines, oil, southern fruits, and leather. Pop. (1881) 8309.

Beauce, (1) a district of France, partly in the departments of Loir-et-Cher and Eure-et-Loire, of which the capital is Chartres. It contains some of the finest corn-land in France, and in early summer shows an almost uninterrupted plain of waving corn.—(2) Also a south-eastern county of the province of Quebec, Canada.

Bauchamp, ALPHONSE DE, historian and publicist, born at Monaco in 1767, entered the Sardinian military service, but in 1792, on the outbreak of the war with France, refused to bear arms against the republic, and obtained his discharge. Being, however, suspected of treasonable designs, he was imprisoned for some months. After his liberation, he returned to Paris, where, on the fall of Robespierre, he obtained a situation in the office of the minister of police, and had the surveillance of the press. Here he commenced his *Histoire de la Vendée et des Chouans* (3 vols. Paris, 1806; 4th ed. 1820), for which Fouché supplied the materials. As
